1. INTRODUCTION

Nestlé USA, Inc. (Nestlé) has retained ETIC Engineering, Inc. (ETIC) to provide environmental services for the Nestlé facility at 1310 14th Street, Oakland, California (Figure 1).

This report presents the results for quarterly sampling for the first and second quarters of 2000, conducted in February and April 2000, and the results for well gauging and remediation system monitoring.

During the first quarter of 2000, the following wells were gauged and sampled:

Gauged	MW3, MW6, MW25-MW30, MW32, MW33, PR45, PR52, PR53, PR54, PR64, V55, V72, V84, 29 (CC1), 30 (CC2), 223, and 239
Sampled	MW3, MW25-MW30, MW32, MW33, PR45, PR52, PR53, PR54, PR64, V55, V72, V84, 29 (CC1), 30 (CC2), 223, and 239

During the second quarter of 2000, the following wells were gauged and sampled:

Gauged	MW3, MW25-MW30, MW32, MW33, PR45, PR52, PR53, PR54, PR64, V55, V72, V84, 29 (CC1), 30 (CC2), 223, and 239
Sampled	MW3, MW25-MW30, MW32, MW33, PR45, PR52, PR53, PR54, PR64, V55, V72, V84, 29 (CC1), 30 (CC2), 223, and 239

Additional wells were gauged for non-aqueous phase liquid (NAPL), as discussed in Section 2.1 below.

During the fourth quarter of 1997 and first quarter of 1998, a multiphase extraction (MPE) remediation system was installed. The MPE system began operation in August 1997, and was upgraded in June through September 1998. Operation of the MPE system was continued through June 2000.

Per discussions with the Alameda County Health Agency (ACHA) and the Regional Water Quality Control Board (RWQCB) in November 1999, it was decided that the remediation system would operate through the end of the second quarter 2000. At the end of this year, the groundwater monitoring results will be compared between the periods when the remediation system was operated (first and second quarters) and was not operated (third and fourth quarters). If concentrations are stable or declining, a request for environmental case closure will be submitted. The request for closure will be supported by a Comprehensive Site Characterization Report, which will include the results of a risk assessment, and a Risk Management Plan, both of which will be submitted to the ACHA and the RWQCB during the third quarter of 2000.

2. FIELD PROCEDURES

2.1 NAPL GAUGING

A total of 43 wells were gauged from early February 2000 to mid-June 2000 to determine the presence and thickness of NAPL, using an interface probe. The set of wells used to monitor the location of NAPL in the subsurface has varied as remediation has progressed, but in general 40 or more wells are gauged each quarter.

2.2 PURGING AND SAMPLING OF GROUNDWATER

After depths to groundwater were measured in wells in February and April 2000, each well to be sampled was purged, using a dedicated PVC pipe attached to an aboveground pump. Approximately 3 well casing volumes of water were removed from each well. Wells that dewatered prior to removal of 3 casing volumes were allowed to recharge at least 80 percent prior to sampling. The temperature, pH, and electrical conductance of the purged water were recorded at approximately each well casing volume as each well was purged. When the parameters were stable (less than 10 percent change from the previous reading for temperature and electrical conductance, and less than 0.1 pH unit change for pH), purging was stopped and groundwater samples were collected. The samples were collected from each well with factory-cleaned disposable polyethylene bailers and poured into 40-ml glass VOA vials and 1-liter amber glass jars and placed in an ice-filled cooler. All samples were handled and transported under chain of custody.

The samples were submitted to the Nestlé Quality Assurance Laboratory, where they were analyzed for Total Petroleum Hydrocarbons as gasoline (TPH-g) and as diesel (TPH-d) by the California DOHS method described in the October 1989 LUFT Field Manual, for benzene, toluene, ethylbenzene, and xylenes (BTEX) and methyl t-butyl ether (MTBE) by EPA Method 8021, and for halogenated volatile organic compounds (HVOCs) by EPA Method 8021.

3. SUMMARY OF RESULTS

3.1 NAPL GAUGING AND MONITORING

NAPL monitoring data for a representative number of wells monitored since November 1993 are summarized in Table 1. Of the 43 wells monitored from 7 February 2000 to 12 June 2000, 29 wells contained no detectable NAPL, 8 wells contained between a sheen and 0.01 feet of NAPL, 3 wells contained between 0.02 and 0.09 feet of NAPL, and 3 wells contained between 0.10 and 0.99 feet of NAPL. No wells contained NAPL at a thickness of 1.0 feet or greater. The spatial distribution of these wells containing the different thicknesses of NAPL is shown in Figure 2.

Gauging results indicate that the MPE system is effective and has decreased the amount of NAPL in the subsurface. The results for some of the wells that have historically contained NAPL are summarized below.

Well	Maximum NAPL Thickness (feet)

3.2 DEPTH TO GROUNDWATER IN MONITORING WELLS

The depth to groundwater in monitoring wells on 8 February 2000 ranged from 6.64 (MW29) to 8.36 (MW30) feet, and groundwater elevations ranged from 5.94 (MW26) to 6.67 (MW32) feet above mean sea level (Table 2). A groundwater elevation contour map for 8 February 2000 is shown in Figure 3. The direction of groundwater flow in February was toward the northwest, at a gradient of approximately 0.002 to 0.006 feet per foot. Field documentation is provided in Appendix A.

The depth to groundwater in monitoring wells on 26 April 2000 ranged from 5.50 (MW25) to 7.41 (MW30) feet, and groundwater elevations ranged from 6.52 (MW26) to 7.67 (MW32) feet above mean sea level (Table 2). A groundwater elevation contour map for 26 April 2000 is shown in Figure 4. The direction of groundwater flow in April was toward the north-northwest, at a gradient of approximately 0.002 to 0.005 feet per foot. Field documentation is provided in Appendix A.

3.3 ANALYSIS OF SAMPLES

The analytical results for the groundwater samples collected in February and April 2000 are presented in Table 3, along with previous results. The distribution of BTEX, TPH-g, TPH-d, and HVOCs in the groundwater samples is shown in Figures 5 and 6. Laboratory analytical reports and chain-of-custody documentation are included in Appendix B.

4. REMEDIATION SYSTEM MONITORING

The monitoring results through 26 May 2000 for the MPE water and vapor treatment systems are summarized in Tables 4 and 5, respectively. An estimated 621 pounds of hydrocarbons has been removed from extracted water, and an estimated 538 pounds of NAPL has been removed by the oil/water separator (Table 4). The estimated amount of NAPL fluctuates due to accumulation of water in the product storage tank. An estimated 9,687 pounds of hydrocarbons has been removed from extracted soil vapor (Table 5). Figure 7 graphically depicts the number of pounds of hydrocarbons removed from groundwater, vapor effluent, and as free product. An estimated combined total of 10,846 pounds of hydrocarbons has been removed and treated since system installation.

The groundwater portion of the MPE system consists of two 200-pound liquid phase carbon vessels in parallel, followed by two 200-pound liquid phase carbon vessels in parallel, followed by two 1,000-pound liquid phase carbon vessels in series. The vapor portion of the MPE system consists of air/water separators and a thermal oxidizer which burns extracted soil vapors and vapor-phase hydrocarbons stripped from groundwater and recovered product.

The MPE system was operated in a cycled mode during this reporting period. The cycle was 1 week of operation followed by 2 weeks of downtime. The MPE system has been operated in a cycled

mode to allow subsurface conditions to equilibrate after vapor concentrations and free product recovery decline. During operation, the MPE system was adjusted to extract from different wells, focusing on those that had measurable NAPL. Operation of the MPE system was discontinued at the end of June 2000 to assess NAPL accumulation and groundwater concentrations during the next two quarters. Wells at the site will continue to be gauged for NAPL monthly through the end of the year 2000.

5. WORK PROPOSED FOR THE NEXT TWO QUARTERS

During the third and fourth quarters of 2000, groundwater in selected wells will be sampled and analyzed for BTEX, TPH-g, TPH-d, and HVOCs.

Approximately 43 wells will be gauged monthly for NAPL.

A Comprehensive Site Characterization Report, which will include the results of a risk assessment, and a Risk Management Plan will be submitted to the ACHA and the RWQCB during the third quarter of 2000.

1 Percent operational = hours of blower operation / days between readings * 24 hours/day * 100%

2 Average operational flow rate = total flow in period/hours of operation in period

3 Est TPH Pounds Removed = Average Influent conc (µg/L) [using latest sampling] * period flow total (gallons) * 1 lb/454 g * 1/1,000,000 * 3 785 L/gallon

4 Est Cumulative Pounds Free Product Removed assumes all liquid tank is 100% product, specific gravity = 0 8

gpm = gallons per minute

Total TPH = Total of TPH-gas and TPH-diesel

µg/L = micrograms per liter

CFM = cubic feet per minute
FID = Flame Ionization Detector
TPH-g = Total Petroleum Hydrocarbons, as Gasoline
ppmv = parts per million by volume

* Estimated Pounds TPH Removed = Average Influent conc.(ppmv) * Average flowrate (CFM) * Hours of Operation * 60 min/hour * 1/1,000,000 ppm * 110 g/mole *1/24 055 L/mole * 1 lb/454 g * 28.32 L/ft3
(assuming average TPH-g molecular weight is 110 g/mole, at 20° C temperature)
