May 16, 2012

Paresh C. Khatri Hazardous Matariala Specialist Alameda County Environmental Health [13]Harbor Bay Parkway, Suite 250 Alameda, CA 94502-6577

Subject: Alameda Gas 1310 Central Avenue, Alameda Fuel Leak Case No. RO0000022

Dear Mr. Khatri:

Baclused is the Quarterly Groundwater Monitoring Report - First Quarter 2012 for the subject LUFT site. In compliance with state and local regulations, electronic submittals of this report have been uploaded to the Geotracker database and the Alameda County fip website.

I deplace under penalty of perjury that the information and/or recommendations contained in the attached report are true and correct to the best of my knowledge.

Please call Tim Cook at Cook Environmental Services at (925) 478-8390 if you have questions or comments in regards to the technical content of this report.

Very truly yours, Alamona Gas Joseph Zadik Nissan Saldian

ce: Tim Cook, Cook Environmental Services, Inc.

VOA	volatile organic analysis

## **INTRODUCTION**

This report presents the results of the first quarter groundwater monitoring event for 2012 conducted by Cook Environmental Services, Inc. (CES) at Alameda Gas (the "Site"), located at 1310 Central Avenue, Alameda, California. The groundwater monitoring event described in this report was conducted on March 29, 2012 and is part of an ongoing subsurface investigation of petroleum hydrocarbons in soil or groundwater that was caused by an unauthorized release of petroleum fuels from the UST system (tanks, associated piping and dispensers) formerly located at the Site. CES is conducting this investigation on behalf of the responsible parties, Mr. Leon Zektser, Mr. Nissan Saidian and Mr. Joe Zadik. The Alameda County Environmental Health Services (ACEHS) is the lead regulatory agency overseeing Site investigation and remediation and the ACEHS case number is RO0000022. The groundwater monitoring program consists of the collection and laboratory analysis of groundwater samples from five groundwater monitoring wells in order to assess concentrations of petroleum hydrocarbon compounds in shallow groundwater.

### Site Description and Physical Setting

The Site is currently a retail gasoline fueling station located in an area of mixed commercial and residential properties in the south-central part of the island of Alameda. The Site is located at the intersection of Encinal Avenue, Sherman Street, and Central Avenue. A Site location map is shown on **Figure 1** and a Site plan showing physical features and groundwater monitoring well locations is shown on **Figure 2**.

The Site is relatively flat and the investigation area has a surface elevation of approximately 25 feet amsl. San Francisco Bay and the Alameda Estuary are located approximately one-half mile to the south.

### Site History

In May 1996, Petrotek removed three gasoline USTs including one 10,000-gallon, one 7,500-gallon and one 5,000-gallon UST from the western corner of the Site. A 500-gallon waste oil UST adjacent to the building, was also removed from the southern portion of the Site. Fuel dispensers and associated product piping were also removed.

Free-phase petroleum hydrocarbons were observed floating on the groundwater surface in the gasoline UST excavation following removal of the USTs. According to the laboratory analysis, a groundwater sample collected from the gasoline UST excavation contained 2,800 micrograms per liter ( $\mu$ g/L) of total petroleum hydrocarbons as gasoline (TPH-g) and 100  $\mu$ g/L benzene. Soil samples collected from the same excavation contained up to 5,000 milligrams per kilogram (mg/Kg) of THP-g and 31mg/Kg benzene. Soil samples collected beneath the former dispenser island contained up to 6,800 mg/Kg TPH-g and 63 mg/Kg benzene. A ground water sample collected in the waste oil UST excavation contained 35,000  $\mu$ g/L of total petroleum hydrocarbons as diesel (TPH-d) and motor oil range hydrocarbons, and 1,300  $\mu$ g/L of TPH-g. These results are documented in a *UST Closure Report* submitted by Petrotek in May 1996.

Petrotek reportedly excavated and disposed of approximately 600 cubic yards of petroleum hydrocarbon-impacted soil from the UST excavations. It does not appear that confirmation soil samples were collected following removal of the petroleum hydrocarbon-impacted soil. Approximately 15,000 gallons of ground water were also removed from the excavations, treated and discharged to the sanitary sewer. Two new gasoline USTs, dispensers and product piping were installed in the same UST excavation after the petroleum hydrocarbon-impacted soil and ground water were removed.

In November 1998, All Environmental Inc. (AEI) advanced 14 soil borings on the Site and collected soil and groundwater samples for analysis. Up to 5,900 mg/Kg of TPH-g was detected in soil samples collected from the borings. Up to 120,000  $\mu$ g/L TPH-g and 7,200  $\mu$ g/L benzene were detected in groundwater samples from the borings.

In October 1999, HerSchy Environmental installed three monitoring wells at the Site. The initial sampling yielded up to 43,000  $\mu$ g/L TPH-g, 8,700  $\mu$ g/L total petroleum hydrocarbons as diesel (TPH-d), 480  $\mu$ g/L benzene, and 1,600  $\mu$ g/L methyl tert-butyl ether (MtBE) were detected in groundwater samples from the wells. The groundwater flow direction was southwesterly under a gradient of 0.0085. Well construction details are presented in **Table 1**.

On May 16, 2000, Aqua Science Engineers (ASE) began quarterly monitoring at the Site. Groundwater samples collected from MW-1 contained 20,000  $\mu$ g/L TPH-g, 38  $\mu$ g/L benzene, 6.3  $\mu$ g/L toluene, 740  $\mu$ g/L ethyl benzene, and 1,600  $\mu$ g/L total xylenes. No MtBE or other oxygenates were detected in the sample from MW-1. No hydrocarbons were detected in the groundwater sample taken from MW-2. The groundwater sample from MW-3 contained 17,000  $\mu$ g/L TPH-g, 2,800  $\mu$ g/L benzene, 60  $\mu$ g/L toluene, 380  $\mu$ g/L ethyl benzene, 190  $\mu$ g/L total xylenes, 990  $\mu$ g/L MtBE, 9.1  $\mu$ g/L tert-amyl methyl ether (TAME), and 350  $\mu$ g/L tert butyl alcohol (tBA).

On July 28, 2000, ASE advanced 12 Geoprobe borings (borings BH-A through BH-L) to further delineate the lateral and vertical extent of petroleum hydrocarbons and collected soil and grab groundwater samples from each borings. Laboratory analysis detected 0.00061 mg/Kg of MtBE in a soil samples collected from 3.0 feet (ft) below ground surface in boring BH-J. There were no petroleum hydrocarbons or oxygenates detected in soil samples from the other 11 borings, however, petroleum hydrocarbons and oxygenates were detected in grab groundwater samples collected from 5. D, I, J, K, and L.

In December 2002, ASE conducted an investigation to assess whether subsurface utility line trenches may provide a groundwater movement pathway. ASE concluded that it did not appear that the utility line trenches act as groundwater movement pathways. This conclusion was based on ASE's assumption that the utility line trench backfill material is native sandy soil and that the highest concentrations of petroleum hydrocarbons in the 12 Geoprobe borings soil samples were located beyond the utility line trenches. Although ASE concluded that the utility line trenches did not provide a groundwater movement pathway, the ACEHS requested that water samples be collected from the sewer in one of the trenches to assess whether petroleum hydrocarbon-impacted groundwater may have entered the sewer line through seams or cracks.

In January 2004, ASE drilled four additional soil borings, BH-M through BH-P and the soil samples collected from each boring contained concentrations of TPH-d, with the highest concentration of 68 mg/Kg detected in BH-M. No TPH-d, BTEX or oxygenates were detected in any of the other soil samples. The groundwater samples collected from the borings contained TPH-d concentrations as high as 170  $\mu$ g/L and the groundwater sample collected from boring BH-O also contained 19  $\mu$ g/L MtBE. None of the other groundwater samples contained detectable concentrations of TPH-g, BTEX or oxygenates. Groundwater samples were also collected from the sewer line beneath Central Avenue, both up gradient and down gradient of the Site. Low concentrations of TPH-g were detected in both samples. No BTEX or oxygenates were detected in either of these samples. The source of the TPH-g was not conclusively identified.

In December 2005, ASE conducted a records search at the Alameda City Public Works Agency and the California Department of Water Resources to identify water wells with ½ mile radius of the Site. A total of 25 wells were located within the search radius. The results included three domestic wells, 10 irrigation wells, one industrial well, two cathodic protection wells, four groundwater monitoring wells, and five vapor extraction wells. The nearest well is located more than 1,000 feet east of the Site. The nearest, potentially down gradient, well is located approximately 1,260 feet northwest of the Site. Based on the records search, ASE proposed additional soil and groundwater assessment for the Site.

In April 2006, ASE advanced two additional borings and installed two groundwater monitoring wells. Borings BH-Q, BH-R and monitoring wells MW-4 and MW-5 were installed using a drill rig equipped with an 8-inch hollow-stem auger. Petroleum hydrocarbons were detected by laboratory analysis at a concentration of 11 mg/Kg TPH-d in a soil sample from BH-Q and 1.7 mg/Kg TPH-d in a soil sample from the boring MW-5. The laboratory noted that the hydrocarbons reported as TPH-D in each sample did not exhibit a typical diesel chromatogram pattern. None of the soil samples contained detectable concentrations of TPH-g, BTEX or oxygenates.

Groundwater samples collected from BH-Q and BH-R contained detectable concentrations of petroleum hydrocarbon of 220  $\mu$ g/L TPH-d and 770  $\mu$ g/L TPH-d, respectively. Similar to the soil samples, the laboratory noted the hydrocarbons reported as TPH-d did not exhibit a typical diesel chromatogram pattern. Based on the results of this investigation, ASE recommended no further delineation of the extent of petroleum hydrocarbons in soil or groundwater.

From April 2006 to March 2009, groundwater monitoring well samples have been collected and analyzed on a quarterly basis. The monitoring schedule for the Site has been reduced to a semiannual basis as directed in a letter from the ACEHS dated, July 24, 2009. Groundwater monitoring takes place during the first and third quarters.

In June 2008, the Site owners contracted with Matriks to conduct groundwater monitoring and prepare for further Site remediation.

Matriks submitted the *Site Investigation Workplan*, dated September 16, 2009, to the ACEHS. The workplan was prepared in accordance with an ACEHS directive issued in a letter dated

August 13, 2009. The proposed scope of work included the installation of four soil borings to further investigate the vertical extent of the release, define the contaminate plume, and evaluate on and off-site risks.

The ACEHS approved the *Site Investigation Workplan* (Workplan), with modifications to the proposed scope of work, in a letter date October 22, 2009. Four borings were pushed in the vicinity of the existing tanks to a maximum depth of 20 fbg. Free product was observed in several of the borings with TPH-d in groundwater at concentrations up to 1,100,000  $\mu$ g/L. Matriks prepared a *Site Investigation Report*, dated December 15, 2010, documenting the findings. In their *Second 5-Year Review Summary Report* dated July 5, 2011, the State Water Resources Control Board recommended site closure. This report is submitted to justify closure as a low risk site.

## **SCOPE OF WORK**

The following tasks were completed for this groundwater monitoring event:

- Measurement of static water levels in five groundwater monitoring wells;
- Collection of field water quality parameters including pH, temperature, and specific conductance (SC) from groundwater in each well;
- Purging at least three casing volumes from each well;
- Collection and analysis of groundwater water samples from each well for THP-d, TPH-g, BTEX and MtBE (see the *Monitoring Well Purging and Sampling* section of this report for analytical methods used);
- Update of the Geotracker database; and
- Preparation of this *Groundwater Monitoring Report*.

## **METHODS AND PROCEDURES**

#### Groundwater Level Measurements

Prior to measuring the depth to groundwater, the cap of each well was removed and the water level was given an opportunity to equilibrate with atmospheric pressure for approximately 30 minutes before recording measurements using an electronic water depth indicator. The static water levels were referenced to the surveyed marks notched into the top of each well casing and the depth-to-water measurements were used to calculate the purge volume of for each monitoring well.

## Monitoring Well Purging and Sampling

At least three well volumes were purged from each well using a new disposable bailer. Groundwater temperature, pH, and SC were measured intermittently during purging. Measurements were obtained with a Hanna multi-meter, which was calibrated by the equipment rental service prior to on-site use. Water quality measurements were recorded on monitoring well sampling logs, copies of which are included in **Appendix A**. Well purge water was placed into labeled and sealed 55-gallon, DOT-approved steel drums and temporarily stored on-site.

A new disposable bailer dedicated to each well, was used to remove the groundwater samples and transfer them to the appropriate laboratory prepared containers. Care was taken to remove the headspace in each container. Each sample container was labeled with the project number, sample ID, and collection date. The same information was recorded on the laboratory chain-ofcustody form. Samples were stored in a cooler filled with ice for transport to the laboratory.

Samples were transported and submitted to McCampbell Analytical, Inc. of Pittsburg, California (DHS ELAP Certification No. 1644) and analyzed for TPH-g and TPH-d by EPA Method 8015 modified; and for BTEX and MtBE by EPA Method 8021B.

## RESULTS

### Groundwater Levels and Gradient

Depth to water was measured in each monitoring well. The groundwater flow direction, as determined from wells MW-2, MW-3 and MW-5, for this monitoring event was calculated to be northwest with a gradient of 0.009. Well construction details are summarized in **Table 1**. The depth to groundwater and the corresponding water table elevations are summarized in **Table 2**. Groundwater elevation contours are depicted on **Figure 3**. Hydrographs for all monitoring wells are presented on **Figure 4**.

#### Groundwater Analytical Results

TPH-g was detected in wells MW-1, MW-3, and MW-5 at concentrations of 1,500, 6,900 and  $250 \mu g/L$ , respectively. TPH-g was not detected in the remaining monitoring wells.

TPH-d was detected in MW-1, MW-3 and MW-5 at 1,300, 2,500 and 61  $\mu$ g/L, respectively. TPH-d was not detected in the remaining monitoring wells.

Benzene was detected in MW-1, MW-, and MW-5 at 2.5, 84 and 2.2  $\mu$ g/L, respectively. Benzene was not the remaining monitoring wells.

MtBE was detected in MW-5 at 250  $\mu$ g/L. MtBE was not detected in the remaining monitoring wells.

In general, hydrocarbon concentrations decreased in MW-1 and increased slightly in MW-3 and MW-5, when compared to the last time these wells were sampled on December 15, 2011.

Groundwater analytical results for the first quarter 2012 are summarized in **Table 3** and all of the historical groundwater monitoring results are summarized in **Table 4**. A copy of the laboratory analytical report is included in **Appendix B**.

**Figure 5** shows TPH-g and benzene concentration trends in well MW-1 and **Figure 6** shows these same concentration trends in MW-3.

#### Geotracker Requirements

All analytical data were submitted electronically to the California State Water Resources Control Board Geotracker database as required by AB2886 (Water Code Section 13195-13198). EDFs are prepared and formatted by the laboratory and submitted by Matriks. Well latitudes, longitudes (GEO\_XY files), and elevations (GEO\_Z files) were previously submitted to the database. A well status and usage report (GEO\_WELL file) is submitted for each monitoring event. A complete electronic copy of this report (GEO\_REPORT file) in PDF format was also submitted. Updated maps (GEO\_MAP files) are submitted when site features such as monitoring wells or soil borings are added.

## CONCLUSIONS

The site investigation performed in November 2010 indicated free product was present and elevated concentrations of diesel and gas were observed in soil and groundwater samples from several borings. Diesel product has only been dispensed since the new USTs were installed in 1996. The diesel UST was emptied and has not held fuel since 2006. Existing diesel lines were drained back to the tank, all diesel nozzles have been removed from the dispensers and the diesel turbine has been locked out at the electrical box. Free product was not observed in any of the wells during this sampling event.

As shown on **Figures 5 and 6**, the overall trend of TPH-d concentrations is downward in MW-1 and MW-3. **Table 4** indicates that the TPH-d concentration trend is downward in MW-2, MW-4 and MW-5. TPH-g shows a decreasing trend in all monitoring wells this sampling event except in MW-3 which increased slightly from 6,800 to 6,900  $\mu$ g/L, when compared to the last sampling event. Likewise, benzene either was not detected or decreased in concentration in all wells except MW-3 where it increased from 58 to 84  $\mu$ g/L when compared to the last sampling event. Total xylenes also increased slightly in MW-3 from 12 to 15  $\mu$ g/L. The MtBE concentration in MW-5 increased slightly from 220 to 250  $\mu$ g/L, when compared to the last sampling event.

In general, MtBE concentrations are decreasing with time in all wells. MW-1 and MW-3 are above ESLs for TPH-g, TPH-d and benzene. MW-5 is above ESLs for TPH-g, benzene and MtBE.

The detection of hydrocarbons in MW-5 indicates that petroleum hydrocarbons are migrating down gradient from the Site.

## RECOMMENDATIONS

The Site meets all of the requirements for low risk closure as follows:

- 1. The unauthorized release is located within the service area of a public water system;
- 2. The unauthorized release consists only of petroleum;
- 3. The unauthorized release has been stopped;
- 4. Free product has been removed to the maximum extent practicable;
- 5. A conceptual site model has been developed;
- 6. Secondary source removal has been addressed;
- 7. Soil and groundwater has been tested for MtBE and results reported in accordance with H&S Code Section 25296.15; and
- 8. Nuisance as defined by Water Code Section 13050 does not exist at the Site.

Based on these criteria, we recommend this site for low risk case closure. The SWRCB concurred with this recommendation in their *Second 5-Year Review Summary Report* dated July 5, 2011. This report is provided in **Appendix C**. With the concurrence of ACEH, CES will prepare a formal Request for No Further Action pursuant to Appendix A of the *Tri-Regional Recommendations for Preliminary Investigation and Evaluation of Underground Storage Tank Sites*.

WQO				1.0	150	700	1750	5

Notes:

Units are micrograms per liter (ug/L).

TPH-g total petroleum hydrocarbons as gasoline

TPH-d total petroleum hydrocarbons as diesel

a Laboratory noted that weakly modified or unmodified gasoline is significant

b Aquaeous sample contains greater than 1% by volume sediment

+ Laboratory noted that diesel range compounds are significant; no recognizable pattern

^ Laboratory noted that gasoline range compounds are significant

<sup>+</sup> Laboratory noted that oil range compounds are significant

ESL Environmental Screening Limits

WQO Water Quality Objectives for Site: Per the Region 2, Water Quality Control Plan

# **Analytical Report**

Cook Environmental Services, Inc.	Client Project ID: #1035; Alameda Gas	Date Sampled: 03/29/12
1485 Treat Blvd, Ste. 203A		Date Received: 03/29/12
1100 IIcu Diva, Ste. 20011	Client Contact: Tim Cook	Date Reported: 04/04/12
Walnut Creek, CA 94597	Client P.O.:	Date Completed: 04/04/12

#### WorkOrder: 1203A02

April 04, 2012

Dear Tim:

Enclosed within are:

- 1) The results of the **5** analyzed samples from your project: **#1035; Alameda Gas,**
- 2) QC data for the above samples, and
- 3) A copy of the chain of custody.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius Laboratory Manager McCampbell Analytical, Inc.

The analytical results relate only to the items tested.

#### SECOND 5-YEAR REVIEW SUMMARY REPORT FOR CLAIM NUMBER 12650; ALASKA GASOLINE, LOCATED AT 1310 CENTRAL AVENUE, ALAMEDA, CA

The UST Cleanup Fund (Fund) has completed our review of Alameda County Environmental Health (Alameda County) Case No. RO0000022. The 5-Year Review Summary Report for this case is enclosed for your information and comment. Please note that the Fund's recommendations are based on review of information contained in the Fund's case files, data currently in the GeoTracker database and any other sources of information that were readily available to Fund staff at the time the review was conducted. Consequently, they may not reflect historical information that has not been uploaded to the GeoTracker database or available in the Fund's case files and any data that has been recently submitted to your office.

The Fund requests that Alameda County staff notify the Fund within 45 days from the date of this letter as to whether you agree or disagree with our recommendations for this case. If you agree with our recommendation, we request that you provide the Fund with an estimated timeframe to either implement the recommendations for additional corrective action or for closing this case. If you do not agree with our recommendations, we request that you provide the Fund with a summary of the reasons for disagreeing and/or impediments to implementing the recommendations for additional corrective action or closing this case. Responses to the Fund may be provided by e-mail, letter or a copy of correspondence to the RP, if the correspondence addresses all the information requested by the Fund. Please direct your response to:

Pat G. Cullen, P.G. Underground Storage Tank Cleanup Fund State Water Resources Control Board P.O. Box 944212 Sacramento, CA 94244-2120 (PCullen@waterboards.ca.gov)

Fund staff will be sending copies of the completed 5-Year Review Summary Report to applicable claimants 45 days from the date of this letter unless Alameda County notifies the Fund that they wish to discuss this case prior to transmittal to the claimant. If you or your staff has any questions or concerns on specific reports that you would like to discuss with the Fund prior to transmittal of the report to the claimant, please contact Pat G. Cullen at (916) 341-5735 or by email (PCullen@waterboards.ca.gov) within this period.

Sincerely,

#### Signed by Pat G. Cullen for

Robert Trommer Senior Engineering Geologist Chief, Technical Review Unit Underground Storage Tank Cleanup Fund

6	Unknown	Gasoline	Active	2009

#### II. RELEASE INFORMATION

- Source of Release: USTs
- Date Release Reported: 1 February 1995
- Affected Media: soil and groundwater

#### **III. SITE CHARACTERIZATION INFORMATION**

#### A. Site Information

SITE DESCRIPTION: The Site is currently an active retail gasoline station located in a mixed commercial and residential area in the south-central portion of the island of Alameda.

GW BASIN: East Bay Plain Groundwater Basin

CURRENT LAND USE: Undesignated

BENEFICIAL USES: Municipal and domestic supply, other groundwater (uses other than drinking water)

DISTANCE TO NEAREST SUPPLY WELL: According to the California Department of Public Health (DPH) database, no wells identified within ½ mile of the site. According to the Alameda City Public works Agency records a total of 14 wells were identified within a ½ mile radius of the

Site; three domestic wells, 10 irrigation wells and one industrial well. The nearest down gradient well is located 1,260 feet northwest of the Site.

-2-

MINIMUM GROUNDWATER DEPTH: 1.93 feet below ground surface (bgs) in Site well MW-3.
MAXIMUM GROUNDWATER DEPTH: 6.59 feet bgs in Site well MW-1
FLOW DIRECTION: Northwest
SOIL TYPES: Sands and silty sands
MAXIMUM DEPTH SAMPLED: 17.5 feet bgs.

#### B. Monitoring Well Information

Well Designation	Date Installed	Screen Interval	Depth To Water
		(feet bgs)	(January 2011)
MW-1	October 1999	2.5-17.5	3.61
MW-2	October 1999	4-18	4.17
MW-3	October 1999	4-19	2.58**
MW-4	April 2006	5-15	2.19**
MW-5	April 2006	5-15	2.69**

NM - Not measured

\* - Numerous occasions when groundwater elevation measured in the well was above the screened interval

\*\* - Groundwater elevation measured in well higher than the screen this quarter

#### IV. MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS

Contaminant	Soil (m	ng/kg)	Water	r (µg/L)	WQOs	
	Maximum	Latest (December 2010)	Maximum	Latest (January 2011)	(µg/L)

Benzene	31	54	1,300	100	1	
Toluene	250	630	59	20	150	
Ethylbenzene	120	520	740	20	700	
Xylenes	680	3,400	1,600	42	1,750	
MTBE	< 0.02	<2.0	120,000	450	5	
TBA	NA	<2.0	100	100	1,200***	

NA Not Analyzed, Not Applicable or Data Not Available

WQO WATER QUALITY OBJECTIVES: Per the Region 2, Water Quality Control Plan (Basin Plan).

ND – Laboratory results reported below detection limits

\* - The laboratory noted the diesel chromatograms were not consistent with typical diesel

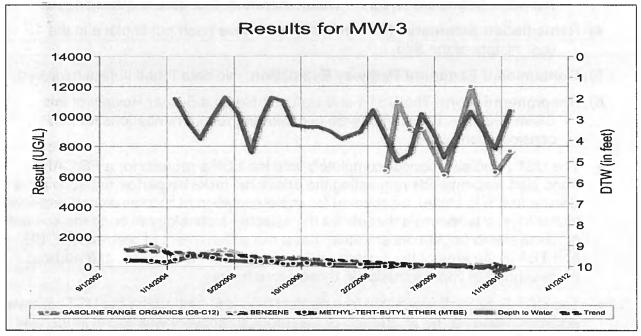

\*\* - The Laboratory notes that; weakly modified gasoline is significant; diesel range compounds are significant; no recognizable pattern; heavier range compounds are significant.

- \*\*\* California Department of Public Health, Response Level
- V. FREE PRODUCT: Free-product was observed during the UST removal process in 1996.

## VI. SOIL AND GROUNDWATER REMEDIATION

- **A. Soil Excavation:** Approximately 600 cubic yards of impacted soil was removed from the Site during the UST removal activities in 1996
- B. In-Situ Soil: None to date
- C. Groundwater Remediation:

**D. Groundwater Trends**: The graph below presents the historic concentrations of TPHg, benzene and MTBE plotted against groundwater elevations for Site well MW-3. As presented in the graph below the concentrations of benzene and MTBE are naturally degrading and the concentrations of TPHg are stable.

## E. SENSITIVE RECEPTOR SURVEY:

Surface water – San Francisco Bay and Alameda Estuary are both located approximately ½ mile south of the Site.

## VIII. COMMENTS AND JUSTIFICATION FOR RECOMMENDED ACTION

1) Site Description: The Site is currently an active retail gasoline station located in a mixed commercial and residential area in the south-central portion of the island of Alameda.

May 1996 – Approximately 15,000 gallon of TPH affected groundwater was removed during the UST removal activities.

#### 2) Site History:

May 1996 – UST removal activities resulted in the discovery of an unauthorized release.

November 1998 through Current - Site assessment and monitoring activities were conducted.

- 4<sup>th</sup> Qtr 2009 A work plan was approved to provide further definition. In addition to approving the work plan the LOP requested additional information including: a feasibility study/corrective action plan, provided a schedule of requested reports, and reminded the claimant of the GeoTracker reporting requirements.
- 3) Groundwater Monitoring Summary: The Site has been monitored for 13 years. The regular groundwater monitoring reports do not present adequate data to define the limits of petroleum hydrocarbon contamination that has migrated northwest, off-Site. In addition, numerous water level measurements and sampling events have been conducted in wells where the well screens are under water, therefore, that data is questionable.
- Remediation Summary: No remedial efforts have been put in place in the 15 year history of the Site.
- 5) **Contaminant Exposure Pathway Evaluation**: No data found in files reviewed
- 6) **Recommendation:** The UST Fund staff completed a 5-Year Review of this Claim in 2010. The staff offered the following recommendations for LOP consideration.
- The UST Fund staff concur completely with the LOP's request for a FS/CAP. Fund staff recommends requesting the additional tasks be performed such as; a Conceptual Site Model, a schedule for implementation of recommended remedial technology, a proposed schedule for the selected technology to bring the soil and groundwater to target concentration, basic risk assessment of benzene, MTBE, and TBA in the area of the residential properties north of the Site, and address the likelihood of vapor intrusion in those same homes.
- The UST Fund staff noted that free product was reported during the UST removal activities, however, no discussion of free product recovery was found in the files reviewed.
- The UST Fund staff questions the rational for further vertical definition of the lighter than water contaminates at a site. No mechanism for vertical movement has been identified at the Site to warrant the additional investigation and cost.
- The UST Fund staff noted that four of the five Site groundwater monitoring wells have screened intervals that have historically been submerged when sampled. Those data represent questionable data. Two wells have never had a valid sample collected in the history of the wells (MW-4 and MW-5).

**California Environmental Protection Agency** 

Recycled Paper

 The UST Fund staff also recommends the Claimant upload historic groundwater water levels and analytical data into GeoTracker, at a minimum, to the date it was required to be uploaded in 2005.

A Second 5-Year Review has been completed for this Site and the UST Fund staff offer these recommendations for LOP consideration. The UST Fund staff recommends the Site be considered for Low Risk Closure for the following reasons:

- The residual concentrations are stable and reducing as presented in the graph above and figure attached;
- The Site may be reopened if the land use is changed in the future, at which time the residual petroleum hydrocarbons in the subsurface can be addressed, if they have not naturally degraded; and
- The risks to the environment and humans are minimized due to the natural degradation that is occurring and the lack of the use of shallow groundwater in the immediate area.
