RE: **Former Thrifty Oil Co. Station #049**  
3400 San Pablo Avenue  
Oakland, CA 94612  
*First Quarter 2012, Status Report and Request for Low-Risk Closure*

Dear Mr. Khatri:

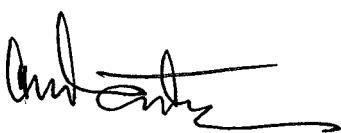

Enclosed is the *First Quarter 2012, Status Report and Request for Low-Risk Closure* prepared by Stratus Environmental, Inc. for former Thrifty Oil Co. (Thrifty) Station #049 located at 3400 San Pablo Avenue, Oakland, California (**Figure 1**). Presented in this report are the results of the *First Quarter 2012* groundwater-monitoring program.

Thrifty believes that the results of previously reported site assessment activities as well as the results of historical groundwater data indicate the hydrocarbon plume has been defined, is stable, is essentially restricted to the site property, will continue to diminish through natural attenuation, and the site poses very little to no threat to human health or the environment. Therefore, we respectfully request low risk regulatory case closure for this site.

I declare, under penalty of perjury, that the information and/or recommendations contained in this document are true and correct to the best of my knowledge.

Should you have any questions regarding this report, please contact Simon Tregurtha at (562) 921-3581 Ext. 260, or myself at Ext. 390.

Respectfully submitted,

Chris Panaitescu  
General Manager  
Environmental Affairs

## **PROFESSIONAL CERTIFICATION**

This report has been prepared under the guidance and review of the following individuals.

Kasey L. Jones  
Project Manager

Henry B. Ames, P.G.  
Supervising Geologist

**Summary of Monitoring and Sampling Activities**  
**Thrifty Oil Co. Station #049**  
**First Quarter 2012**  
**Reporting Period: 01/01/2012 through 03/31/2012**

**Site Information:**

Site address:	TOC SS #049 (ARCO #9535) 3400 San Pablo Avenue Oakland, CA
Global ID No.:	T0600101365
EDF Confirmation No.:	6818967700
Lead Agency No.:	Local #RO0000004
Lead Agency:	Alameda County Health Care Services (ACHCS)
Agency Contact:	Mr. Paresh Khatri / 510 777-2478
Project Manager:	Simon Tregurtha / 562-921-3581 ext. 260

**Field Activity:**

Groundwater wells onsite:	8
Groundwater wells offsite:	0
Date(s) monitored:	March 16, 2012
Date(s) sampled:	March 16, 2012
Groundwater wells gauged:	8
Groundwater wells sampled:	8
Purging method:	Bailer / Pump
Treatment / disposal method during sampling event:	Purge water contained in 55-gallon drums
Groundwater wells with free product:	0
Free product thickness (feet):	NA
Free product bailouts other than sampling event:	NA
Treatment / disposal method/free product bailouts:	NA

**Site Hydrogeology:**

Depth to groundwater (feet bgs):	2.78 to 4.42
Groundwater elevation (feet above mean sea level):	26.73 to 30.02
Groundwater gradient and flow direction:	Variable; mainly westerly
Consistent with previous quarter:	Varies slightly from previous sampling period

**Groundwater Conditions:**

TPHg concentration (ug/L):	ND<6.6 to 20,600 (MW-3)
Benzene concentration (ug/L):	ND<0.18 to 40 (MW-1)
Toluene concentration (ug/L):	ND<0.24 to 7,600 (MW-3)
Ethyl benzene concentration (ug/L):	ND<0.21 to 130 (MW-1)
Total Xylenes concentration (ug/L):	ND<0.45 to 220 (MW-1)
MTBE concentration (ug/L):	ND<0.19 to 59 (MW-3)
DIPE concentration (ug/L):	ND<0.2 (all wells)
ETBE concentration (ug/L):	ND<0.23 (all wells)
TAME concentration (ug/L):	ND<0.19 (all wells)
TBA concentration (ug/L):	ND<5.2 to 140 (MW-3)

**Remediation Activity (1) :**

Activity:	Soil excavation during UST removal
When Occurred:	March 1998
Hydrocarbon impacted soil removed:	1,093 tons (3,697 pounds of hydrocarbons, based on 1,691 mg/kg average soil concentration)

**Remediation Activity (2):**

System type:	Mobile HVDPE
Period Conducted	March 2010 and August/September 2010
Operation this Quarter (hrs):	0
Cumulative Operation (hrs):	840
GW removed this Quarter (gals):	0
Cumulative GW removed (gals):	25,349 (included in GWPT system gallonage below)
Vapor Phase Hydrocarbons removed this Quarter (lbs):	0
Cumulative Vapor Phase Hydrocarbons removed (lbs):	2,124.37

**Remediation Activity (3):**

System type:	GWPT
System start-up:	4/8/91 (Upgraded System Start-Up 6/21/04)
Operation this Quarter (hrs.):	0
Cumulative Operation (hrs.):	NA
GW discharge this Quarter (gal.):	NA
Total GW discharge (gal.):	2,684,436 (as of 4/28/2011)

**Total Remediation Achievements through March 31, 2012:**

Total groundwater removed (gals):	2,684,436
Total pounds of hydrocarbon removed (lbs):	5,821.37

**Site Description**

The former Thrifty Oil Co. Station #049 site is currently an ARCO-branded retail fueling facility located on the northeast corner of San Pablo Avenue and 34<sup>th</sup> Street in Oakland, California (**Figure 1**). The site facilities consist of two underground storage tanks, associated product piping and dispensers and a convenience store. The adjacent property, located immediately north of the subject site, is Shell Station #13-9619 (ACHCS LUST Case No. RO0000006).

**Recent Site History**

In March 2010, a five day multi-phase extraction/high-vacuum dual-phase extraction (MPE/HVDPE) event was performed at the site. Approximately 12,840 gallons of groundwater and 510.40 pounds of hydrocarbons (as vapor) were removed. The findings were presented in the *Continuous 5-Day Mobile High Vacuum Dual Phase Extraction Report and Workplan to Conduct a Continuous 30-Day Mobile High Vacuum Dual-Phase Extraction Event* (Workplan), which was submitted to the ACHCS on April 21, 2010.

In August and September 2010, a 30-day mobile HVDPE event was performed at the site. Approximately 12,869 gallons of groundwater and 1,613.97 pounds of hydrocarbons (as vapor) were removed. The very low vapor concentrations at the conclusion of the event indicate that asymptotic conditions have been reached and those insignificant hydrocarbon mass remains beneath the site. *The High Vacuum Dual Phase Extraction (HVDPE) Report*, dated September 13, 2010, was submitted to the ACHCS.

The groundwater extraction system (GWPT) was shut down on September 27, 2010 in order to conduct a rebound test. Second Semester 2010 groundwater samples were collected on October 20, 2010 and the GWPT system was re-started on October 27, 2010.

On November 30, 2010 two onsite confirmation soil borings (SB-1 and SB-2) and two off-site confirmation borings (SB-3 and SB-4) were installed and sampled. *Verification Sampling and Downgradient Groundwater Investigation Report Recommendation for Low Risk Regulatory Closure* (Report) dated December 27, 2010, was submitted to the ACHCS on January 11, 2011. The results of the soil samples indicated no detectable concentrations of total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX) or oxygenates in soil samples collected in the offsite soil borings SB-3 and SB-4 (with the exception of 0.0052 milligrams per kilogram [mg/kg] MTBE in sample SB-4-15), and low to moderate constituent concentrations in the soil samples from the onsite borings SB-1 and SB-2. Groundwater sample analytical results indicated no detectable concentrations for all constituents of concern with the exception of 12 micrograms per liter ( $\mu\text{g}/\text{L}$ ) MTBE from boring SB-4. Based upon the results of the site assessment activities as well as the results of historical groundwater data, low risk regulatory closure was requested for this site.

On January 26, 2011, Thrifty emailed Paresh Khatri of the ACHCS requesting case closure based upon the results of the December 27, 2010 report. In a letter dated March 31, 2011, the ACHCS stated that the site was ready for consideration for closure and they would notify Thrifty within 180-days of the result of their evaluation. In an email dated April 4, 2011, the ACHCS granted Thrifty permission to cease all groundwater monitoring and reporting activities while the case was being considered for closure.

On April 28, 2011, the groundwater remediation system was shut down. The groundwater remediation system had pumped and treated a cumulative total of 2,684,436 gallons of groundwater as of April 28, 2011 (**Table 4**).

On June 15, 2011, Thrifty emailed the completed case closure summary form to Paresh Khatri of the ACHCS.

In a letter dated February 23, 2012, ACHCS approved the termination of groundwater remediation efforts and requested that quarterly groundwater monitoring and sampling be initiated for one hydrologic cycle, beginning in the first quarter 2012.

### **Groundwater Monitoring**

As mentioned above, Thrifty shutdown the groundwater extraction unit on April 28, 2011 and the groundwater system has remained off since that date. As requested in the ACHCS letter dated February 23, 2012, the wells are to be monitored and sampled on a quarterly basis for one hydrologic cycle. The monitoring well locations are presented on **Figure 2**. On March 16, 2012, Stratus Environmental, Inc. (Stratus) monitored and sampled the eight on site groundwater monitoring wells (MW-1, MW-2R, MW-3, MW-4R, MW-5, MW-6, MW-7, and RW-1R). A groundwater elevation contour map for the First Quarter 2012 is presented on **Figure 2**. Groundwater elevation data indicates a generally westerly flow direction at a gradient of approximately 0.03 feet per foot.

The current groundwater elevation map shows the Thrifty site to be essentially cross-gradient of the Shell site. Historical groundwater flow directions reported in groundwater contour maps have consistently shown the Thrifty Station to be downgradient or cross-gradient of the Shell Station.

### Quarterly Groundwater Sampling

On March 16, 2012, Stratus gauged the depth to water and obtained groundwater samples from the eight monitoring wells. The groundwater samples were transported, in a chilled state, following strict Chain-of-Custody procedures, to a state-certified laboratory and analyzed for total petroleum hydrocarbons as gasoline (TPHg) in accordance with EPA Method 8015B. The samples were also analyzed for benzene, toluene, ethylbenzene, xylenes (BTEX), methyl tert butyl ether (MTBE), and other oxygenates in accordance with EPA Method 8260B. The current groundwater gauging and analytical results are included in **Table 1**. A summary of historical analytical sampling results for TPHg, BTEX, and MTBE is provided in **Table 2** and additional oxygenates in **Table 3**. Copies of the Stratus Field Data Sheets are provided in **Appendix A**. Stratus' groundwater sampling procedures are included in **Appendix B**. A copy of the laboratory analytical report is contained in **Appendix C**.

TPHg, benzene, MTBE, and tertiary butyl alcohol (TBA) isoconcentration maps are presented on **Figures 3, 4, 5, and 6**, respectively. Concentrations of TPHG were reported in six of the eight wells with concentrations ranging from 1,080 to 20,600 µg/L. Benzene was reported in wells MW-1 (40 µg/L), MW-2R (2.2 µg/L), MW-3 (38 µg/L), MW-4R (1.8 µg/L), MW-7 (20 µg/L) and MW-1R (2.2 µg/L). MTBE was reported in six of the eight sampled wells at concentrations ranging from 3.4 to 59 µg/L. TBA was reported in wells MW-1, MW-2R, RW-1R, and MW-3 at concentrations of 18 µg/L, 32 µg/L, 11 µg/L, and 140 µg/L, respectively. The oxygenates DIPE, ETBE, and TAME were not detected in the samples collected during the first quarter 2012 sampling event. None of the analytes tested for were detected in either of the two wells (MW-5 and MW-6) located on the eastern portion of the site.

Based on the available groundwater analytical data, the concentrations of TPHg and BTEX have decreased at the former remediation wells (MW-2R, MW-4R, and RW-1R). The concentrations of MTBE and TBA at these three locations increased slightly, to maximum values of 29 µg/L and 32 µg/L, respectively.

At outlying wells MW-1 and MW-7 (located hydraulically up gradient [to the east and northeast] of the remediation wells, the concentrations of TPHg and BTEX increased since the last sampling event. The concentrations of MTBE and TBA also increased slightly, to maximum values of 6.2 µg/L and 18 µg/L, respectively.

At outlying well MW-3 (located hydraulically cross gradient [to the north] of the remediation wells), the concentrations of TPHg and BTEX increased significantly since the last sampling event. The concentrations of MTBE and TBA also increased to maximum values of 59 µg/L and 140 µg/L, respectively. The increased hydrocarbon concentrations in this well are possibly due to an unauthorized release in the dispenser area by the current operator at the site (ARCO) and/or migration of contamination from the Shell site onto the Thrifty site. This conclusion is supported by the historical laboratory results of groundwater samples collected from MW-3 (see **Table 2**).

### **Discussion and Request for Low-Risk Closure**

As previously reported, the results of the site assessment activities conducted on November 30, 2010, as well as the results of historical groundwater data indicate the hydrocarbon plume has been defined, is stable, is essentially restricted to the site property. The main constituents of concern (benzene, MTBE, and TBA) are at generally low to moderate concentrations and the previous remedial activities have significantly reduced the hydrocarbon mass at this site. The identified contamination will continue to diminish through natural attenuation and the site poses very little to no threat to human health or the environment. Therefore, Thrifty has respectfully requested low risk regulatory closure for this site.

Although the ACHCS has requested continued groundwater monitoring activities, it should be noted that groundwater monitoring activities have been conducted on a regular basis for over 20 years. Based upon the results of the site assessment activities as well as the results of historical groundwater data, low risk regulatory closure should be granted for this site.

### **Closing Comments**

Interpretations expressed herein are based solely upon data collected and provided by Stratus and Associated Laboratories. Should you have any questions regarding this report or require any additional information, please contact Henry Ames at (714) 622-3912.

**NOTE:**

TPHg = Total petroleum hydrocarbons as gasoline

MTBE = Methyl tertiary butyl ether

ug/L = Micrograms per liter

feet bgs = Feet below ground surface

feet MSL - Feet at mean sea level

NP = No free hydrocarbon product

- = Not analyzed / Not available

\* MTBE 8020 / 8260

J = Flag indicating value between MDL and PQL

**Analysis:**

TPHg analyzed by EPA method 8015 modified for gasoline

Methyl-tert Butyl Ether (MTBE) analyzed by EPA method 8020 or 8260

On 7/21/04, 4/08/04, 7/10/03, 11/14/02, & 3/16/12 BTEX and MTBE analyzed by 8260B

Information prior to March 16, 2012 supplied by Thrifty Oil, Inc.

## **Appendix B**

### **Sampling and Analyses Procedures**

## APPENDIX B

### SAMPLING AND ANALYSIS PROCEDURES

---

The sampling and analysis procedures as well as the quality assurance plan are contained in this appendix. The procedures and adherence to the quality assurance plan will provide for consistent and reproducible sampling methods; proper application of analytical methods; accurate and precise analytical results; and finally, these procedures will provide guidelines so that the overall objectives of the monitoring program are achieved.

#### **Ground Water and Liquid-Phase Petroleum Hydrocarbon Depth Assessment**

A water/hydrocarbon interface probe is used to assess the liquid-phase petroleum hydrocarbon (LPH) thickness, if present, and a water level indicator is used to measure the ground water depth in monitoring wells that do not contain LPH. Depth to ground water or LPH is measured from a datum point at the top of each monitoring well casing. The datum point is typical a notch cut in the north side of the casing edge. If a water level indicator is used, the tip is subjectively analyzed for hydrocarbon sheen.

#### **Subjective Analysis of Ground Water**

Prior to purging, a water sample is collected from the monitoring well for subjective assessment. The sample is retrieved by gently lowering a clean, disposable bailer to approximately one-half the bailer length past the air/liquid interface. The bailer is then retrieved, and the sample contained within the bailer is examined for floating LPH and the appearance of a LPH sheen.

#### **Monitoring Well Purging and Sampling**

Monitoring wells are purged using a pump or bailer until pH, temperature, and conductivity of the purge water has stabilized and a minimum of three well volumes of water have been removed. If three well volumes can not be removed in one half hour's time the well is allowed to recharge to 80% of original level. After recharging, a ground water sample is then removed from each of the wells using a disposable bailer.

A Teflon bailer, electric submersible or bladder pump will be the only equipment used for well sampling. When samples for volatile organic analysis are being collected, the pump flow will be regulated at approximately 100 milliliters per minute to minimize pump effluent turbulence and aeration. Glass bottles of at least 40-milliliters volume and fitted with Teflon-lined septa will be used in sampling for volatile organics. These bottles will be filled completely to prevent air from remaining in the bottle. A positive meniscus forms when the bottle is completely full. A convex Teflon septum will be placed over the positive meniscus to eliminate air. After the bottle is capped, it is inverted and tapped to verify that it contains no air bubbles. The sample containers for other parameters will be filled, filtered as required, and capped.

The water sample is collected, labeled, and handled according to the Quality Assurance Plan. Water generated during the monitoring event is disposed of accruing to regulatory accepted method pertaining to the site.

## **QUALITY ASSURANCE PLAN**

Procedures to provide data quality should be established and documented so that conditions adverse to quality, such as deficiencies, deviations, nonconformities, defective material, services, and/or equipment, can be promptly identified and corrected.

### **General Sample Collection and Handling Procedures**

Proper collection and handling are essential to ensure the quality of a sample. Each sample is collected in a suitable container, preserved correctly for the intended analysis, and stored prior to analysis for no longer than the maximum allowable holding time. Details on the procedures for collection and handling of samples used on this project can be found in this section.

### **Soil and Water Sample Labeling and Preservation**

Label information includes a unique sample identification number, job identification number, date, and time. After labeling all soil and water samples are placed in a Ziploc® type bag and placed in an ice chest cooled to approximately 4° Celsius. Upon arriving at Stratus' office the samples are transferred to a locked refrigerator cooled to approximately 4° Celsius. Chemical preservation is controlled by the required analysis and is noted on the chain-of-custody form. Trip blanks supplied by the laboratory accompany the groundwater sample containers and groundwater samples.

Upon recovery, the sample container is sealed to minimize the potential of volatilization and cross-contamination prior to chemical analysis. Soil sampling tubes are typically closed at each end with Teflon® sheeting and plastic caps. The sample is then placed in a Ziploc® type bag and sealed. The sample is labeled and refrigerated at approximately 4° Celsius for delivery, under strict chain-of-custody, to the analytical laboratory.

### **Sample Identification and Chain-of-Custody Procedures**

Sample identification and chain-of-custody procedures document sample possession from the time of collection to ultimate disposal. Each sample container submitted for analysis has a label affixed to identify the job number, sampler, date and time of sample collection, and a sample number unique to that sample. This information, in addition to a description of the sample, field measurements made, sampling methodology, names of on-site personnel, and any other pertinent field observations, is recorded on the borehole log or in the field records. The samples are analyzed by a California-certified laboratory.

A chain-of-custody form is used to record possession of the sample from time of collection to its arrival at the laboratory. When the samples are shipped, the person in custody of them relinquishes the samples by signing the chain-of-custody form and noting the time. The sample-control officer at the laboratory verifies sample integrity and confirms that the samples are collected in the proper containers, preserved correctly, and contain adequate volumes for analysis. These conditions are noted on a Laboratory Sample Receipt Checklist that becomes part of the laboratory report upon request.

If these conditions are met, each sample is assigned a unique log number for identification throughout analysis and reporting. The log number is recorded on the chain-of-custody form and in the legally-required log book maintained by the laboratory. The sample description, date received, client's name, and other relevant information is also recorded.

## **Equipment Cleaning**

Sample bottles, caps, and septa used in sampling for volatile and semivolatile organics will be triple rinsed with high-purity deionized water. After being rinsed, sample bottles will be dried overnight at a temperature of 200°C. Sample caps and septa will be dried overnight at a temperature of 60°C. Sample bottles, caps, and septa will be protected from solvent contact between drying and actual use at the sampling site. Sampling containers will be used only once and discarded after analysis is complete.

Plastic bottles and caps used in sampling for metals will be soaked overnight in a 1- percent nitric acid solution. Next, the bottles and caps will be triple rinsed with deionized water. Finally, the bottles and caps will be air dried before being used at the site. Plastic bottles and caps will be constructed of linear polyethylene or polypropylene. Sampling containers will be used only once and discarded after analysis is complete. Glass and plastic bottles used by Stratus to collect groundwater samples are supplied by the laboratory.

Before the sampling event is started, equipment that will be placed in the well or will come in contact with groundwater will be disassembled and cleaned thoroughly with detergent water, and then steam cleaned with deionized water. Any parts that may absorb contaminants, such as plastic pump valves, etc. will be cleaned as described above or replaced.

During field sampling, equipment surfaces that are placed in the well or contact groundwater will be steam cleaned with deionized water before the next well is purged or sampled. Equipment blanks will be collected and analyzed from non-disposable sampling equipment that is used for collecting groundwater samples at the rate of one blank per twenty samples collected.

## **Internal Quality Assurance Checks**

Internal quality assurance procedures are designed to provide reliability of monitoring and measurement of data. Both field and laboratory quality assurance checks are necessary to evaluate the reliability of sampling and analysis results. Internal quality assurance procedures generally include:

### **- Laboratory Quality Assurance**

- Documentation of instrument performance checks
- Documentation of instrument calibration
- Documentation of the traceability of instrument standards, samples, and data
- Documentation of analytical and QC methodology (QC methodology includes use of spiked samples, duplicate samples, split samples, use of reference blanks, and check standards to check method accuracy and precision)

### **- Field Quality Assurance**

- Documentation of sample preservation and transportation
- Documentation of field instrument calibration and irregularities in performance

Internal laboratory quality assurance checks will be the responsibility of the contract laboratories. Data and reports submitted by field personnel and the contract laboratory will be reviewed and maintained in the project files.

## **Types of Quality Control Checks**

Samples are analyzed using analytical methods outlined in EPA Manual SW 846 and approved by the California Regional Water Quality Control Board-Central Valley Region in the Leaking Underground Fuel Tanks (LUFT) manual and appendices. Standard contract laboratory quality control may include analysis or use of the following:

- Method blanks – reagent water used to prepare calibration standards, spike solutions, etc. is analyzed in the same manner as the sample to demonstrate that analytical interferences are under control.
- Matrix spiked samples – a known amount of spike solution containing selected constituents is added to the sample at concentrations at which the accuracy of the analytical method is to satisfactorily monitor and evaluate laboratory data quality.
- Split samples – a sample is split into two separate aliquots before analysis to assess the reproducibility of the analysis.
- Surrogate samples – samples are spiked with surrogate constituents at known concentrations to monitor both the performance of the analytical system and the effectiveness of the method in dealing with the sample matrix.
- Control charts – graphical presentation of spike or split sample results used to track the accuracy or precision of the analysis.
- Quality control check samples – when spiked sample analysis indicates atypical instrument performance, a quality check sample, which is prepared independently of the calibration standards and contains the constituents of interest, is analyzed to confirm that measurements were performed accurately.
- Calibration standards and devices – traceable standards or devices to set instrument response so that sample analysis results represent the absolute concentration of the constituent.

Field QA samples will be collected to assess sample handling procedures and conditions. Standard field quality control may include the use of the following, and will be collected and analyzed as outlined in EPA Manual SW 846.

- Field blanks – reagent water samples are prepared at the sampling location by the same procedure used to collect field groundwater samples and analyzed with the groundwater samples to assess the impact of sampling techniques on data quality. Typically, one field blank per twenty groundwater samples collected will be analyzed per sampling event.
- Field replicates – duplicate or triplicate samples are collected and analyzed to assess the reproducibility of the analytical data. One replicate groundwater sample per twenty samples collected will be analyzed per sampling event, unless otherwise specified. Triplicate samples will be collected only when specific conditions warrant and generally are sent to an alternate laboratory to confirm the accuracy of the routinely used laboratory.
- Trip blanks – reagent water samples are prepared before field work, transported and stored with the samples and analyzed to assess the impact of sample transport and storage for data quality. In the event that any analyte is detected in the field blank, a trip blank will be included in the subsequent groundwater sampling event.

Data reliability will be evaluated by the certified laboratory and reported on a cover sheet attached to the laboratory data report. Analytical data resulting from the testing of field or trip blanks will be included in the laboratory's report. Results from matrix spike, surrogate, and method blank testing will be reported, along with a statement of whether the samples were analyzed within the appropriate holding time.

Stratus will evaluate the laboratory's report on data reliability and note significant QC results that may make the data biased or unacceptable. Data viability will be performed as outlined in EPA Manual SW 846. If biased or unacceptable data is noted, corrective actions (including re-sample/re-analyze, etc.) will be evaluated on a site-specific basis.

FAX 714-538-1209

### SAMPLE ACCEPTANCE CHECKLIST

#### Section 1

Client: TOL

Date Received: 3-20-12

Sample(s) received in cooler: Yes

Shipping Information:

Project: \_\_\_\_\_

Sampler's Name: Yes No

No (Skip Section 2)

#### Section 2

Was the cooler packed with:  Ice  Ice Packs  Bubble Wrap  Styrofoam  
 Paper  None  Other \_\_\_\_\_

Cooler or box temperature: 50C

(Acceptance range is 2 to 6 Deg. C.)

#### Section 3

Was a COC received?

YES NO N/A

Is it properly completed? (IDs, sampling date and time, signature, test)

Were custody seals present?

If Yes - were they intact?

Were all samples sealed in plastic bags?

Did all samples arrive intact? If no, indicate below.

Did all bottle labels agree with COC? (ID, dates and times)

Were correct containers used for the tests required?

Was a sufficient amount of sample sent for tests indicated?

Was there headspace in VOA vials?

Were the containers labeled with correct preservatives?

Was total residual chlorine measured (Fish Bioassay samples only)? \*

\*: If the answer is no, please inform Fish Bioassay Dept. immediately.

#### Section 4

Explanations/Comments

#### Section 5

Was Project Manager notified of discrepancies: Y / N N/A

Completed By: JDS/JLC

Date: 3-20-12

Log-in Reviewed by: \_\_\_\_\_
