Re: **Fuel System Upgrade Soil Sampling, Soil Excavation, and Geophysical Survey Report**
Shell-branded Service Station
5755 Broadway
Oakland, California
SAP Code 135699
ACHCSA Case # RO-0026
Cambria Project #206-0483-001

Dear Mr. Matthews:

On behalf of Equilon Enterprises LLC dba Shell Oil Products US (Shell), Cambria Environmental Technology, Inc. (Cambria) has prepared this *Fuel System Upgrade Soil Sampling, Soil Excavation, and Geophysical Survey Report* to document underground storage tank (UST) replacement and sampling, dispenser and piping replacement and sampling, over-excavation sampling, and geophysical survey activities conducted between November 2004 and June 2005 at the referenced site. The work was performed to comply with Oakland Fire Department (OFD) and Alameda County Health Care Services Agency (ACHCSA) guidelines.

SITE DESCRIPTION

The site is an active Shell service station located at the northern corner of the Taft Street and Broadway intersection in Oakland, California (Figures 1 and 2). Mixed commercial and residential properties surround the site. The site layout includes a station building, three 10,000-gallon gasoline USTs, and four dispenser islands.

**Cambria

UST REMOVAL AND UST EXCAVATION SOIL AND GROUNDWATER SAMPLING

Fillner Construction, Inc. (Fillner) of Rocklin, California initiated fuel system upgrades at the site during November 2004 by. On November 19, 2004, a water line was apparently damaged during the construction activities. On November 20, 2004, station personnel observed that water leaking from the broken line had entered the tank backfill and caused the uncovered tanks to float in the tank excavation. Cambria and Shell personnel responded at the site and secured the tanks. Piping had been previously disconnected from the tanks. Cambria observed a small amount of fuel dripping from one of the tank sumps. Shell estimates that less than 0.1 gallon of fuel was lost. Fillner used a bucket to contain the fuel until the sump was repaired. Absorbent cloths were used to remove fuel from within the tank backfill. Shell filed an Underground Storage Tank Unauthorized Release (Leak)/Contamination Site Report dated November 22, 2004 with the OFD and the Regional Water Quality Control Board (Attachment A).

On December 17, 2004, Fillner coordinated and directed the removal of three 10,000-gallon double-walled fiberglass gasoline USTs and, at Shell's request, tank backfill wells T-1 and T-2. Attachment B presents Cambria's standard procedures for tank, piping, and dispenser removal sampling.

Personnel Present:

- Keith Matthews, Hazardous Materials Inspector, OFD
- Scott Brown, Site Foreman, Fillner
- Dan Lescure, Senior Project Engineer, Cambria (November 20, 2004 only)
- Martin Wills, Project Geologist, Cambria

Observation and Sampling Dates: November 20 and December 17, 2004, and January 31, February 1, and February 9, 2005.

UST Removal Observations: Cambria personnel did not observe any holes, cracks, or failures in the USTs.

UST Excavation Groundwater Sampling: On December 17, 2004, at OFD inspector Keith Matthews' direction, Cambria collected one groundwater sample (TP-GW-1) from the UST excavation. The sample was collected using a disposable bailer and transferred into vials containing hydrochloric acid preservative with no headspace. The groundwater sample was labeled, placed into a cooler with ice, entered into a chain of custody record, and transported to a California-certified analytical laboratory.

UST Excavation Soil Sampling: On January 31, 2005, Keith Matthews directed Cambria to collect soil samples from the northwestern, northern, and eastern UST excavation sidewalls at the soil-water interface, in the approximate locations of the former USTs. Four samples (TP-1-14, TP-2-14, TP-3-14, and TP-4-14) were collected at a depth of approximately 14 feet below grade (fbg). On February 9, 2005, Cambria collected soil samples from the southeastern, southern, and southwestern UST excavation sidewalls at the soil-water interface, in the approximate locations of the former USTs. Four samples (TP-5-14, TP-6-14, TP-7-14, and TP-8-14) were collected at a depth of approximately 14 fbg (Figure 2). Keith Matthews was not available to observe sampling activities on this day, but pre-approved Cambria's sample locations. Soil samples were collected using an extended-arm excavator. The soil was removed from the excavator bucket, packed into clean brass sample tubes, and tube ends were covered with Teflon tape and plastic end caps. Soil samples were labeled, placed into a cooler with ice, entered into a chain of custody record, and transported to a California-certified analytical laboratory.

Additional Excavation and Sampling: Following UST excavation sampling on January 31, 2005, Fillner exposed hydrocarbon-impacted material along the northeastern UST excavation sidewall at approximately 10 fbg, while enlarging the UST excavation to the northeast to accommodate wider USTs.

On February 1, 2005, Cambria collected two four-point composite samples (SP-5 and SP-6) from the hydrocarbon-impacted area of the northeastern UST excavation sidewall at approximately 5 and 10 fbg. Cambria collected the samples directly from Fillner's backhoe bucket, in the manner previously described. Based on the soil type, the impacted material appears to be non-native fill. These samples were subsequently used to profile soil for disposal.

Chemical Analyses: The groundwater sample and excavation sidewall soil samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and total xylenes (BTEX), and fuel oxygenates (methyl tert-butyl ether [MTBE], di-isopropyl ether [DIPE], ethyl tert-butyl ether [ETBE], tert-amyl methyl ether [TAME], and tert-butyl alcohol [TBA]) by EPA Method 8260B by State-certified Kiff Analytical, LLC of Davis, California or Severn Trent Laboratories, Inc. (STL) of Pleasanton, California. Soil composite samples SP-5 and SP-6 were analyzed for hexane extractable material (oil and grease) by EPA Method 1664A M, for total petroleum hydrocarbons as diesel (TPHd) by EPA Method 8015M, for TPHg and BTEX by EPA Method 8260B, and for total lead by EPA Method 6010B.

CONFERENCE CALL

On February 4, 2005, Cambria held a conference call with representatives from Shell, Fillner and OFD, and summarized the discussion in our February 9, 2005 *Underground Storage Tank Replacement and Over-Excavation Activities*. In this letter, Cambria proposed investigating and remediating the impacted soil encountered along the northeastern UST sidewall. Cambria proposed conducting over-excavation after the new USTs were set and the tank excavation was partially backfilled. This work was not implemented, per subsequent discussions with Fillner and Keith Matthews, due to the risk of undermining the adjacent UST excavation's structural integrity. Cambria also proposed using a metal detector to investigate the possibility that an abandoned tank is located in the vicinity of the impacted soil. Results of the geophysical survey performed by NORCAL Geophysical Consultants, Inc. (NORCAL) of Petaluma, California are summarized below.

GEOPHYSICAL SURVEY

Personnel Present:

- Scott Brown, Site Foreman, Fillner
- David Bissiri, Geophysicist, NORCAL
- Martin Wills, Project Geologist, Cambria

Survey Date: February 17, 2005

Survey Activities and Results: Cambria directed NORCAL to conduct a shallow subsurface geophysical investigation in the area along the northeastern UST excavation boundary (Figure 2). The investigation's purpose was to identify any detectable subsurface objects that could be a source for the hydrocarbon-impacted material observed on the northeastern UST excavation sidewall.

NORCAL used electromagnetic line locating/metal detection to detect shallowly buried metal objects such as utilities, drums, or USTs. NORCAL used ground-penetrating radar to image variations in the electrical properties of the shallow subsurface, which can provide information regarding the location of utilities and the dimensions of buried objects such as a UST or sump. Of the four geophysical anomalies the geophysical survey detected, two have features that are consistent with buried objects such as drums or USTs. One anomaly in particular, located approximately 6 to 8 feet northeast of the UST pit, is of a size and shape consistent with a

550-gallon UST. The remaining two anomalies, located in the far northeast corner of the site, were interpreted by NORCAL to be buried debris. NORCAL's geophysical report is presented as Attachment C.

DISPENSER AND PRODUCT PIPING REMOVAL AND SOIL SAMPLING

In November 2004, Fillner removed the four dispensers and associated product piping. Attachment B presents Cambria's standard procedures for tank, piping, and dispenser removal sampling.

Personnel Present:

- Keith Matthews, Hazardous Materials Inspector, OFD
- Scott Brown, Site Foreman, Fillner
- Martin Wills, Project Geologist, Cambria

Sampling Date: February 17, 2005

Dispenser and Product Piping Soil Sampling: Keith Matthews directed Cambria to collect soil samples from beneath the former dispensers (D-1-2, D-2-2, D-3-2, and D-4-2) and former piping (P-1-1, P-2-2 and P-3-2) from native soil at depths between 1 and 2 fbg (Figure 2). Soil samples were collected using a backhoe in the manner previously described.

Chemical Analyses: STL analyzed soil samples for TPHg, BTEX, and fuel oxygenates by EPA Method 8260B, and for total lead by EPA Method 6010B.

DISPENSER AND PRODUCT PIPING OVER-EXCAVATION AND SOIL SAMPLING

On February 24, 2005, at Shell's request, Cambria directed over-excavation activities beneath the former dispensers and product piping.

Personnel Present:

- Keith Matthews, Hazardous Materials Inspector, OFD
- Scott Brown, Site Foreman, Fillner
- Stewart Dalie, Senior Staff Geologist, Cambria

Sampling Date: February 24, 2005

Over-Excavation Sampling: As Cambria directed, Fillner conducted lateral and vertical over-excavation in the dispenser and piping areas. The final extent of over-excavation in this area was approximately 6 feet long by 4 feet wide around each former dispenser, and approximately 5 to 10 feet long by 4 feet wide around each of the former product pipes. The vertical extent of excavation in these areas was between 4 and 6 fbg. The approximate extents of over-excavation are shown on Figure 2. As directed by Keith Matthews of OFD, Cambria collected four confirmation samples (D-1-4', D-2'6', D-3-6', and D-4-4') from beneath the dispenser islands and three confirmation samples (P-1-6', P-2-4' and P-3-6') from beneath the product piping (Figure 2). All confirmation samples were collected at the vertical extent of excavation using a backhoe, in the manner described above.

Chemical Analyses: STL analyzed all over-excavation soil samples for TPHg, BTEX, and fuel oxygenates by EPA Method 8260B, and for total lead by EPA Method 6010B.

SOIL AND GROUNDWATER DISPOSAL

Soil Disposal: Between November 22, 2004 and June 10, 2005, Cambria collected seven four-point composite samples (SP-1, SP-2, SP-3 and SP-5 through SP-8) to characterize soil and pea gravel generated by fuel system upgrade, over-excavation, and surface re-grading activities for disposal. Cambria did not collect a sample by the name of SP-4. Between January 31 and June 15, 2005, Manley and Sons Trucking, Inc. of Sacramento, California transported a total of approximately 1522.48 tons of soil and pea gravel to Allied Waste Industries' Forward Landfill in Manteca, California for disposal as non-hazardous waste. Laboratory reports for soil disposal samples are included in Attachment D. Disposal confirmation documents are presented as Attachment E.

Groundwater Recovery: Since groundwater beneath the site is shallow (approximately 2 to 5 fbg), groundwater was extracted periodically throughout the project to facilitate work in the tank pit area. Philip Services Corporation and Onyx Industrial Services, Inc. provided the vacuum trucks used to transport the extracted groundwater to Shell's Martinez Refinery for recycling. Groundwater was either removed directly from the UST excavation using vacuum trucks, or it was pumped from the UST excavation into aboveground storage tanks for temporary storage pending transport by vacuum trucks. A total of approximately 319,826 gallons of non-hazardous groundwater was removed. Bills of lading documenting the transport of this water are included as Attachment F.

ANALYTICAL RESULTS

Table 1 summarizes soil analytical results, and Attachment D presents the laboratory analytical reports for groundwater and soil samples. A summary of these data is presented below.

UST Excavation Groundwater Sample: Sample TP-GW-1 contained 640 parts per billion (ppb) TPHg, 11 ppb benzene, 38 ppb MTBE, and 8.7 ppb TBA.

UST Excavation Soil Samples: TPHg was detected in three of the UST excavation samples at concentrations ranging from 1.5 parts per million (ppm) in TP-2-14 to 32 ppm in TP-3-14. Benzene was not detected in any of the UST excavation samples. MTBE was detected in TP-3-14 at a concentration of 0.082 ppm.

Additional Excavation Samples: TPHg was detected in SP-5 and SP-6 at concentrations of 560 and 1,500 ppm, respectively. Benzene was not detected above the laboratory reporting limits. TPHd was detected in SP-5 and SP-6 at concentrations of 130 and 100 ppm, respectively. The laboratory reported that the diesel-range hydrocarbons are in the early diesel range and do not match their diesel standard. Lead was detected in SP-5 and SP-6 at concentrations of 4.2 and 8.7 ppm, respectively. Oil and grease was detected in SP-5 and SP-6 at concentrations of 200 and 61 ppm, respectively. Table 1 does not include the results of four-point composite samples used to classify soil for disposal.

Dispenser and Piping Soil Samples: TPHg was detected in all seven dispenser and piping samples at concentrations ranging from 130 ppm in P-2-2 to 1,100 ppm in DS-3-2. Benzene was not detected above laboratory reporting limits in any dispenser and piping soil samples. MTBE was detected in P-3-2 at a concentration of 0.84 ppm. TBA was detected in P-2-2 at a concentration of 4.1 ppm. Lead was detected in all seven dispenser and piping samples at concentrations ranging from 5.9 ppm in P-1-1 to 17 ppm in P-3-2.

Dispenser and Piping Over-Excavation Soil Samples: TPHg was detected in all seven over-excavation soil samples at concentrations ranging from 1.8 ppm in DS-3-6' to 1,000 ppm in DS-2-6'. Benzene was detected in P-1-6' at a concentration of 0.66 ppm. MTBE was detected in five over-excavation samples at concentrations ranging from 0.035 ppm in DS-1-4' to 1.9 ppm in P-1-6'. TBA was detected in three dispenser over-excavation samples at concentrations ranging from 0.060 ppm in DS-1-4' to 0.13 ppm in sample DS-3-6'. Lead was detected in all seven over-excavation soil samples at concentrations ranging from 5.5 ppm in DS-3-6' to 7.3 ppm in P-2-4'.

CONCLUSIONS

Cambria collected a groundwater sample from the UST excavation and soil samples from beneath the former USTs, dispensers, and product piping. Confirmation soil samples were also collected from beneath the former dispensers and product piping following limited over-excavation. The extent of over-excavation was limited by physical constraints at the site, including proximity to an underground water pipe and the canopy footings. The analytical results of the over-excavation samples are comparable to the dispenser and piping compliance sample results.

Lead was detected in the dispenser, piping, and over-excavation samples, at a maximum concentration of 17 ppm. This concentration is below the San Francisco Bay Regional Water Quality Control Board environmental screening level for lead, which is 150 ppm¹ in shallow soil where groundwater is a potential source of drinking water for residential land use restrictions.

Petroleum hydrocarbons and fuel oxygenates were detected in the UST excavation, dispenser, and piping areas. Constituent concentrations from the current activities are comparable to the 1998 dispenser upgrade results, indicating that they do not represent a new release. This site is currently an open environmental case with ACHCSA, and Cambria does not recommend any additional activities based on these soil and groundwater sampling results.

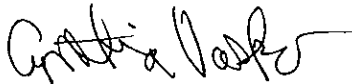

The geophysical survey identified two anomalies that have features consistent with buried objects such as drums or USTs. To determine whether abandoned drums or USTs are present, Cambria recommends using hand-auguring equipment to advance exploratory borings in these two areas. The complete scope of work will be presented in a work plan to ACHCSA under separate cover.

¹ San Francisco Bay Regional Water Quality Control Board's *Screening For Environmental Concerns at Sites With Contaminated Soil and Groundwater* (Interim Final – February 2005).

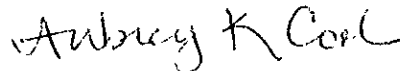

CLOSING

If you have any questions regarding the contents of this report, please call Cynthia Vasko at (510) 420-3344.

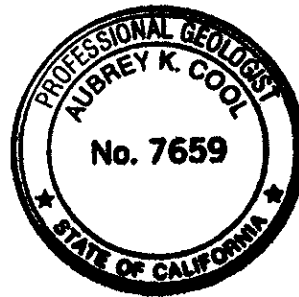

Sincerely,
Cambria Environmental Technology, Inc.

COMMENTS: USTs floated due to a broken water line. Fuel loss not observed upon discovery. Small drip from sump piping observed later. Cap on piping was tightened to stop drip. Captured ~1 gallon of fuel in bucket before dripped was stopped. An estimated 10 to 50 ml of fuel was discharged to water within tank pit. This fuel was removed using absorbant cloths. This site is an existing LOP case.

**Standard Tank, Piping and Dispenser
Removal Sampling Procedures**

TANK REMOVAL SAMPLING PROCEDURES

This document describes Cambria Environmental Technology's standard operating procedures for collecting soil and ground water samples during underground storage tank removal. These procedures ensure that the samples are collected, handled, and documented in compliance with California Administration Code Title 23: Waters; Chapter 3: Water Resources Control Board; Subchapter 16: Underground Storage Tank Regulations (Title 23). Cambria's sampling procedures are based on guidelines contained in the California State Regional Water Quality Control Board Tri-Regional Staff Recommendations for Preliminary Evaluation and Investigation of Underground Tank Sites dated August 10, 1990.

Tank Removal Sampling

The objective of sample collection during routine underground storage tank removals is to determine whether hydrocarbons or other stored chemicals have leaked to the subsurface. If no ground water is encountered within the tank excavation, Cambria will sample native soil 1 to 2 ft beneath the removed tank. Additional soil samples may also be collected at locations of obvious spillage to determine maximum concentrations in the surrounding soils. For underground storage tanks with a capacity of less than 1,000 gallons, one soil sample is collected beneath the fill end of the tank. For tanks with a capacity of between 1,000 and 10,000 gallons, one soil sample is collected beneath each end of the tank. For tanks larger than 10,000 gallons, 3 or more soil samples are collected beneath the removed tank. We also collect one soil sample for every 20 ft of product piping.

In cases where ground water is encountered within underground storage tank excavations, Cambria will collect confirmatory soil samples from the excavation sidewalls just above the soil/ground water interface and a representative ground water sample from the excavation. The excavation is typically purged and allowed to recover prior to collecting the water sample. For tanks with capacities of 10,000 gallons or less, one soil sample is collected from the wall at each end of the tank excavation. For tanks with capacities greater than 10,000 gallons, or tank clusters, at least four soil samples are collected from the excavation walls next to the tank ends. Piping samples are collected in native soil 1 to 2 ft beneath the removed piping. One sample is typically collected for every 20 linear ft of piping unless regulatory agencies approve of different sampling requirements.

The soil samples are collected in steam cleaned brass or steel tubes from either a driven split-spoon type sampler or the bucket of a backhoe. When a backhoe is used, approximately three inches of soil are scraped from the surface and the tube is driven into the exposed soil.

Upon removal from the split-spoon sampler or the backhoe, the samples are trimmed flush, capped with Teflon sheets and plastic end caps, labeled, logged and refrigerated for delivery under chain of custody to a State certified analytic laboratory.

The ground water sample is collected using steam cleaned Teflon or PVC bailers, decanted into a volatile organic analysis (VOA) bottle or other appropriate clean sample container, refrigerated and transported under chain of custody to a State certified analytic laboratory.

CAMBRIA

STANDARD PIPING AND DISPENSER REMOVAL SAMPLING PROCEDURES

Cambria Environmental Technology, Inc. (Cambria) has developed standard operating procedures for collecting soil samples during petroleum dispenser and piping removal. These procedures ensure that the samples are collected, handled, and documented in compliance with California Administration Code Title 23: Waters; Chapter 3: Water Resources Control Board; Subchapter 16: Underground Storage Tank Regulations (Title 23). Cambria's sampling procedures are based on guidelines contained in the California State Regional Water Quality Control Board Tri-Regional Staff Recommendations for Preliminary Evaluation and Investigation of Underground Tank Sites dated August 10, 1990.

Piping and Dispenser Removal Sampling

The objective of sample collection during routine dispenser and piping removals is to determine whether hydrocarbons or other stored chemicals have leaked to the subsurface. We collect one soil sample from the native soil beneath each dispenser unit, at each piping elbow, and at every 20 ft of product piping, as applicable.

The soil samples are collected in steam cleaned brass or steel tubes from either a driven split-spoon type sampler or the bucket of a backhoe. When a backhoe is used, approximately three inches of soil are scraped from the surface and the tube is driven into the exposed soil.

Upon removal from the split-spoon sampler or the backhoe, the samples are trimmed flush, capped with Teflon sheets and plastic end caps, labeled, logged and refrigerated for delivery under chain of custody to a State certified analytic laboratory.

Subject: Geophysical Survey
Shell Service Station
5755 Broadway, Oakland, California
NORCAL Job No. 05-462.20

Dear Mr. Wills:

This letter presents the findings of a geophysical investigation performed by NORCAL Geophysical Consultants, Inc. on a portion of the subject property. The field survey was conducted on February 17, 2005 by NORCAL Geophysicist David Bissiri. Logistical support and background information was provided by Martin Wills of Cambria Environmental Technology.

I SITE DESCRIPTION AND PURPOSE

The investigation area, as specified by Cambria, encompasses an approximately 50-by-45-foot triangular portion of the service station lot (see Plate 1). At the time of this investigation the site was temporarily closed for remodeling. Part of the remodeling included the installation of new underground storage tanks (USTs), the placement of which was only partially completed. A new tank excavation that was partially filled with gravel is located west of the existing pump island canopy. The excavation is surrounded by concrete pavement that appears to have been poured at different times over the history of the site. Additional site features in or near the investigation area include: a concrete-block retaining wall located along the western property line, a planter located along the foot of the retaining wall, a combined compressed air/water cabinet and a soil pile near the northern corner of the investigation area, and a portable toilet and four dismantled pump cabinets located near the retaining wall.

According to information supplied by Cambria, the site has previously undergone remodeling at least once before the current upgrade. However, the records are incomplete as to where the original USTs (the ones predating those removed for the current remodeling) were located. It is believed that all previous USTs associated with the dispensing of fuel have been removed, but it is unknown if other USTs, such as abandoned waste oil tanks, are present. The possibility of abandoned USTs remaining on-site was raised because the presence of an oily substance that was detected in the soil at the northern end of the new UST excavation during the current remodeling activities. The purpose of this geophysical investigation, therefore, was to obtain subsurface information to aid in defining the locations of any detectable subsurface objects within the investigation area that could be the source of the oily substance.

II METHODOLOGY

We used the electromagnetic line locating/metal detection (EMLL) and ground penetrating radar (GPR) methods to conduct the investigation. The EMLL method was used to detect shallowly buried metal objects that may represent utilities or other subsurface objects that could be associated with USTs. The GPR method was used to image variations in the electrical properties of the shallow subsurface. These variations can provide information regarding the location of utilities and the dimensions of buried objects such as a UST or sump. Descriptions of the EMLL and GPR methods are provided in Appendix A.

III FIELD INVESTIGATION

Prior to proceeding with the geophysical data acquisition, we established a horizontal control survey grid using a fiberglass measuring tape. The survey grid was based on a rectangular coordinate system. The limits of this grid (survey area) are shown on Plate 1.

We scanned the investigation area with the EMLL equipment along both north-south and east-west trending traverses spaced approximately three feet apart. We then used the GPR to acquire data profiles along north-south traverses spaced two feet apart. The GPR records were examined for reflection patterns characteristic of USTs, drums, sumps, and buried utilities. The alignments and outlines of interpreted subsurface objects were then marked on the pavement with spray paint.

IV RESULTS

The results of the geophysical investigation are presented on the Site Map, Plate 1. This map shows the limits of the geophysical investigation, the locations of pertinent above ground features, and the locations of detected subsurface features.

The GPR results were limited by the presence of the reinforcing in the pavement, but our evaluation of the GPR data profiles did define four localized GPR anomalies within the investigation area. These anomalies are depicted on Plate 1 as the shaded blue rectangles. The two GPR anomalies located in the southern portion of the investigation area and labeled I and II may be due to subsurface objects such as drums or small USTs. What suggests this are three things: 1) their GPR reflections are similar to those typically associated with drums or USTs; 2) they are located in the proximity where the oily substance was encountered; and 3) both anomalies are located within a portion of the concrete pavement that appears to be newer than that of the surrounding concrete. Based on these facts and the apparent dimensions of the detected features, we believe it is possible that these two anomalies may be due to buried objects such as drums or, in the case of Anomaly I, a 550-gallon

Cambria Environmental Technology
March 7, 2005
Page 3

UST. The remaining two GPR anomalies are located in the northeastern portion of the investigation area. Based on their GPR reflections, we interpret these anomalies to be buried debris.

The EMLL results were also limited by the apparent existence of steel reinforcing within the concrete pavement. However, the EMLL was able to delineate two suspected undifferentiated utility alignments and these are depicted on Plate 1 as the dashed black lines labeled "-uu-". One of the alignments extends southward from the air/water cabinet and may represent the electric or water service lines associated with the cabinet. The other utility appears to a relatively short section of a utility conduit extending westward from underneath the northeast corner of the pump island cavity. We interpret this feature to be an abandoned utility line.

V LIMITATIONS

The geophysical methods used for this investigation have limitations that may preclude the clear and accurate definition of certain subsurface features. The most notable limitations are:

- The object of interest may be buried deeper than the detection capabilities of the geophysical method.
- There may be a lack of contrast in physical properties between native soils and buried objects.
- Above or below ground cultural features such as utilities, fences, reinforcing, and debris may cause interference that limits or masks the detection of nearby a buried object.
- Different objects can produce similar results, especially with GPR. Objects having similar dimensions, construction material, and similar depths of burial often cannot be distinguished from each other, i.e a corrugated steel storm drain may appear like a UST, and vice-versa.

Since the accuracy of our findings is subject to these limitations, it should be noted that not all buried objects or features may be detected or characterized by the geophysical techniques used for this investigation. A more detailed discussion of the limitations with regard to each of the geophysical methods used for this investigation is presented in Appendix A.

VI STANDARD CARE AND WARRANTY

The scope of NORCAL's services for this project consisted of using geophysical methods to characterize the shallow subsurface. The accuracy of our findings is subject to specific site conditions and limitations inherent to the techniques used. We performed our services in a manner consistent with the level of skill ordinarily exercised by members of the profession currently employing similar methods. No warranty, with respect to the performance of services or products delivered under this agreement, expressed or implied, is made by NORCAL.

We appreciate having the opportunity to provide you with this information.

Respectfully,

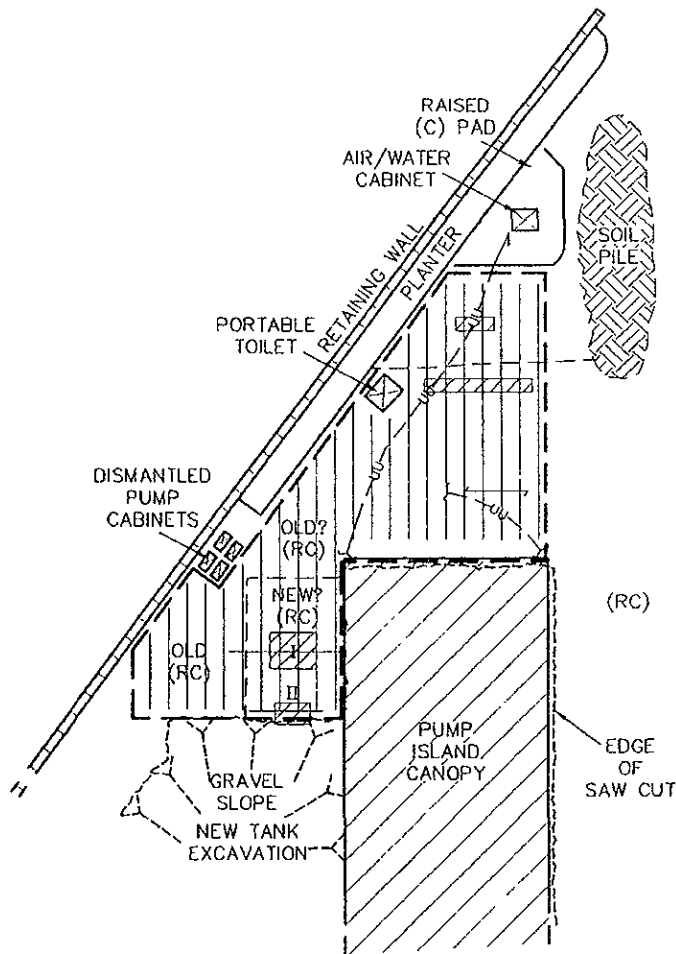

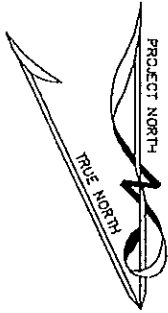

NORCAL Geophysical Consultants, Inc.

ELECTROMAGNETIC LINE LOCATION/METAL DETECTION (EMLL/MD)

Methodology

Electromagnetic line location techniques (EMLL) are used to locate the magnetic field resulting from an electric current flowing on a line. These magnetic fields can arise from currents already on the line (passive) or currents applied to a line with a transmitter (active). The most common passive signals are generated by live electric lines and re-radiated radio signals. Active signals can be introduced by connecting the transmitter to the line at accessible locations or by induction.

The detection of underground utilities is affected by the composition and construction of the line in question. Utilities detectable with standard line location techniques include any continuously connected metal pipes, cables/wires or utilities with tracer wires. Unless the utilities carry a passive current, they must be exposed at the surface or in accessible utility vaults. These generally include water, electric, natural gas, telephone, and other conduits related to facility operations. Utilities that are not detectable using standard electromagnetic line location techniques include those made of non-electrically conductive materials such as PVC, fiberglass, vitrified clay, and pipes with insulated connections.

Buried objects can also be detected, without direct contact, by using the metal detection technique (MD). This is used to detect buried near surface metal objects such as rebar, manhole covers, USTs, and various metallic debris. The MD transmitter-receiver unit is held above the ground and continuously scanned over the surface. The unit utilizes two orthogonal coils that are separated by a specified distance. One of the coils transmits an electromagnetic signal (primary magnetic field) which in turn produces a secondary magnetic field about the subsurface metal object. Since the receiver coil is orthogonal to the transmitter coil, it is unaffected by the primary field. Therefore, the secondary magnetic fields produced by buried metal object will generate an audible response from the unit. The peak of this response indicates when the unit is directly over the metal object.

The instrumentation we used for the EMLL and MD survey consists of a Radio Detection RD-400 and a Fisher TW-6 inductive pipe and cable locator.

Data Analysis

The EMLL/MD instrumentation indicates the presence of buried metal by emitting an audible tone; there are no recorded data to analyze. Therefore, the locations of buried objects detected with these methods are marked on the ground surface during the survey.

Limitations

The detection of underground utilities is dependent upon the composition and construction of the line of interest, as well as depth. Utilities detectable with standard line location techniques include any continuously connected metal pipes, cables/wires or utilities with tracer wires. Unless carrying a passive current these utilities must be exposed at the surface or accessible in an utility vaults. These generally include water, electric, natural gas, telephone, and other conduits related to facility operations. Utilities that may not be detectable using standard electromagnetic line location techniques include certain abandoned utilities, utilities not exposed at the ground surface, or those made of non-electrically conductive materials such as PVC, fiberglass, vitrified clay, and metal pipes with insulating joints. Pipes generally deeper than about five to seven feet may not be detected.

GROUND PENETRATING RADAR (GPR)

Methodology

Ground penetrating radar is a method that provides a continuous, high resolution cross-section depicting variations in the electrical properties of the shallow subsurface. The method is particularly sensitive to variations in electrical conductivity and electrical permittivity (the ability of a material to hold a charge when an electrical field is applied).

The GPR system operates by radiating electromagnetic pulses into the ground from a transducer (antenna) as it is moved along a traverse. Since most earth materials are transparent to electromagnetic energy, the signal spreads downward into the subsurface. However, when the signal encounters a variation in electrical permittivity, a portion of the electromagnetic energy is reflected back to the surface. When the signal encounters a metal object, all of the incident energy is reflected. The reflected signals are received by the same transducer and are printed in cross-section form on a graphical recorder. Changes in subsurface reflection character on the GPR records can provide information regarding the location of USTs, sumps, buried debris, underground utilities, and variations in the shallow stratigraphy.

The GPR system used was a Geophysical Survey Systems, Inc. SIR-2 Subsurface Interface Radar Systems equipped with a 500 megahertz (MHz) transducer. This transducer is near the center of the available frequency range and is used to provide high resolution at shallow depths.

Data Analysis

GPR records are examined to identify reflection patterns characteristic of USTs, utilities, and other buried debris. Typically, USTs are manifested by broad localized hyperbolic (upside-down "U" shape) reflection patterns that vary in intensity. The intensity of a reflection pattern is usually

dependent upon the condition of the respective UST, its burial depth, and the type of fill over the UST. Utilities and other buried debris are typically manifested by narrow localized hyperbolic reflections that also vary in intensity.

Limitations

The ability to detect subsurface targets is dependent on site specific conditions. These conditions include depth of burial, the size or diameter of the target, the condition of the specific target in question, the type of backfill material associated with the target, and the surface conditions over the target. Under ideal conditions, the GPR can generally detect objects buried to approximately six feet. However, as the clay content in the subsurface increases, the GPR depth of detection decreases. Therefore, it is possible that on-site soil conditions and target features may limit the depth of detection to the upper one to two feet below ground surface.

Project Number : 206-0483-004
P.O. Number : 135699

Dear Mr. Wills,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed.

Kiff Analytical is certified by the State of California (# 2236). If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

Joel Kiff

Brewer, Melissa

2005-02-0016

From: Wills, Martin [mwills@Cambria-env.com]
 Sent: Wednesday, February 02, 2005 10:27 AM
 To: Brewer, Melissa
 Subject: 5755 Broadway Soil and Stockpile Sample confirmation

4

2005-02-0017

Melissa, here's the scoop:

- My mistake on COC dated 2/1/05 - SP-4C should be SP-3D
- All SP samples on this chain should be analyzed for TPHg, BTEX, and lead and are for 5-day TAT. *4 Composite per Marty 2/2*
- TP samples should also be analyzed for 5 oxygenates and are for 24-hour TAT.
- For composite stockpile samples SP-4 and SP-5, please add Oil & Grease analysis to that requested on the COC.. *6 per Marty 2/2*
- Just confirming that STLC, FFLC, and Organic lead have been started. *per Marty 2/2*
TCLP per Marty 2/2

If you have any more questions or I have missed something from our phone conversation, please let me know. Thanks.

Great Day!

From: Wills, Martin [mwills@cambria-env.com]
Sent: Monday, February 28, 2005 3:34 PM
To: Brewer, Melissa
Cc: 'Vasko, Cynthia'
Subject: 5755 Broadway, Oakland

Melissa, we submitted samples for the project on the February 1, 2005. Four samples were on a 24 hr rush due 2/2/05 (TP-1-14 through TP-4-14). The other sample composite SP-3A-D was on a 5 day TAT due on 2/8/05. On 2/3/05, you received a call from me asking if STL could report the results for SP-3A-D by 2/4/05, rather than 2/8/05 as indicated on the COC. You complied. Thanks.

Great Day!

Subject: Calscience Work Order No.: 05-02-0162
Client Reference: 2005-02-0017 / 206-0483-005 / 98995756

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 2/3/2005 and analyzed in accordance with the attached chain-of-custody.

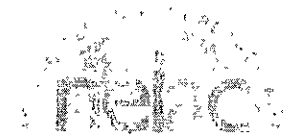

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Assurance Program Manual, applicable standard operating procedures, and other related documentation. The original report of any subcontracted analysis is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Calscience Environmental

Work Order Number: 05-02-0162

<u>Qualifier</u>	<u>Definition</u>
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike or Matrix Spike Duplicate compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Melissa,

Please cancel TCLP benzene analysis and the aquatic bioassay. Continue with Oil & Grease analysis only. Let me know if you have any questions.

Thanks!

RESIDUAL MANAGEMENT PROCEDURE

ISSUED DATE: 08/01/01
CANCELS ISSUE:
ISSUED BY: LRR

RESIDUAL STREAM: SOIL WITH UNLEADED GASOLINE + DIESEL
VENDOR: ALLIED BFI
LOCATION: ALLIED WASTE - MANTECA
9999 SOUTH AUSTIN ROAD
MANTECA, CA 95336

CALIFORNIA - TRANSPORTATION AND RETAIL

BTEX - EPA 80710/8260B (IF BENZENE IS > OR = TO 10 MG/KG THEN TCLP BENZENE IS REQUIRED)

CAM METALS - TTLC METALS - *lead only*
STLC ON ALL TTLC METALS 10 TIMES STLC MAXIMUM
TTLC LEAD => 13 MG/KG REQUIRES ORGANIC LEAD ANALYSIS
IF ANY TTLC TOTAL METAL IS > OR = TO 20 TIMES TCLP REGULATORY LEVELS, TCLP IS REQUIRED

TOTAL PETROLEUM HYDROCARBONS, METHOD 412.1 OR 8015 - GASOLINE AND DIESEL

~~ATLANTA METHOD 8260B (GC/MS)~~

AQUATIC BIOASSAY (FISH TOX) IS ONLY TO BE RUN ON SAMPLES > OR = TO 5000 PPM TPH. AQUATIC BIOASSAY (FISH TOX) - PART 800 OF STANDARD METHODS FOR THE EXAMINATION OF WATER AND WASTEWATER (15TH EDITION)

LABORATORY INSTRUCTIONS (MINIMUM GUIDELINES ONLY)
-ALTERNATE APPROVED TEST METHODS PER SW846 ARE ALSO ACCEPTABLE
-ALL REQUIRED TESTS ON COMPOSITE (MAX 4:1)
-LABORATORY IS TO SUPPLY QA/QC INFORMATION WITH ALL ANALYTICAL REPORTS
~~-CALL OR FAX ALL ANALYSIS TO THE CENTRALIZED RESIDUAL MANAGEMENT TEAM~~

4

2005-02-0017

Melissa, here's the scoop:

- My mistake on COC dated 2/1/05 - SP-4C should be SP-3D
- All SP samples on this chain should be analyzed for TPHg, BTEX, and lead and are for 5-day TAT. 4 COMPOSITE per Marty 2/2
- TP samples should also be analyzed for 5 oxygenates and are for 24-hour TAT.
- For composite stockpile samples SP-4 and SP-5, please add Oil & Grease analysis to that requested on the COC.. 6 per Marty 2/2
- Just confirming that STL, FFE, and Organic lead have been started. per Marty 2/2
TCLP per Marty 2/2

If you have any more questions or I have missed something from our phone conversation, please let me know. Thanks.

Dear Ms. Vasko:

Attached is our report for your samples received on 02/24/2005 12:45

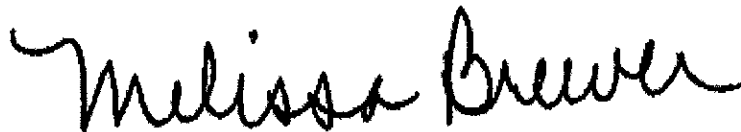

This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 04/10/2005 unless you have requested otherwise.

We appreciate the opportunity to be of service to you. If you have any questions,

You can also contact me via email. My email address is: mbrewer@stl-inc.com

Sincerely,

Melissa Brewer

Dear Ms. Vasko:

Attached is our report for your samples received on 04/05/2005 10:10

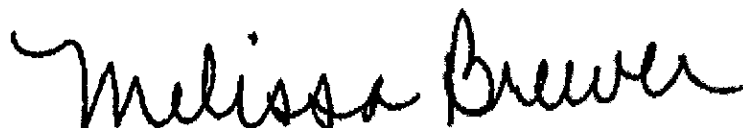

This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 05/20/2005 unless you have requested otherwise.

We appreciate the opportunity to be of service to you. If you have any questions,

You can also contact me via email. My email address is: mbrewer@stl-inc.com

Sincerely,

Melissa Brewer
Project Manager

RESIDUAL MANAGEMENT PROCEDURE

ISSUED DATE: 08/01/01
CANCELS ISSUE:
ISSUED BY: LRR

RESIDUAL STREAM: SOIL WITH UNLEADED GASOLINE + ~~XXXXXXXXXX~~

VENDOR: ALLIED-BFI

LOCATION: ALLIED WASTE - MANTECA
9999 SOUTH AUSTIN ROAD
MANTECA, CA 95336

CALIFORNIA - TRANSPORTATION AND RETAIL

BTEX - EPA 8021B/8260B (IF BENZENE IS > OR = TO 10 MG/KG THEN TCLP BENZENE IS REQUIRED)

CAM METALS = TTLC METALS - **lead only**

STLC ON ALL TTLC METALS 10 TIMES STLC MAXIMUM

TTLC LEAD > 13 MG/KG REQUIRES ORGANIC LEAD ANALYSIS

IF ANY TTLC TOTAL METAL IS > OR = TO 20 TIMES TCLP REGULATORY LEVELS, TCLP IS REQUIRED

TOTAL PETROLEUM HYDROCARBONS, METHOD 418.1 OR 8015 - GASOLINE AND ~~XXXXXXXXXX~~

~~MTBE METHOD 8260B (GC/MS)~~

AQUATIC BIOASSAY (HIGH TOX) IS ONLY TO BE RUN ON SAMPLES > OR = TO 5000 PPM TPH. AQUATIC BIOASSAY (FISH TOX) - PART 800 OF STANDARD METHODS FOR THE EXAMINATION OF WATER AND WASTEWATER (18TH EDITION)

LABORATORY INSTRUCTIONS (MINIMUM GUIDELINES ONLY)

-ALTERNATE APPROVED TEST METHODS PER SW846 ARE ALSO ACCEPTABLE

-ALL REQUIRED TESTS ON COMPOSITE (YANK 3.1.1)

-LABORATORY IS TO SUPPLY QA/QC INFORMATION WITH ALL ANALYTICAL REPORTS

-MAIL OR FAX ALL ANALYSIS TO THE CENTRALIZED RESIDUAL MANAGEMENT TEAM

Dear Ms. Vasko:

Attached is our report for your samples received on 06/10/2005 15:15

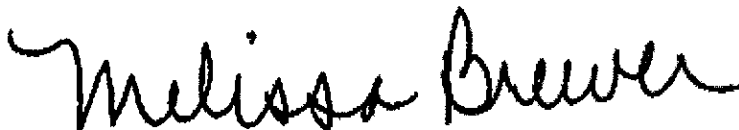

This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 07/25/2005 unless you have requested otherwise.

We appreciate the opportunity to be of service to you. If you have any questions,

You can also contact me via email. My email address is: mbrewer@stl-inc.com

Sincerely,

Melissa Brewer
Project Manager
