Oakland, Ca. 94623-1056

Dear Mr. Toma:

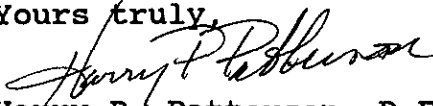

QUARTERLY REPORT for Groundwater Discharge Permit account number 502-51231, for Union Pacific Railroad's Hydrocarbon Recovery System in Oakland, Ca.

Attached is the Third Quarter 1993 "Quarterly Monitoring Report" for our Hydrocarbon Recovery System in Oakland.

If you have any questions on the report, please call me at (402) 271-4078.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Yours truly,

Harry P. Patterson, P.E.
Manager Environmental Site Remediation

1. INTRODUCTION

In accordance to the East Bay Municipal Utility District (EBMUD) permit number 502-51231, this report was prepared by USPCI to provide quarterly monitoring information pertaining to the hydrocarbon recovery and treatment system, and the groundwater monitoring wells located in the Union Pacific Railroad (UPRR) Oakland Trailer on Flat Car (TOFC) rail yard at 1717 Middle Harbor Road in Oakland, California. Background information about the site was presented in the report, "**Hydrocarbon Investigation and Remedial Design**", dated June 10, 1991. The results of the hydrocarbon investigation and a conceptual design of the hydrocarbon recovery and treatment system were also presented in the report. The system design was outlined in the, "**Preliminary Design Report**", dated September 5, 1991. As-built information for the groundwater recovery and treatment system have been presented in the "**Hydrocarbon Recovery System, As-Built Construction Report**", dated July 20, 1992. Any process changes in the hydrocarbon recovery and treatment system were presented in the letter from UPRR dated March 22, 1993, which represented the permit renewal document.

2. GROUNDWATER RECOVERY AND TREATMENT SYSTEM MONITORING

The recovery of floating non aqueous-phase liquid hydrocarbons as diesel (diesel) is accomplished by depressing the groundwater table with total fluids pumps and creating a cone of depression surrounding the recovery wells. The recovered groundwater is treated and discharged to the EBMUD sanitary sewer. The recovery and treatment system consists of three recovery wells, an oil/water separator, a recovered oil storage tank, and an activated carbon treatment system. The location of the three recovery wells and the water treatment facility are indicated on Figure 1.

2.1 SYSTEM OPERATION

During the operating period of June 10 to August 31, 1993, the groundwater recovery and treatment system recovered approximately 430 gallons of diesel and treated more than 335,000 gallons of groundwater. Since start-up on May 12, 1992 until June 10, 1993, the system has recovered approximately 2,330 gallons of diesel. Copies of the field log for the Hydrocarbon Recovery System have been included as Appendix A.

2.2 SYSTEM SAMPLING

On June 30, July 28, and August 31, 1993, water samples were collected from sampling ports located before and after the granular activated carbon vessels. The samples were analyzed for total petroleum hydrocarbons as diesel (TPHd) using EPA method 8015 modified, and EPA method 8020 for benzene, toluene, ethylbenzene, and xylenes (BTEX). On June 14, June 30, July 13, July 28, and August 31, 1993 water samples were collected from between the two granular activated carbon vessels to monitor the breakthrough of organics on the first of two vessels. All analytical results are included as Appendix B.

2.3 ANALYTICAL RESULTS

Analytical results of BTEX and TPHd from the influent to the activated carbon system are indicated in Table 1. The EBMUD discharge limits for BTEX, as well as the analytical results from the sampling of the effluent from the water treatment system are listed in Table 2. A summary of the between carbon results has been included as Table 3.

2.3.1 INFLUENT WATER STREAM TO CARBON UNITS

Total influent BTEX concentrations of the water stream to the carbon units ranged from below analytical detection limits of <0.0003 to <0.0009 milligrams per liter (mg/L) to a high of 0.040 mg/L. Influent TPHd concentrations ranged from 1.2 to 3.2 mg/L.

2.3.2 EFFLUENT WATER STREAM FROM CARBON UNITS

Analytical results indicate that BTEX concentrations for all sampling events were below the analytical detection limit, which ranged from 0.0003 to 0.0009 mg/L. All TPHd concentrations were below detection limits of <0.050 and 0.100 mg/L. The effluent was below the discharge limits in all cases. The discharge limits for BTEX are included in Table 2 with the analytical results.

2.4 GRANULAR ACTIVATED CARBON USAGE

This section provides an estimate of carbon usage for the first or "lead" vessel. Two 2,000 pound granular activated carbon vessels are connected in series to remove organic compounds dissolved in the recovered groundwater. The second vessel prevents a release of water above the discharge limits once the first carbon vessel is loaded with organics or "breakthrough" occurs.

Table 4 presents the estimated amount of spent carbon (adsorption sites loaded with contaminants) and the expected life of the vessel. The estimate in Table 4 indicates that breakthrough should have occurred soon after May 27, 1993. As indicated from the analytical results of the lead vessel,

concentrations of BTEX (Table 3), were detected in the water stream on June 14, 1993. On June 30, 1993, the influent concentrations to the lead vessel, as well as after the lead vessel, were below detection limits. On July 13, 1993, effluent concentrations from the lead vessel were again detected (indicates that the influent concentrations of the lead vessel had returned to above detection limits). On July 21, 1993, the lead carbon vessel was changed out. The second vessel is now plumbed as the lead vessel, and the new carbon vessel has replaced the second vessel. Sample calculations, that are represented in Table 4, were presented with the "Hydrocarbon Recovery System Quarterly Monitoring Report, Second Quarter, 1992".

3. GROUNDWATER MONITORING

As requested by EBMUD, groundwater monitoring information has been included as part of the quarterly report. The water levels in the monitor wells and recovery wells were measured on July 13, 1993. The field log of these measurements is included in Appendix A and results of groundwater elevation measuring activities are presented in Table 5.

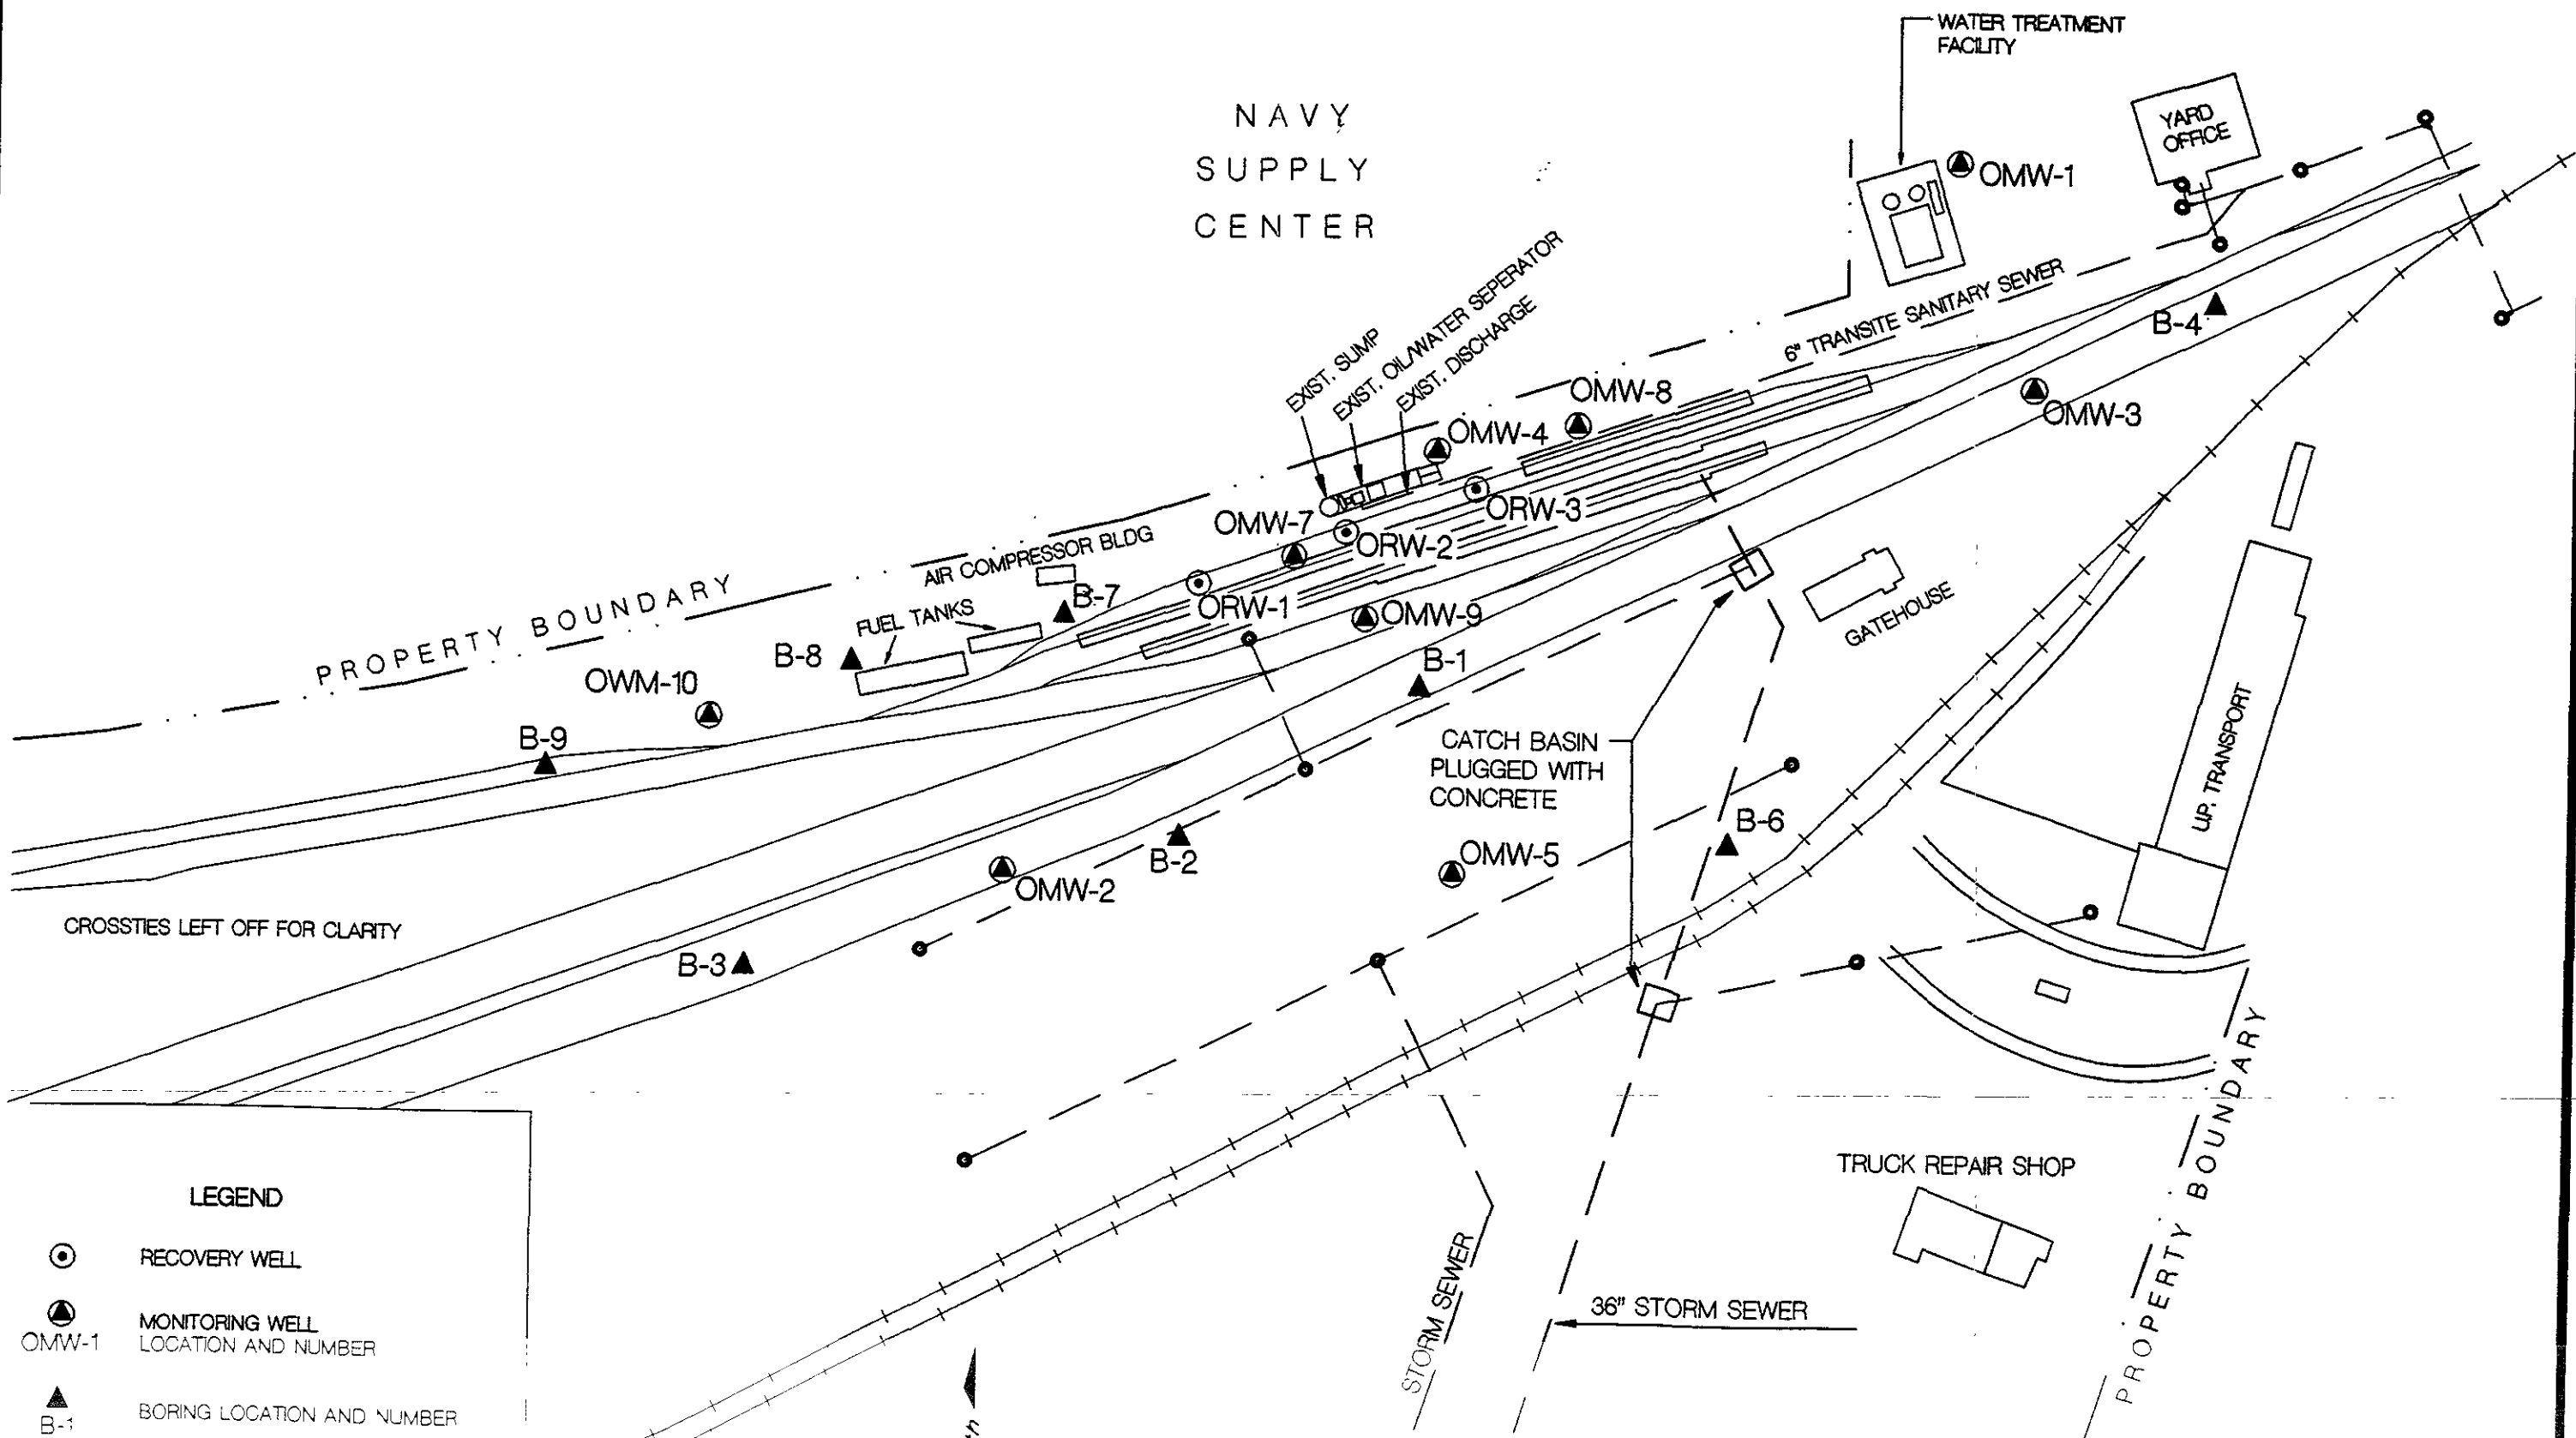

On May 14, 1993, groundwater samples were collected from monitoring wells OMW-1, OMW-2, OMW-3, OMW-5, OMW-6, and OMW-8 (see Table 6). The samples were analyzed for TPHd and BTEX. The analytical results were included with the previous Quarterly Monitoring Report. The next sampling event is scheduled for November 1993. The location of groundwater monitoring wells are indicated on Figure 1. To provide a detailed view of monitoring wells in the spill area, OMW-6 has been omitted from Figure 1. The location of OMW-6 is indicated on Figure 2 in the "Hydrocarbon Investigation and Remedial Design" report, dated June 10, 1993.

4. CONCLUSIONS

Water discharge from the Hydrocarbon Recovery System did not exceed the EBMUD discharge limits during the third quarter of 1993.

NOTES

J = Estimated value below reporting limit.

Due to the presence of product, recovery wells ORW-1, ORW-2, ORW-3, and monitoring wells OMW-4, OMW-7, and OMW-9 are not sampled.

* 0.00062 mg/L was detected in the Trip Blank.

ANALYSIS FOR TOTAL PETROLEUM HYDROCARBONS

Page 2 of 2
QA/QC INFORMATION
SET: 89402

NA = ANALYSIS NOT REQUESTED
ND = ANALYSIS NOT DETECTED ABOVE QUANTITATION LIMIT
ug/L = parts per billion (ppb)

OIL AND GREASE ANALYSIS By Standard Methods Method 5520F:
Minimum Detection Limit in Water: 5000ug/L

Modified EPA SW-846 Method 8015 for Extractable Hydrocarbons:
Minimum Quantitation Limit for Diesel in Water: 50ug/L

EPA SW-846 Method 8015/5030 Total Purgable Petroleum Hydrocarbons:
Minimum Quantitation Limit for Gasoline in Water: 50ug/L

EPA SW-846 Method 8020/BTXE
Minimum Quantitation Limit in Water: 0.3ug/L

| ANALYTE | MS/MSD RECOVERY | RPD | CONTROL LIMIT |
|----------------|-----------------|-----|---------------|
| Benzene: | 126/112 | 12% | 70-130 |
| Toluene: | 113/101 | 11% | 70-130 |
| Ethyl Benzene: | 113/102 | 10% | 70-130 |
| Xylenes: | 115/105 | 9% | 70-130 |
| Diesel: | 92/92 | 0% | 75-125 |

TEAM QUALITY CONTROL PROJECT VERIFICATION

Please help us to provide an error free project to you, by reviewing our log-in information. This will insure that we have properly interpreted your analytical requests. If changes are required, please contact me immediately, so that you will receive the service that you expect. Thank you for your assistance!

Rich

Your account advocate
