Final Remediation Work Plan
Proposed 64th and Christie Residential Building
64th Street and Christie Avenue
Emeryville, California
Fuel Leak Case No. RO0000057
Geotracker Global ID T0600191821

Dear Mr. Detterman:

Submitted herewith for your review is the *Results Final Remediation Work Plan, Proposed 64th and Christie Residential Building, 64th Street and Christie Avenue, Emeryville, California*, dated February 3, 2011 and prepared by PES Environmental, Inc.

I declare, under penalty of perjury, that the information and recommendations contained in the attached document are true and correct to the best of my knowledge.

Very truly yours,
Rockwood Christie LLC

1.0 INTRODUCTION

This Remediation Work Plan (RWP) has been prepared by PES Environmental, Inc. (PES) on behalf of Rockwood Christie LLC for the properties located at 6340 and 6390 Christie Avenue, in Emeryville, California (the “site”). This document describes environmental remediation activities to be conducted in conjunction with development of the properties by constructing a residential building referred to herein as the Proposed 64th and Christie Residential Building. Because of changes in the project design, this RWP is an amendment by way of substitution of the version that was conditionally approved by the City of Emeryville (City) in 2008 (PES, 2008; City, 2008). Rockwood Christie is the property owner and TMG Partners (TMG) is the development manager. This RWP was prepared in accordance with PES’ respective proposals and Service Agreements between PES and Rockwood Christie, dated September 5, 2008 and July 16, 2010.

1.1 Objective

The objective of the RWP is to present remedial measures that will be implemented at the site to mitigate threats to human health and the environment resulting from historical site activities. Implementation of these measures will effectively eliminate the environmental concerns and qualify the site for redevelopment with a residential use.

1.2 Organization

This document is organized, as follows:

- **Section 1.0 – Introduction** – presents objectives and organization of the RWP;
- **Section 2.0 – Site Description, Background, and Proposed Future Use** – presents local and regional geology and hydrogeology, describes site history, and provides a description of the redevelopment project, and the regulatory status of the project;
- **Section 3.0 – Summary of Environmental Investigations** – presents a summary of environmental actions performed at the site and neighboring properties, and describes data gaps identified for the site;
- **Section 4.0 – Evaluation and Selection of Chemicals of Concern** – describes chemicals of potential concern (COPCs) identified for the site for vadose zone soil gas, soil, and groundwater based on the review of available historical data;
- **Section 5.0 – Remedial Goals and Objectives** – presents remedial action objectives for the property;
- **Section 6.0 – Description of Remediation Plan** – presents the components of the proposed remediation plan;

- **Section 7.0 – Soil Removal and Disposal Implementation Plan** - presents the general scope of implementation procedures for the site excavation, the verification sampling and chemical analysis program, and procedures for management of wastes generated during implementation;
- **Section 8.0 – Implementation Schedule** – presents the proposed implementation schedule for the RWP;
- **Section 9.0 – Public Participation Summary** – describes how the public was notified and invited to review and comment on the draft RWP; and
- **Section 10.0 – References** - presents references utilized in the development of this RWP.

2.0 BACKGROUND INFORMATION AND PROPOSED SITE USE

2.1 Current Site Description

The site consists of two parcels, totaling approximately 1.2 acres. The parcels are located near the southeast corner of Christie Avenue and 64th Street in the City of Emeryville, in Alameda County, California (Plate 1). The southern parcel has the address 6340 Christie Avenue and the northern parcel has the address 6390 Christie Avenue. The parcels are identified by Alameda County Assessor’s Parcel Numbers (APNs): 049-1493-006-01, and 049-1493-008-00. As shown on Plate 2, onsite structures include an approximately 12,000 square-foot commercial building and associated parking lot on the northern parcel, and an approximately 14,400 square foot commercial building and associated parking lot on the southern parcel. The site is bounded on the north by 64th Street, on the east and south by Emery Bay Marketplace, and on the west by Christie Avenue. Access to the parking lots is from 64th Street and Christie Avenue.

2.2 Physical Site Setting

2.2.1 Regional Geology and Hydrogeology

The geologic formations in the region belong to the Coast Ranges geomorphic province. The San Andreas rift system divides the formations of this province between those associated with the North American and the Pacific tectonic plates. Rock types within this zone are intermingled due to the sliding action between the plates. Locally, the most significant fault is the Hayward fault. The natural topography is generally steeper on the northeast (uphill) side of the fault and flatter on the southwest side of the fault. Bedrock of the Cretaceous Franciscan assemblage has been mapped on the southwest side of the Hayward fault. This assemblage consists of sandstone, shale, graywacke, serpentinite, chert, limestone, and blueschists. West of the Hayward Fault and overlying the bedrock is the Quaternary Temescal formation, consisting of alluvial fan deposits of the Berkeley Alluvial Plain that originate from

the Berkeley Hills. Soils beneath the Emeryville area were deposited by streams as alluvium eroded from the hills and as tidal flat and tidal channel deposits of the San Francisco Bay, and are commonly referred to as “Older Alluvium” and “Bay Mud” (McLaren, 1989).

The Older Alluvium is a laterally continuous deposit comprised of layers of poorly consolidated clay, silt, sand, and gravel that directly overlie bedrock and is found approximately 20 to 25 feet below grade in the Emeryville area (ACFC and WCC, 1988, *in* McLaren, 1989). The unit is laterally continuous and ranges in thickness from less than 1 foot to greater than 50 feet. Where present, Bay Mud ranges in thickness from approximately 5 to 15 feet and directly overlies the Older Alluvium. Artificial fill materials overlie native Bay Mud over approximately one-third of the land area of Emeryville (Earth Metrics, 1987). The thickness of fill materials ranges from approximately 1 to 15 feet thick. Composition of the fill material is highly variable; boring logs from the area indicate that construction debris (e.g., concrete rubble, wood, glass, plastic, tar paper, and metal) is present within the fill materials (McLaren, 1989).

The soils within the Berkeley Alluvial Plain reportedly have low permeability and low recharge capabilities. The Bay Mud is relatively impermeable and serves as a hydraulic barrier separating Older Alluvium from artificial fill materials. Two main water-bearing zones have been identified and include a shallow zone of less than 60 feet below ground surface (bgs), and a deeper zone of 200 to 300 feet bgs. Regional groundwater flow directions are generally westward toward San Francisco Bay. Groundwater found in the Berkeley Alluvial Plain is designated by the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) as being in Zone B, which indicates that groundwater is unlikely to be used as a drinking water source (SFBRWQCB, 1999). According to the SFBRWQCB report, reasons for the Zone B designation include: (1) the local groundwater system is shallow, with depths of generally less than 300 feet; (2) no identified groundwater production is ongoing; and (3) well yields are not considered sufficient for municipal supply. In addition, City of Emeryville Ordinance No. 07-006 prohibits the use of groundwater for water supply purposes, and potable water is provided by East Bay Municipal Utility District (EBMUD).

2.2.2 Site Geology and Hydrogeology

Based on the results of investigations performed in the site vicinity, soils in the area consist primarily of clayey and silty sand fill material overlying native Bay Mud. In the area north of 64th Street, previously used as the City of Emeryville’s landfill, the fill material contains inert construction materials, including tarpaper, wood, plastic, glass, and rubber. These materials may also be present beneath the subject property. Fill thickness is estimated at approximately 3 to 15 feet in the site vicinity. The Bay Mud consists of clays and organic material.

Depth to shallow groundwater in the site vicinity has been observed to range between 4 to 7 feet bgs. Based on surface topography of the site vicinity and orientation with respect to San Francisco Bay, the groundwater flow direction is expected to be westerly, flowing from the Berkeley hills in the east, towards San Francisco Bay to the west. Based on quarterly sampling

events conducted in 1999, Aqua Science Engineers (ASE) reported that the groundwater flow direction was south-to-southwest (ASE, 1999a; ASE 1999b). However, ASE noted that the site groundwater flow direction was anomalous to the expected regional westerly groundwater flow direction (ASE, 1999a). As described below in Section 6.1, the groundwater flow direction will be further evaluated under this RWP, as part of a pre-excavation investigation.

2.3 Site Development and Use History

2.3.1 History of Site Development

The site is located in a former industrial area of Emeryville, which has been undergoing redevelopment for residential and commercial purposes since the mid-1980s. The land was historically tidal mud flats, and was reclaimed from the bay with imported soils sometime between the late 1930s and early 1940s. Review of Sanborn Fire Insurance Maps and aerial photographs indicate that the site was part of San Francisco Bay in 1931. Aerial photos from 1947, 1949, and 1959 indicate that area had been reclaimed from the Bay with fill but the site was not developed. The existing on-site buildings, believed to be the original construction on the site, were reportedly built in 1966.

2.3.2 History of Site Use

2.3.2.1 6340 Christie Avenue

Sanborn maps from 1967 and 1969 indicate that 6340 Christie Avenue was used for industrial machinery warehousing (PES, 2005a). Lerer Brothers Transmission Service operated at the site from approximately 1980 through 1998, when business operations at the site were discontinued. The building was subsequently leased to a tenant who began interior and exterior building improvements, but never completed the work or occupied the site. The tenant improvements included constructing a mezzanine area, construction of office and hallway areas, and adding an exterior concrete pad intended for a solid waste container enclosure.

In 1988, a 2,000-gallon gasoline underground storage tank (UST) was removed from the southeast corner of the site. No evidence of soil contamination was noted at the time of the UST removal and no samples were reportedly collected for analysis (ASE, 1998). Nevertheless, investigations were subsequently conducted to assess for contamination in soil and groundwater from potential operational releases (spillage during filling, etc.). Details of these investigations are presented in Section 3.0.

Alameda County Department of Environmental Health (ACDEH) records indicate that Lerer Brothers Transmission used motor oil, antifreeze, solvent and other typical truck repair chemicals, and generated waste oil, sludge, and solvent. During a 2005 regulatory file review for the property, no violations were on file concerning hazardous material use or storage at the former Lerer Brothers Transmission facility and no information was available concerning the

former UST or other hazardous material uses or storage at the site prior to Lerer Brothers Transmission's occupancy (PES, 2005a). The building is currently vacant.

2.3.2.2 6390 Christie Avenue

Sanborn maps from 1967 and 1969 indicate that a tool warehouse was present in the larger western portion of this building and a photo lab was present in the smaller eastern portion (PES, 2005b). In 1990, a subsurface truck bay and associated sumps were removed and replaced with a parking lot. No evidence of contamination was reportedly encountered during these construction activities. Historical tenants at the larger tenant space have been Inter-Tel Technologies (1994 to 2006) and Sybase (1989 to 1994). Historical tenants in the smaller space reportedly have included an advertising firm, Dictaphone, and a software developer. The building is currently vacant.

No historical records concerning hazardous material use and storage at the facility were identified during PES' 2005 ESA, and no historical recognized environmental conditions were identified.

2.4 Proposed Site Development

Redevelopment plans consist of demolition of the existing structures and removal of all existing pavements, and construction of a new five-story tall wood-framed building that will cover nearly the total surface area of the site. Plate 3 depicts the proposed 64th and Christie Residential Building. The lowest level will be a subgrade parking garage. The ground level will consist of additional parking, a leasing office, and residential units. There will be four floor levels used for residential purposes above the ground-level floor. Ground-level units will be situated above the subgrade parking level; no residential areas will be situated directly on soil.

Based on the preliminary building design, it is understood that the structure will be supported by a concrete mat foundation placed over re-compacted fill. Over-excavation will be required to remove existing geotechnically-unsuitable fill from the site, which is anticipated to be present to depths ranging from 11 to 15 feet bgs (Rockridge, 2010). According to the Rockridge report, the unsuitable fill is underlain by "interbedded layers of medium dense to dense clayey and silty sand and stiff to very stiff clay and silt with varying silt content." The subgrade parking level will be constructed over the mat foundation with the floor at approximately 10 feet bgs. It will be accessed by a ramp located inside the garage. The footprint of the subgrade parking level, which encompasses the majority of the subject property, is shown in plan view and in cross-section on Plate 3. Based on the proposed depth of development and shallow groundwater conditions found at the site, the concrete floor slab and subgrade basement walls will have a water-proofing barrier. The lower garage level will be mechanically ventilated.

2.5 Regulatory Status

2.5.1 6340 Christie Avenue

On behalf of Rockwood Christie, on November 17, 2008 PES submitted a request for case closure for the leaking underground storage tank (LUST) case related to the former 2,000-gallon gasoline UST. ACDEH subsequently sent a letter to TMG dated April 3, 2009 (ACDEH, 2009), requesting a work plan that would address technical comments contained in the April 3 letter to TMG. In a response to ACDEH dated August 4, 2009, Rockwood Christie indicated that further assessment and closure of the UST case would be performed prior to site redevelopment (Rockwood Christie, 2009). This assessment is expected to occur during the first to second quarters of 2011.

2.5.2 6390 Christie Avenue

There are no known environmental issues that warrant ongoing regulatory involvement or oversight at the 6390 Christie property.

3.0 SUMMARY OF ENVIRONMENTAL INVESTIGATIONS

This section summarizes the results of environmental investigations conducted at and in the vicinity of the site. The information provided below was summarized from available documentation.

3.1 Previous Investigations

Numerous environmental investigations have been conducted on the subject property between 1988 and 2005. The previous investigations were focused primarily on Phase I and II assessments for potential property transactions and investigations related to the former UST on the 6340 Christie Avenue parcel. Investigations reviewed as part of the RWP include the following:

6340 Christie Avenue

- A 1988 UST removal oversight (ACDEH, 1988);
- A 1998 soil and groundwater assessment of the Lerer Brothers Transmission Service site included soil and groundwater sampling at five locations (ASE, 1998);
- A 1999 groundwater study for the Lerer Brothers Transmission Service site included installation and sampling of three groundwater monitoring wells (ASE, 1999a); and
- A 1999 supplemental groundwater study including grab groundwater sampling at two off-site locations and conducting quarterly groundwater monitoring (ASE, 1999b); and

- A 2004 limited Phase II investigation consisting of soil vapor, soil matrix, and groundwater sampling (PES, 2005c).

6390 Christie Avenue

- A 2004 limited Phase II investigation consisting of soil vapor, soil matrix, and groundwater sampling (PES, 2005c).

Copies of these investigation reports are provided on CD-ROM in Appendix A.

3.2 Summary of Site Soil Conditions

Twenty-five soil samples (including eight composite soil samples) were collected from the property between depths of approximately 2 and 7 feet bgs. Sampling locations are shown on Plate 4. Analyses included: total petroleum hydrocarbons (TPH) quantified as diesel (TPHd); TPH quantified as motor oil (TPHmo); TPH quantified as gasoline (TPHg); volatile organic compounds (VOCs); polychlorinated biphenyls (PCBs); benzene, toluene, ethylbenzene, and total xylenes (BTEX); methyl tert-butyl ether (MTBE); and/or Leaking Underground Fuel Tank (LUFT) metals (cadmium, chromium, lead, nickel, and zinc), as shown in Tables 1 and 2.

3.2.1 Organic Analytical Results

The organic analytical results indicated the presence of petroleum hydrocarbons (TPHmo and TPHg) and petroleum hydrocarbon-related constituents (BTEX) at varying concentrations in soil samples collected across the site. No PCBs were detected in two composite samples of shallow soil (i.e., 2 feet bgs) at the site. The results are presented in Table 1 and summarized below:

- TPHmo was detected in 10 of 12 soil samples at concentrations ranging from 13 to 3,600 milligrams per kilogram (mg/kg);
- TPHg was detected in 4 of 20 soil samples at concentrations ranging from 0.077 to 1,400 mg/kg;
- Benzene was detected in 2 of 20 soil samples at concentrations of 0.009 and 0.011 mg/kg;
- Toluene was detected in 2 of 20 soil samples at concentrations of 0.0083 and 25 mg/kg;
- Ethylbenzene was detected in 5 of 20 soil samples at concentrations ranging from 0.0073 to 13 mg/kg; and
- Total xylenes were detected in 6 of 20 soil samples at concentrations ranging from 0.0087 to 27 mg/kg.

In general, TPHmo was detected at relatively low concentrations in soil samples across the site, except soil samples SB-4-2 and SB-6-7, where it was detected at concentrations of 3,600 and 2,600 mg/kg, respectively (Table 1). Boring SB-4 is located in the vicinity of the former UST, located southeast of the 6430 Christie Avenue building (Plate 4). Boring SB-6 is located in the central portion of the site between the two existing buildings. The highest concentration of TPHg (1,400 mg/kg) was detected in a sample collected in boring BH-A, also located near the former UST. Elevated concentrations of VOCs related to fuel hydrocarbons were identified in the vicinity of the former UST (i.e., at boring BH-A and well MW-1). The highest toluene concentration (25 mg/kg) and an elevated total xylenes concentration (15 mg/kg) are co-located with the highest TPHg concentration at boring BH-A. No other VOCs were detected.

3.2.2 Inorganic Analytical Results

On the basis of the limited analytical suite, the inorganic analytical results indicated the presence of the five metals (cadmium, total chromium, lead, nickel, and zinc) in soil samples at varying concentrations. The results are presented in Table 2 and summarized below:

- Cadmium was detected in one of six composite soil samples at a concentration of 2.6 mg/kg;
- Total chromium was detected in six of six composite soil samples at concentrations ranging from 21 to 55 mg/kg;
- Lead was detected in 14 of 14 individual and composite soil samples at concentrations ranging from 6.1 to 760 mg/kg;
- Nickel was detected in six of six composite soil samples at concentrations ranging from 23 to 56 mg/kg; and
- Zinc was detected in six of six composite soil samples at concentrations ranging from 27 to 1,800 mg/kg.

The distribution of metals concentrations in the soil samples appears consistent with normal variations observed in background soil conditions, with the following exceptions: (1) lead was detected at an elevated concentration (310 mg/kg) in the 4-foot bgs sample collected from boring BH-D; and (2) elevated concentrations of lead (760 mg/kg) and zinc (1,800 mg/kg) were detected in the composite soil sample from boring SB-6 (soil samples SB-6-2 and SB-6-7). Boring BH-D is located in the vicinity of the former UST, and boring SB-6 is in the central portion of the site.

3.3 Summary of Site Groundwater Conditions

Between 1998 and 2004, groundwater samples were collected from three groundwater monitoring wells (MW-1 through MW-3) and at 14 grab sampling locations. Sampling locations are shown on Plate 4. Five rounds of groundwater sampling were conducted at the wells in 1999. Analyses included TPHd; TPHmo, TPHg, VOCs, BTEX, MTBE, and/or dissolved lead.

3.3.1 Organic Analytical Results - Groundwater

The analytical results for the initial grab groundwater sampling conducted in October 1998 indicated the presence of elevated concentrations of petroleum hydrocarbons (TPHg) and petroleum hydrocarbon-related constituents (BTEX) in groundwater beneath the site (Table 3). Grab groundwater samples at five locations (BH-A through BH-C, BH-F, and BH-G) contained TPHg at concentrations ranging from 65 to 620,000 micrograms per liter [$\mu\text{g/L}$]. The highest detected concentrations of benzene, toluene, ethylbenzene, and total xylenes (up to 1,200, 4,900, 16,000, and 64,000 $\mu\text{g/L}$, respectively) were at boring BH-A along with the highest concentration of TPHg. TPHd and TPHmo analyses were not performed on these grab groundwater samples.

Monitoring wells MW-1, MW-2, and MW-3 were installed and sampled in January 1999. Groundwater samples from the wells were analyzed for TPHg, BTEX, and MTBE. Concentrations of TPHg and BTEX in the groundwater samples from the monitoring wells were significantly lower than those previously detected in the grab groundwater samples at the site. Groundwater samples collected from monitoring wells MW-1 and MW-2 (located in the vicinity of the former UST) contained TPHg at concentrations of 730 and 710 $\mu\text{g/L}$, respectively. The sample from the downgradient well, MW-3, did not have detectable concentrations of TPHg.

Petroleum hydrocarbon concentrations in monitoring well samples remained relatively consistent (i.e., same order of magnitude) between the initial sampling round in the January 1999 and the final monitoring well sampling round in December 1999. At that time, benzene, toluene, ethylbenzene, and total xylenes concentrations in groundwater samples were 72, 10, 93, and 220 $\mu\text{g/L}$, respectively, at well MW-1, and 8.6, 4.6, 5.8, and 29 $\mu\text{g/L}$, respectively, at well MW-2; BTEX compounds were not detected at or above reporting limits at well MW-3.

In 2004, grab groundwater samples were collected at seven locations (GW-1 through GW-7) by PES (Plate 4). TPHd was detected in five of the seven locations at concentrations ranging from 4,200 to 49,000 $\mu\text{g/L}$. The highest detected TPHd concentration (49,000 $\mu\text{g/L}$) was detected in the most downgradient sample, GW-7, assuming a southwesterly/westerly groundwater flow direction. TPHmo was detected in samples from two locations, GW-2 and GW-3 (both located on the northern portion of the property) at 3,300 and 7,400 $\mu\text{g/L}$, respectively. Laboratory reporting limits for TPHd and TPHmo were elevated for these

samples. TPHg was detected at two locations, GW-2 and GW-5, at concentrations of 37 and 110 $\mu\text{g/L}$, respectively. Where detected, BTEX concentrations were relatively low, ranging from 0.74 to 21 $\mu\text{g/L}$ (Table 3).

3.3.2 Inorganic Analytical Results - Groundwater

Lead was the only inorganic analyte for groundwater samples collected at the site. Lead was not detected at or above the reporting limit (0.005 $\mu\text{g/L}$) in the groundwater samples collected from the three monitoring wells (Table 3).

3.4 Summary of Site Soil Vapor Conditions

During the 2004 subsurface investigation, twelve soil vapor samples were collected at the site from depths ranging from approximately 1 to 3 feet bgs (PES, 2005c). The sampling locations are shown on Plate 4. Samples were analyzed for VOCs using U.S. EPA Test Method 8260, TPH in the C-5 to C-11 range using U.S. EPA Test Method 8260, and methane using a GEM 500 Landfill Gas Meter. The analytical results are presented in Table 4 and summarized below:

- Cis-1,2-dichloroethylene (cis-1,2-DCE) was detected at one sample location at a concentration of 0.15 $\mu\text{g/L}$;
- Benzene was detected at five sample locations at concentrations ranging from 0.13 to 5.5 $\mu\text{g/L}$;
- Toluene was detected at six sample locations at concentrations ranging from 0.10 to 1.4 $\mu\text{g/L}$;
- m,p-Xylenes were detected at seven sample locations at concentrations ranging from 0.10 to 1.4 $\mu\text{g/L}$;
- TPH was detected at eleven sample locations at concentrations ranging from 5.6 to 830 $\mu\text{g/L}$; and
- Methane was detected at ten sample locations at concentrations ranging from 0.2 to 85 percent.

3.5 Neighboring Properties

Regional filling of the historical bay front in Emeryville area with undocumented fill and, more specifically, widespread historical industrial uses in the EmeryBay Marketplace area warrants evaluation of known environmental conditions of neighboring properties. Neighboring properties where environmental data are available include: (1) the Former Nielsen Trucking Property (Nielsen Property) located immediately east of the site; (2) the EmeryBay Marketplace (EBM) to the east/southeast of the site; and (3) the Avenue64 development

(formerly Pinnacle at Emeryville) to the west of the site at 6335 Christie Avenue, 1707 64th Street, and 1715 64th Street; and (4) the Bay Center Apartment Complex located immediately to the north of the site. Reports used for evaluation of environmental conditions on neighboring properties are listed in Section 10.0.

Petroleum hydrocarbons (TPHd and TPHmo) and petroleum hydrocarbon constituents (BTEX) and dissolved metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel; thallium, zinc, etc.) have been detected in groundwater samples collected at these nearby sites. Groundwater samples collected for the former Nielsen site (located upgradient of the site) contained elevated concentrations of various petroleum hydrocarbons. During the most recent monitoring event in October 1996, TPHd was detected at 15,000 $\mu\text{g/L}$, and TPHmo at 2,300 $\mu\text{g/L}$ (PES, 1996).

Based on the upgradient to cross-gradient location of the Nielsen property relative to the site, migration of petroleum hydrocarbons and/or dissolved metals in Nielsen property groundwater to beneath the site may have occurred.

3.6 Environmental Investigation Data Gaps

Based on a review of the results of prior environmental investigations conducted on the subject property and on neighboring sites, several areas on the subject property were identified where limited or no environmental information was available for assessing current site conditions. These “data gaps” are the result of prior investigations being directed to specific on-site environmental issues (such as the UST), with limited sampling and analytical programs, and not towards characterization of the site as a whole for remediation planning and/or waste management purposes. Identified data gaps include the following:

- Additional subsurface soil testing is needed prior to site development for classifying soil to be excavated for disposal purposes; and
- Groundwater is known to contain petroleum hydrocarbons and several VOCs. Additional investigation, utilizing monitoring wells, is needed to further evaluate groundwater conditions, distribution of contaminants of concern and assessment of groundwater flow direction.

4.0 EVALUATION OF CONSTITUENTS OF POTENTIAL CONCERN

Using known environmental information about the site, PES conducted an evaluation of organic and inorganic constituents of potential concern (COPCs) to identify those chemicals that are available through identified complete exposure pathways and exceed regulatory standards and guidelines applicable to the subject property. The evaluation includes the following steps: (1) identification of complete exposure pathways available to humans and the environment based on the proposed development of the site, and (2) comparison of organic and

inorganic chemicals found or suspected to be present on the site against applicable regulatory standards and guidelines.

4.1 Exposure Pathways

Based on the anticipated future development and uses at the site, complete exposure pathways are likely present for construction workers and future office/residential occupants. The complete exposure pathways include the following:

- Vadose Zone Soils – direct human contact, ingestion and inhalation (via dust) pathways for construction workers during site development and subsequent subsurface maintenance and repair activities;
- Shallow Groundwater – direct human contact and inhalation pathways for construction workers, office workers, and residents using the subgrade parking level, inhalation pathway via vapor intrusion of volatile compounds into buildings; and
- Soil Vapor – inhalation pathways via vapor intrusion of volatile compounds into portions of the building.

Details of the exposure pathway evaluation are provided in the following sections.

4.1.1 Direct Contact

The exposure depth for direct human contact with contaminated soils is assumed by DTSC and SFBRWQCB to be 10 feet bgs. Direct human contact, or dermal contact, may occur during construction activities and future subsurface infrastructure maintenance or repair activities. Contact with soil by a future office worker/resident is considered unlikely, particularly based on the proposed high-density above-grade residential usage and that site soil will be excavated to a depth of 11 to 15 feet bgs for construction of the building. Along some of the exterior building perimeter, soil may be excavated to depths ranging from 2 to 4 feet bgs for geotechnical and/or landscaping purposes. While unlikely, direct human contact to affected soil by construction workers is considered a complete pathway for the COPC evaluation.

With the shallow water table depths at the site (4 to 7 feet bgs), direct contact with affected groundwater by construction workers is possible and is considered a complete pathway for this evaluation. Direct contact by future residents or office workers is also considered a complete pathway in the event that groundwater infiltrates the subgrade garage level during high water table conditions.

Mitigation of the direct contact exposure pathway for affected soil and groundwater will include adherence by the on-site construction workers to a site-specific Health & Safety Plan (HASP) prepared for the proposed development activities. Further discussion of the HASP is provided in Section 7.1.3. Mitigation of the direct exposure pathway to residents and office

workers will include soil excavation and installation of engineering controls (refer to Sections 6.2 through 6.5).

4.1.2 Ingestion

Ingestion of soil may occur during site development construction activities or during future subsurface infrastructure maintenance or repair activities. Direct contact by future residents or office workers is not considered likely and not a complete pathway. Mitigation of the ingestion exposure pathway for affected soil includes adherence by the on-site construction workers to the HASP.

There are currently no known groundwater production wells in the vicinity of the site and shallow groundwater will not be readily available to residents or office workers. While ingestion of groundwater could occur in the event that a water production well was installed on the subject property, as described in Section 2.2.1 there is a City ordinance prohibiting the use of groundwater for water supply (i.e., drinking water) purposes. Ingestion of groundwater is considered unlikely during development construction activities. Therefore, groundwater ingestion is not considered as a current complete exposure pathway and is considered unlikely in the future.

4.1.3 Inhalation

Inhalation exposures include constituents that are either volatile at atmospheric conditions or are carried on dust particles. Volatile constituents previously detected in shallow groundwater included TPHg and BTEX. Detected volatile constituents in soil vapor included methane, benzene, and TPH. Inhalation may occur during construction activities, future infrastructure maintenance or repair and is considered a complete exposure pathway. Inhalation during construction activities will be mitigated by adherence to the site-specific worker HASP and implementation of a site-specific Dust and Odor Management Plan. Further discussion of the Dust and Odor Management Plan is presented in Section 7.1.4.

A complete inhalation exposure pathway for future residents and office workers is considered present in those portions of the building (subsurface garage level) where the structure is in direct contact with native¹ soils. Mitigation for this pathway includes implementation of remedial measures during site development to remove soil containing volatile compounds as well as the use of waterproofing barrier systems, which also limit infiltration of the soil vapors.

4.1.4 Potential Impacts to Surface Water

San Francisco Bay is located approximately 700 feet west of the site. Based on westerly to southwesterly groundwater flow (as observed at the site and at nearby properties), it is likely

¹ In this context, native soils are considered those currently present on the site and include naturally-placed sedimentary deposits (e.g. Bay Muds) and historically-placed import fills.

that groundwater beneath the site will eventually flow to San Francisco Bay. Previously detected constituents at the site include TPHg, TPHd, TPHmo, and relatively low concentrations of BTEX.

While detectable TPHg and BTEX found in shallow groundwater appear to be the result of past undocumented releases of the former UST, the areal extent of affected groundwater appears to be localized to the southeastern and south-central portions of the site. Historical groundwater sampling at well MW-3, formerly located along the southern property line and downgradient of the former UST, suggest that TPHg and BTEX concentrations decrease significantly over the relatively short distance from the former UST, and similarly likely fall below regulatory screening levels over a short distance. Based on the localized nature of the TPHg- and BTEX-affected groundwater, a complete exposure pathway to surface waters of San Francisco Bay is not considered present.

The TPHd and TPHmo constituents detected in groundwater beneath the site have been detected at one or more off-site and upgradient locations and are considered part of a regionally-impacted shallow groundwater zone. Groundwater sampling on properties to the west of the site have also identified detectable concentrations of TPHd and TPHmo and have attributed these findings to the regional plume. It is not reasonable to assume that migration of groundwater from the site would be responsible for aquatic impacts in San Francisco Bay located 700 feet downgradient of the site. Therefore, this pathway is not considered to be complete for the subject property.

4.2 Constituents of Potential Concern Evaluation

Based on the above evaluation, COPC evaluations were conducted for each media at the site exhibiting the potential for complete exposure pathways. These evaluations involved comparison of identified and suspected organic and inorganic constituents in site vadose zone soil, shallow groundwater, and soil vapor to a variety of screening criteria to determine which constituents are of concern and whether further evaluation and cleanup goal development might be needed.

4.2.1 COPC Evaluation for Vadose Zone Soils

A COPC evaluation was performed on each constituent detected in onsite vadose-zone soils during the prior investigations or suspected to be widely present from past bay-front filling or historical activities. The chemicals were evaluated for frequency of detections above the following screening criteria: (1) the SFBRWQCB Environmental Screening Levels (ESLs) for Direct Exposure for Residential Use (Residential Direct Exposure ESL; SFBRWQCB, 2008); (2) ESLs for Soil Leaching Levels for Non-Drinking Water (Leaching – Non Drinking ESL); (3) ESLs for Soil Leaching Levels for Drinking Water (Leaching – Drinking ESL); (4) California Environmental Protection Agency (Cal/EPA) Human Health Screening Levels (CHHSLs) for soil in a residential setting (Cal/EPA, 2005); and (5) U.S. EPA Region 9 Regional Screening Levels (RSLs) for soil in a residential setting (U.S. EPA, 2010).

Chemicals in soil that exceed one or more of the screening levels are shown graphically on Plate 5 and summarized in the table below:

Identified Constituent	Range of Detection	Frequency of Exceedence	Exceeded Regulatory Criteria
<i>Organic Constituents</i>			
TPHmo	13 to 3,600 mg/kg	3/12	Residential Direct Exposure ESL(1,800 mg/kg)
TPHg	0.077 to 1,400 mg/kg	2/20	Residential Direct Exposure ESL (540 mg/kg) Leaching-Non Drinking ESL (180 mg/kg) Leaching-Drinking ESL (83 mg/kg)
Benzene	0.009 to 0.11 mg/kg	0/20	No exceedences
Toluene	0.0083 to 25 mg/kg	1/20	Residential Direct Exposure ESL (320 mg/kg) Leaching-Non-Drinking ESL (9.3 mg/kg) Leaching-Drinking ESL (2.9 mg/kg)
Ethylbenzene	0.0073 to 13 mg/kg	2/20	Residential Direct Exposure ESL (2.3 mg/kg) Leaching-Non-Drinking ESL (4.7 mg/kg) Leaching-Drinking ESL (3.3 mg/kg)
Total Xylenes	0.027 to 27 mg/kg	2/20	Leaching-Non-Drinking ESL (11 mg/kg) Leaching-Drinking ESL (2.3 mg/kg)
<i>Inorganic Constituents</i>			
Cadmium	2.6	1/6	Residential Direct Exposure ESL (1.7 mg/kg) Residential CHHSL (1.7 mg/kg)
Total Chromium	2.6 to 49 mg/kg	0/6	No exceedences
Lead	6.1 to 760 mg/kg	2/14	Residential Direct Exposure ESL (260 mg/kg) Residential CHHSL (150 mg/kg) Residential RSL (400 mg/kg)
Nickel	40 to 56 mg/kg	0/6	No exceedences
Zinc	62 to 1,800 mg/kg	0/6	No exceedences

After comparison with the aforementioned regulatory screening levels, COPCs in vadose zone soils were selected according to the following criteria:

- Constituents that are frequently detected (i.e., generally at a frequency of greater than or equal to 5 percent) at concentrations greater than their respective regulatory guidance levels and background conditions were designated as COPCs and evaluated further;
- Inorganic constituents frequently detected (i.e., generally at a frequency of greater than or equal to 5 percent) at concentrations greater than their respective regulatory guidance levels, but less than or similar to background soil conditions were designated as COPCs and not evaluated further;
- Constituents infrequently detected (i.e., generally at a frequency of less than 5 percent) at concentrations greater than their respective regulatory guidance levels were not designated as COPCs or evaluated further;
- Constituents with a very limited number of data points or suspected of being presence based on data from surrounding properties were designated as provisional COPCs pending data from the proposed pre-excavation site investigation; and
- Constituents not detected or only detected at concentrations less than their respective regulatory guidance levels were not designated as COPCs or evaluated further.

The results of the selection process identified the following COPCs for vadose zone soils:

Heavy-fraction Petroleum Hydrocarbons: TPHmo was detected above RWQCB ESLs in three out of twelve samples. Two of the exceedences were in shallow soil (2 feet bgs) and one was in deeper soil (7 feet bgs). It is likely the presence of TPHmo in shallow soil is due to past site activities and has therefore been included as a COPC.

Light-Fraction Petroleum Hydrocarbons and Aromatic Constituents: TPHg, toluene, and ethylbenzene were detected above three RWQCB ESLs in up to two out of twenty samples; total xylenes were detected above two RWQCB ESLs in two out of twenty samples. The sample with the highest concentration of these three constituents (BH-A at 6 feet bgs) was located near the former gasoline UST area. It is likely the presence of light fraction petroleum hydrocarbons and aromatic constituents is related to the UST area; therefore, these chemicals have been included as COPCs.

Lead and Cadmium: Lead and cadmium were identified in 2 of 14 and 1 of 6 samples, respectively, above the regulatory screening criteria for residential direct contact, residential CHHSL and/or residential ESL. The single detection of cadmium is just slightly above the

CHHSL/ESL value and is below the RSL value of 70 mg/kg (Table 2)². Therefore, cadmium is not included as a COPC. While the exceedence for lead was identified in only a few samples and may be the result of digestion of a metallic debris fragment, lead is included as a provisional COPC pending evaluation of additional data obtained during the proposed pre-excavation site investigation.

4.2.2 COPC Evaluation for Shallow Groundwater

A COPC evaluation was performed on each compound detected in onsite groundwater during the prior investigations. The chemicals were evaluated for the frequency of detections above the following screening criteria: (1) ESLs for Non-Drinking Water Ceiling Level (Non-DW Ceiling ESL); (2) ESLs for Drinking Water Ceiling Level (DW Ceiling ESL); (3) ESLs for Drinking Water (DW ESL); (4) ESLs for Evaluation of Potential Vapor Intrusion Concerns (Residential Vapor Intrusion ESL); (5) California Maximum Contaminant Level (California MCL) for Drinking Water (Cal/EPA, 2008); and (6) the U.S. EPA National Primary Drinking Water Standards (Federal Primary MCL; U.S. EPA, 2009).

Chemicals in groundwater that exceed one or more of the screening levels are shown graphically on Plate 6 and summarized in the table below:

Identified Constituent	Range of Detection	Frequency of Exceedence	Exceeded Regulatory Criteria
TPHd	4,200 to 49,000 µg/L	5/7	Non-DW Ceiling ESL (2,500 µg/L) DW Ceiling ESL (100 µg/L) DW ESL (210 µg/L)
TPHmo	3,300 to 7,400 µg/L	2/7	Non-DW Ceiling ESL (2,500 µg/L) DW Ceiling ESL (100 µg/L) DW ESL (210 µg/L)
TPHg	37 to 620,000 µg/L	18/29*	Non-DW Ceiling ESL (5,000 µg/L) DW Ceiling ESL (100 µg/L) DW ESL (210 µg/L)
Benzene	0.81 to 1,200 µg/L	16/29*	Non-DW Ceiling ESL (20,000 µg/L) DW Ceiling ESL (170 µg/L) DW ESL (1 µg/L) Residential Vapor Intrusion (540 µg/L) California MCL (1 µg/L) Federal Primary MCL (1 µg/L)

² Additionally, the RWQCB has indicated that it anticipates that regulatory screening criteria for cadmium will be recalculated based on U.S. EPA screening levels for incidental soil ingestion, and that the new screening levels will be higher than the single detected concentration at the site (SFBRWQCB, 2009).

Toluene	0.74 to 4,900 $\mu\text{g/L}$	3/29*	Non-DW Ceiling ESL (400 $\mu\text{g/L}$) DW Ceiling ESL (40 $\mu\text{g/L}$) DW ESL (150 $\mu\text{g/L}$) California MCL (150 $\mu\text{g/L}$) Federal Primary MCL (1,000 $\mu\text{g/L}$)
Ethylbenzene	1.4 to 16,000 $\mu\text{g/L}$	2/29*	Non-DW Ceiling ESL (300 $\mu\text{g/L}$) DW Ceiling ESL (30 $\mu\text{g/L}$) DW ESL (300 $\mu\text{g/L}$) California MCL (300 $\mu\text{g/L}$) Federal Primary MCL (700 $\mu\text{g/L}$)
Total Xylenes	0.74 to 4,900 $\mu\text{g/L}$	6/29*	DW Ceiling ESL (20 $\mu\text{g/L}$) DW ESL (1,800 $\mu\text{g/L}$) California MCL (1,750 $\mu\text{g/L}$) Federal Primary MCL (10,00 $\mu\text{g/L}$)
MTBE	21 $\mu\text{g/L}$	1/29*	DW Ceiling ESL (5 $\mu\text{g/L}$) DW ESL (13 $\mu\text{g/L}$) California MCL (13 $\mu\text{g/L}$)
* Data include five rounds from the same wells.			

Light-Fraction Petroleum Hydrocarbons: In general, detected TPHg concentrations exceeded regulatory screening levels related to drinking water criteria (i.e., drinking water ceiling ESLs, drinking water ESLs, and/or MCLs). The highest concentrations of TPHg, which also exceeded the non-drinking water ceiling ESL, were detected in grab groundwater samples from sampling locations BH-A, BH-B, and BH-C and during the initial round of sampling and analysis at well MW-1. All of these sample locations are near the former gasoline UST area (Plate 6). Subsequent quarterly sampling from well MW-1 did not duplicate concentrations of TPHg in excess of the non-drinking water screening criteria. While the concentrations of TPHg have diminished over time, the presence of TPHg in soil vapor (refer to Section 4.2.3) suggests that residual petroleum hydrocarbons associated with the UST are present in shallow groundwater and/or soils within the capillary fringe. Therefore, TPHg has been designated as a COPC in groundwater.

Medium- and Heavy-Fraction Petroleum Hydrocarbons: TPHd and TPHmo was detected in shallow groundwater appear to be related to a regional groundwater plume identified on the former Nielsen Trucking site located east and upgradient of the subject property and unrelated to former site activities. Despite the suspected off-site source of the medium- and heavy-fraction petroleum hydrocarbons in groundwater, TPHd and TPHmo have been selected as COPCs for shallow groundwater.

Benzene, Toluene, Ethylbenzene and Total Xylenes: As with TPHg, the highest concentrations of BTEX were found at sampling locations near the former UST and exceeded drinking water and non-drinking water criteria. Outside of the former UST area, benzene and

totally xylenes were found to consistently exceed only the drinking water criteria. BTEX has been designated as a COPC for shallow groundwater.

MTBE: MTBE was found at one location in the northwest corner of the site. This result appears to be isolated and unrelated to the former UST located in the opposite corner of the site. Therefore, MTBE is not considered a COPC although further characterization of the site for this constituent will be conducted to confirm its isolated and unrelated nature.

4.2.3 COPC Evaluation for Soil Vapor

Complete exposure pathways for soil vapor were determined for vapor intrusion into buildings. Screening criteria for soil vapor include comparison of soil vapor data to: (1) ESLs for Evaluation of Potential Vapor Intrusion Concerns, Residential Exposures (Residential Vapor Intrusion ESL; SFBRWQCB, 2008); and (2) U.S. EPA RSLs for ambient air (U.S. EPA, 2010). Chemicals in soil vapor that exceed one or more of the screening levels are shown graphically on Plate 7 and summarized in the table below:

Identified Constituent	Range of Detection	Frequency of Exceedence	Exceeded Regulatory Criteria
TPH (light-fraction C-5 to C-11)	2.2 to 830 $\mu\text{g/L}$	4/12	Residential Vapor Intrusion ESL (10 $\mu\text{g/L}$)
Benzene	0.13 to 5.5 $\mu\text{g/L}$	5/12	Residential Vapor Intrusion ESL (0.084 $\mu\text{g/L}$) RSL (0.00031 $\mu\text{g/L}$)
Toluene	0.1 to 1.1 $\mu\text{g/L}$	0/12	RSL (5.2 $\mu\text{g/L}$)
m,p-Xylenes	0.10 to 1.4 $\mu\text{g/L}$	5/12	RSL (0.104 $\mu\text{g/L}$)

Based on the results of the soil gas COPC evaluation, the following constituents were identified as COPCs:

Light-Fraction Petroleum Hydrocarbon: TPH in the C-5 to C-11 range was detected in all twelve soil vapor samples, of which four were above the respective residential and commercial ESLs for potential vapor intrusion. TPH is included as a COPC for soil vapor at the site.

Benzene, Toluene, Ethylbenzene, Xylenes: BTEX constituents were detected above the respective residential vapor intrusion ESL and/or RSL for ambient air in soil gas in various locations across the subject property. The presence of these constituents is likely the result of residual light-fraction petroleum hydrocarbons present on the site in vadose soils and shallow groundwater. BTEX are included as COPCs for soil vapor at the site.

4.3 Methane

Methane has been detected in soil vapor samples collected in the site vicinity at varying concentrations. In 2004, PES performed soil vapor sampling at the 6340 and 6390 Christie Avenue properties in Emeryville (PES, 2005c). Eight shallow soil vapor samples were collected outside the existing buildings at depths of approximately 2 to 3 feet bgs. Methane concentrations ranged from 0.2 to 85 percent.

The occurrence of methane in soil gas has been documented in the Emeryville area; however, the origin of the methane is unclear. As described previously, the site vicinity was a former tidal marsh, a depositional environment that is conducive to accumulation of organic-rich silts and clays related to the breakdown of marsh vegetation. Atmospheric oxygen is limited and dissolved oxygen is quickly depleted by bacteria as the organic materials decompose, resulting in anaerobic, or reducing, conditions. Ultimately, methanogenesis may occur, resulting in the production of naturally occurring methane as CO_2 is reduced to CH_4 (Richardson and Vepraskas, 2001). A similar process occurs with the breakdown of petroleum hydrocarbons in soil and groundwater, where anaerobic conditions prevail. Once sufficient reducing conditions are reached, methanogenesis results in the production of methane gas.

Based on the depositional environment for the site, the presence of petroleum hydrocarbons in groundwater, and the identification of methane during previous environmental investigations, there is a potential for continued generation of naturally-occurring methane in the subsurface at the site. However, in Emeryville methane considerations for new construction are under the jurisdiction of the City Fire Department as a fire safety issue. Mitigation of methane will be addressed during construction planning and design with the oversight of the City Building and Fire Departments, as appropriate. As such, methane is not a COPC for the site and not part of this remediation work plan.

5.0 REMEDIAL ACTION OBJECTIVES AND GOALS

The results of environmental investigations on the site and surrounding properties has identified or indicated the possible presence of COPCs in vadose soil and groundwater at the site. Remedial Action Objectives (RAOs) have been developed based upon the understanding of current environmental conditions and anticipated future uses of the site.

5.1 Removal Action Objectives

RAOs are statements of the general goals of the environmental cleanup and proposed site development and dictate appropriate response actions to address COPCs that could pose a significant threat to either public health or the environment. The RAOs for this remedial action include the following:

- Long-term protection of human health through the reduction or elimination of COPCs or elimination of potential exposure pathways;
- Cleaning up the site to facilitate construction of the planned residential building at the site without the need for institutional controls or long-term operations and maintenance (O & M) requirements; and
- Eliminate, through their removal, the potential for on-site sources of COPCs in soil to impact groundwater.

5.2 Remedial Goals

The proposed development use for the site as residential over a parking podium significantly decreases the likelihood that the site will be used for single-family or unrestricted residential purposes in the near or foreseeable future. However, in order to eliminate the need for institutional controls or long-term O & M obligations, remedial goals have been evaluated based on an unrestricted residential use scenario.

5.2.1 Remedial Goals for Vadose Zone Soils

It is anticipated that the majority of vadose zone soil will be removed during construction. Groundwater elevation conditions at the site will be confirmed during the pre-excavation investigation (refer to Section 6.1). If groundwater levels are lower at the time of site excavation and construction resulting in the presence of vadose-zone soil beneath the building footprint or if vadose-zone soil will remain on the building exterior beneath landscaping areas, then residential direct-exposure ESLs (refer to Section 4.1.1) will be used as the remedial goals (refer to Tables 1 and 2). Characterization of such vadose zone soils is described in Section 7.3. Construction worker exposure during site redevelopment is addressed in the health and safety plan (Appendix B).

5.2.2 Remedial Goals for Onsite Groundwater

As described in Section 2.2.1, groundwater extraction for beneficial use in the vicinity is currently prohibited by City ordinance. Nevertheless, the SFBRWQCB has set a long-term goal for restoring municipal beneficial uses to groundwater (SFBRWQCB, 1999). The COPCs in onsite groundwater that were identified at the site are petroleum hydrocarbons, including contribution from regional historical sources (refer to Section 3.5). Additional information regarding site groundwater conditions will be developed during the pre-excavation investigation (Section 6.1). It is expected that excavation of the site to depths ranging from 11 to 15 feet bgs, the top of the low-permeability native Bay Mud, will remove onsite sources of groundwater contamination (i.e., the vicinity of the UST) that might be present in fill materials. As such, there will be no further degradation of groundwater at or near the site from residual concentrations of organic COPCs. On the basis of the planned excavation and removal of potential onsite source(s) of contaminants to groundwater via soil, no specific remedial goals are proposed for groundwater at the site.

6.0 DESCRIPTION OF REMEDIATION PLAN

The proposed remediation plan to meet the cleanup objectives consists of:

- Pre-excavation investigation and waste characterization;
- Soil excavation for subgrade parking garage and mat foundation, soil segregation, and off-site reuse and/or disposal;
- Source removal of on-site sources of groundwater contamination, if any;
- Construction of an intrinsically-safe, podium-style building; and
- Water barrier of subgrade parking level.

Additional information regarding these elements is provided in the following sections.

6.1 Pre-Excavation Remedial Investigation and Waste Soil Characterization

Prior to implementation of the remediation, a pre-excavation remedial investigation will be conducted to collect additional chemical information needed to fully assess identified and suspected COPCs for the site and to fill identified data gaps, as discussed in Section 3.6. To meet these goals, the investigation will include the following components:

- Additional focused subsurface soil sampling in the vicinity of the former UST to evaluate for the lateral extent of residual light-fraction petroleum hydrocarbons;
- Soil sampling for *in situ* waste characterization purposes; and
- Installation and sampling of groundwater monitoring wells across the site to evaluate shallow groundwater conditions and gradient.

A work plan providing details regarding the above scope of work, will be prepared and submitted to the City of Emeryville for review and approval. Based on the result of this pre-excavation investigation, further investigation may be required to fully characterize the site.

Because the entire property will be excavated to depths ranging from 11 to 15 feet bgs, there is no area available to stockpile excavated soil for inspection, testing, and segregation for disposal purposes. As such, *in situ* soil samples will be used to characterize the waste for the purposes of evaluating waste segregation and disposal options, as well as sampling for landfill profiling requirements. Sample locations will be on a grid pattern across the excavation area, with soil samples collected at four depths of approximately 2, 5, 9, and 13 feet bgs. The number of samples and discrete sample depth per location will likely vary based on changes in the depth of excavation at each sample location, as described in the geotechnical report

(Rockridge, 2010). The waste characterization samples will be analyzed for constituents based on results from prior testing as well as any additional constituents required by disposal facility(s), and are expected to include at a minimum: TPH, VOCs, and the Title 22 list of heavy metals. A work plan describing details of the waste characterization sampling will be provided in the aforementioned pre-excavation site investigation work plan.

6.2 Soil Excavation, Segregation, and Disposal

The proposed soil excavation area has been identified based on the proposed development plans to construct a structure that incorporates a two-level, podium-style garage (i.e., one level below grade and one level at grade) upon which the residential upper floors will be built. Excavation will be performed using readily available construction equipment such as excavators, loaders, and dump trucks. Additional sources of contamination that are identified during the excavation will be removed to the extent practicable (e.g., localized materials in the bottom of the excavation). Prior to field activities, the analytical results for the pre-excavation investigation and in the *in situ* characterization will be evaluated and waste profiles submitted for approval to appropriate disposal facilities. The soil excavation will be performed in such a way as to segregate similar waste streams for disposal purposes. Details regarding the soil excavation process including permitting, health and safety, soil excavation and handling, dust and odor management, decontamination, and disposal are provided below in Section 7.0.

6.3 Source Removal of On-Site Sources of Groundwater Contamination

As described above, planned soil excavation will extend to and below the water table. As such, it is not anticipated that sources of contamination will remain that would have the potential to degrade groundwater quality beneath the site. Following excavation for the subgrade garage, additional localized excavation will be conducted, as needed, to remove contaminated soils that may be present in the saturated zone and that have the potential to continue to act as an on-site source of groundwater contamination. Selection of areas for additional excavation will be based on information derived from the pre-excavation investigation, observations during soil excavation, and the verification samples collected following the subgrade garage excavation activities, if any (refer to Section 7.3).

6.4 Intrinsically-Safe Podium-Style Design

Historical soil, groundwater, and soil gas analytical data indicate the presence of aromatic hydrocarbons beneath the site. Volatilization of this contamination and upward vertical migration results in the potential for indoor air intrusion. The planned development consists of commercial office and residential uses over ventilated parking levels. This construction design will significantly reduce or eliminate potential vapor intrusion concerns. This podium design is in conformance with the ASTM International Standard E 2600-08 for intrinsically-safe designs to mitigate for vapor intrusion.

6.5 Subgrade Water Barrier

As the project is designed, the lower level of the parking garage will extend below the observed water table at the site. Construction of a water-proofing barrier to prevent groundwater infiltration into the parking garage through the floor slab and subgrade walls will be required. There are several commercial barrier applications; the actual barrier design and construction will be determined upon evaluation of site-specific conditions, and in association with the project architect, the geotechnical engineer, and the general building contractor.

The water-proofing barrier will need to be suitable and chemically-compatible for use at the site with regard to, for example, residual petroleum constituents in groundwater (due to regional groundwater contamination) and potentially elevated salinity because of the bay fill and proximity to San Francisco Bay.

7.0 SOIL REMOVAL AND DISPOSAL IMPLEMENTATION

The anticipated excavation generally includes surface and subsurface fill and soils within and including the perimeter foundation of the subgrade garage level to a depth to accommodate a finished floor depth of approximately 10 feet below grade (Plate 8). Based on an estimated excavation depth of 11 to 15 feet bgs and a subgrade garage footprint of 48,450 square feet, it is estimated that approximately 19,800 to 26,900 bank cubic yards of material will be removed for construction of the mat foundation and subgrade garage level, and over-excavation of geotechnically-unsuitable fill. It is anticipated that the excavation, where extending below the top of the saturated zone, will require active management of groundwater through dewatering or installation of waterproof shoring.

7.1 Infrastructure, Permitting and Health & Safety Considerations

7.1.1 Utilities

PES and/or the general construction contractor will attempt to obtain as-built construction drawings of subsurface utilities from the property owner, the City building and engineering departments, PG&E, and other utility companies prior to implementing remediation. Prior to conducting the remediation, the remedial excavation contractor or general contractor will retain a private underground utility locating service to delineate subsurface utilities within and in the vicinity of the excavation area a minimum of three weeks in advance of planned excavation activities. If utilities necessary to ongoing functions of other areas of the site are identified within the excavation area, the remediation contractor will coordinate with the property owner or the property owner's representative to resolve utility relocation and to ensure that utility service to other areas is not disrupted. The remediation contractor will also be responsible for contacting USA to notify utility clients of the excavation work.

7.1.2 Permitting

The documentation needed for obtaining permits required to implement the remedial activities will be compiled. Approvals, permits, and licenses required by local, state, and federal agencies to complete the work will be obtained, and the work will be conducted in accordance with applicable federal, state, and local regulations. These include, but are not limited to:

- National Fire Protection Association (NFPA) 30, Flammable and Combustible Liquids;
- Occupational Safety and Health Administration (OSHA), 29 CFR 1910.120;
- Health and Safety Code, Division 20, Chapters 6.5 and 6.8;
- Title 8, California Code of Regulations (CCR), GISO 5192 Hazardous Materials Storage Ordinance, and Title 8 CCR 1532.1;
- California Code of Regulations, Title 8, Sections 1539-1543;
- Title 22, CCR Sections 66261.2 and 66261.3;
- Lead in Construction Interim Rule, Title 8 CCR, Section 1531;
- BAAQMD, Regulation 8, Organic Compounds, Rule 40, Aeration of Contaminated Soil and Removal of Underground Storage Tanks;
- Storm Water Pollution Prevention Plan; and
- City of Emeryville Grading Ordinance.

Anticipated permits and notifications include those related to excavation, soil stockpile management, on-site soil handling and loading, soil transportation and off-site landfill disposal, and backfilling and compaction activities.

7.1.3 Worker Health & Safety Plan

A site-specific Health and Safety Plan (HASP) has been prepared in accordance with applicable OSHA regulations for cleanup activities conducted by contractors and is included as Appendix B. The HASP provides information that addresses the health risks and hazards for each site task, employee training assignments to assure compliance with Title 8 of the California Code of Regulations, personal protective equipment, personnel monitoring, site control measures, decontamination procedures, and an Emergency Response Plan. The Emergency Response Plan addresses any reasonably foreseeable accident or upset conditions and outlines the procedures to be followed in the event of an emergency at the site. Emergencies that may occur at the site can include chemical spills, fires, explosions, and personal injuries. The HASP will be updated to address the findings of the pre-excavation investigation, as appropriate.

The remedial contractor, yet to be determined, will also be required to develop a HASP for its workers. The remedial contractor's HASP will be provided to the City of Emeryville for review and concurrence prior to implementation of the soil remedial activities.

7.1.4 Dust and Odor Management Plan

Depending upon the soil conditions, during excavation there is a potential to generate a nuisance dust condition and odors. A Dust and Odor Management Plan has been prepared for the site that describes "Basic Control Measures" for management of dust. The plan, attached to the RWP as Appendix C, also provides detailed procedures for monitoring of dust and odors during site grading activities.

7.1.5 Storm Water Pollution Prevention Plan

Because the proposed development will require grading of soils over an area in excess of 1 acre, a Storm Water Pollution Prevention Plan (SWPPP) is required for monitoring and mitigation of potential surface stormwater impacts during construction. Measures in the SWPPP will be implemented to prevent sediments and runoff from being carried into San Francisco Bay and storm drains. These measures may include: constructing soil stockpiles with plastic sheeting beneath (unless the ground surface is paved) and above the soil to prevent runoff, and grading of exposed soil such that positive drainage occurs and drainage into sanitary and storm water drain inlets does not occur.

A site-specific SWPPP will be prepared in accordance with the California Construction General Permit Order No. 2009-0009-DWQ by the general construction contractor or its designee as part of filing of the project's Notice of Intent (NOI) and prior to the initiation of site grading activities. The purpose and contents of the SWPPP will include the following:

- Identification of construction site risk determination;
- Identification of all pollutant sources including sources of sediment that may affect the quality of storm water discharges associated with remediation activities (storm water discharges) from the site;
- Identification and management of non-storm water discharges (including excavation dewatering if discharged to storm drains);
- Identification, construction and implementation in accordance with a time schedule, and maintenance of Best Management Practices (BMPs) to reduce or eliminate pollutants in storm water discharge and authorized non-storm water discharges from the site during remediation;
- Development of a maintenance schedule for permanent BMPs, if any, installed during remediation designed to reduce or eliminate pollutants after remediation is completed;

- Development of Rain Event Action Plans, as needed;
- Information on qualified personnel training; and
- Development of field monitoring and analysis programs, including sampling and analysis strategies and sampling schedule for discharges that may contain non-visible pollutants.

A copy of the SWPPP will be filed with the SFBRWQCB and the City of Emeryville upon completion.

7.2 Soil Excavation and Handling

The soil excavation portion of the remediation includes activities for development and environmental mitigation, loading, hauling, and off-site disposal. During these activities, Site work will include implementation of the HASP, Dust and Odor Monitoring Plan, Grading Plan, and SWPPP. The following summarizes these activities.

7.2.1 General Excavation Procedures

Proposed development at the site includes site-wide excavation to approximately 11 to 15 feet bgs to facilitate construction of below-grade parking areas. Soil excavated for the site-wide excavation will follow the appropriate waste soil characterization procedures described in Section 7.4.1

Due to shallow groundwater at the site (approximately 3 to 7 feet bgs), dewatering of the excavation once it reaches the water table will be required. Prior to commencing excavation activities, procedures and methodologies will be developed for de-watering and/or shoring by the general contractor or its designee. At this time, it is anticipated that dewatering will consist of extraction wells located adjacent to and within the excavation. The plan will contain directives and contingencies to implement the handling, storage, treatment (if needed), and disposal of potentially-contaminated groundwater removed from the excavation. The nature and levels of chemical constituents in the groundwater will be better understood after implementation of the pre-excavation investigation (refer to Section 6.1).

The removal of contaminated soil at the site will require excavations greater than 5 feet in depth. In order to ensure against the collapse of such excavations at the site, OSHA regulations (California Code of Regulations, Title 8, Sections 1539-1543) pertaining to excavations will be followed.

Soil excavation will be conducted using conventional earthmoving equipment (track- or tire-mounted excavators). Excavated soil will be classified as one of two material types: (1) potentially clean soil; or (2) metals-and/or petroleum hydrocarbon-affected soil. Excavated potentially clean soil may be temporarily stockpiled on-site for subsequent reuse, if appropriate.

Because of space limitations, it is anticipated that the majority of the excavated soils will not be stockpiled on-site, other than possible temporary stockpiles associated with daily soil staging. Most of the soil will likely be direct loaded into haul trucks for transport off the site. As shown on Plate 9, haul trucks will enter the site for loading, pass over a decontamination station and move to a final inspection station prior to leaving the property. The inspection will be made to verify that the waste soil is securely covered, to the extent practicable, and that the tires of the haul trucks are reasonably free of accumulated soil (see Section 7.2.3) prior to leaving the site. A street sweeper will be made available, as needed, to keep site access points and adjacent roadways clean. The soil will be wetted, as necessary, to reduce the potential for dust generation during loading and transportation activities. In accordance with the City noise ordinance, excavation activities will be conducted between the hours of 7:00 a.m. and 6:00 p.m., or as approved otherwise.

During excavation activities, a PES engineer or geologist will be present to observe the excavation of the metals and/or petroleum hydrocarbon-affected soil. Field screening techniques and soil analysis may be used to document metals and/or petroleum hydrocarbon concentrations during excavation. Soil may be screened for the presence of metals and/or petroleum hydrocarbons during excavation based on sensory evidence, such as soil discoloration and odors, and/or field screening with an organic vapor meter.

If buried prehistoric or historic cultural materials are encountered during remediation activities, work will be halted until a qualified archeologist can evaluate the nature and significance of the materials. In the event of discovery of geologic or paleontological resources, a qualified paleontological resource specialist or geologist will be contacted for immediate evaluation of the resources. If the geologic or paleontological resources are confirmed to be significant, the Office of Historic Preservation within the Department of California State Parks will be contacted for further guidance relating to documentation and preservation of the resource.

7.2.2 Soil Stockpiling

Due to space constraints, extensive soil stockpiling is not likely to occur during the soil excavation process as noted above. In the event that small quantities of waste soil are retained temporarily on site, soil stockpiles will be constructed with plastic sheeting beneath (unless the ground surface is paved) and above the soil to prevent runoff and fugitive dust and/or odor emissions. Stockpiled soil will be covered and secured at the end of each day. Stockpiles will be removed from the site after the remediation is completed.

7.2.3 Decontamination Procedures

Soil residue on equipment and excavator tracks/tires and truck tires will be removed using a combination of wet and dry methods. A decontamination station, as shown on Plate 9, will be constructed at the northwestern corner of the site. The station will consist of a bermed bed of crushed aggregate rock equipped with a water collection sump. During dry conditions, soil

residues will be removed by dry brushing. Soil that cannot be removed by this procedure will be removed from equipment by washing with high-pressure City-supplied water. During wet conditions, high-pressure water washing will be used to remove material residues and mud from equipment and tires. Water generated during decontamination activities will be contained for analysis and appropriate disposal/recycling. The work areas will be kept clean and free of excessive soil or debris.

7.3 Verification Sampling and Chemical Analysis Plan

As described in Section 5.2.1, if groundwater levels are lower than anticipated and vadose zone soil will remain beneath the building or along the exterior building perimeter, verification soil samples will be collected from the excavation areas. These samples will be used to evaluate whether the target remedial goals for area-specific metals, hydrocarbons, or VOCs in vadose zone soils have been met. Excavation bottom and sidewall samples will be collected as appropriate to confirm that excavation of affected soil has been accomplished to the lateral limits of the planned construction. In accordance with a City request, confirmation samples will be collected from the principal excavation area at the following frequency: (1) one sidewall sample for every 3 feet of depth and every 25 linear feet ; and (2) one bottom sample per 1,000 square feet. Sample locations and the number of samples collected may be adjusted in the field if necessary.

Soil samples will be submitted to a California-certified laboratory for chemical analysis using U.S. EPA Test Methods. The chemical analysis will include TPHg, TPHd, TPHmo, VOCs, and the Title 22 list of metals.

Verification sample analyses may be performed utilizing an expedited laboratory turn-around schedule in order to reduce the likelihood for significant delays to affect the remedial action schedule. Should laboratory analytical results indicate that the soil cleanup goals have not been attained, additional excavation will be performed to the extent practicable.

7.4 Waste Soil Classification and Management

7.4.1 Waste Soil Segregation and Classification

Where possible, waste soils will be segregated during excavation into discrete waste streams and handled in a manner appropriate for that material. Using data obtained during the pre-excavation investigation, appropriate landfills will be selected for the disposal of the excavated soil. Once the landfill site(s) are selected, the soil will be pre-profiled and any additional waste characterization testing will be performed as required by landfill waste acceptance requirements.

7.4.2 Soil Hauling and Off-Site Disposal

Contaminated soil will be transported to an appropriate disposal facility (Class 1, Class 2, or Class 3 landfill) by registered hazardous waste haulers in compliance with State and Federal requirements for the safe handling and transportation of hazardous waste.

Once landfill sites have been selected for the excavated soil, the Waste Transportation Plan (Appendix D) will be modified to include truck routes between the subject site and the disposal facility. This amended Waste Transportation Plan will be provided to the City of Emeryville for review and approval prior to the initiation of grading operations.

7.4.3 Manifesting Procedures

Following acceptance of the excavated soil at an appropriate disposal facility, the soil will be loaded in licensed haul trucks (end-dumps or transfer boxes) and transported off the site following appropriate California and Federal waste manifesting procedures. The appropriate waste manifest documentation will be provided to truck drivers hauling the affected soil off-site.

7.4.4 Waste Transportation and Haul Routes

The amended Waste Transportation Plan will provide specific details related to off-site transportation of waste soil (Appendix D). The Waste Transportation Plan also provides directions for approved haul routes through the City of Emeryville to the freeway and will include direction to the selected landfill destination(s).

7.5 Reporting

Following completion of soil excavation activities, a Remedial Action Implementation Report will be prepared. The report will summarize the work that was performed, verification soil sample analytical results, and the soil cleanup levels achieved. Copies of waste manifest forms, laboratory reports, and chain-of-custody forms will be included.

8.0 IMPLEMENTATION SCHEDULE

The implementation schedule for the RWP will include the following milestones:

- Final Conditional Approval of RWP by City of Emeryville: Feb. 2011
- Pre-Excavation Investigation and Waste Soil Characterization: Mar. 2011
- Site Demolition and Rough Grading: May – June 2011
- Soil Excavation/Disposal: July – Sept. 2011
- Construction of Foundations and Podium: Oct. – Feb. 2012

9.0 PUBLIC PARTICIPATION SUMMARY

The draft RWP was made available for public review and comment during the period December 29, 2010 through January 31, 2011. A public notice was placed in the Oakland Tribune on December 28, 2010 to announce the start and duration of the comment period, the locations of information repositories where the public could review project documents, and the date and location of a public meeting to discuss the RWP. In accordance with the City of Emeryville's public participation process, a fact sheet was prepared and distributed to residents and businesses within 300 feet of the site. The fact sheet provided a synopsis of the RWP and identified opportunities for public participation during the RWP approval proceedings. The public meeting was held on January 19, 2011 at the Emeryville City Hall.

No written comments were received during the public comment period. Several verbal comments were received and answered during the public meeting. The City of Emeryville has prepared a Responsiveness Summary for the public comment period, including a summary of topics discussed at the public meeting. Copies of the fact sheet, the notice in the newspaper, and the Responsiveness Summary are provided in Appendix E.

Notes:

█ = Concentration exceeding one or more screening criteria.

bgs = Below ground surface.

TPHd = Total petroleum hydrocarbons (TPH) quantified as diesel (U.S. EPA Test Method 8015M).

mg/kg = Milligrams per kilogram.

TPHmo = TPH quantified as motor oil (U.S. EPA Test Method 8015M).

TPHg = TPH quantified as gasoline (U.S. EPA Test Method 8260).

MTBE = Methyl tert-butyl ether (U.S. EPA Test Method 8260).

VOCs = Volatile organic compounds (U.S. EPA Test Method 8260).

PCBs = Polychlorinated biphenyls (U.S. EPA Test Method 8082).

-- = Not analyzed or not applicable.

Shaded area indicates a concentration exceeding one or more screening criterium.

<0.62 = Not detected at or above the indicated laboratory reporting limit.

All ND indicates chemicals not detected at or above respective reporting limits.

(1) Regional Water Quality Control Board (RWQCB) Environmental Screening Level (ESL): Direct Exposure for Residential Use (DERU); HQ = 1 for Non-Carcinogens (Table K-1).

(2) RWQCB Environmental Screening Level: Soil Leaching Level for Non-Drinking Water (Table G).

(3) RWQCB Environmental Screening Level: Soil Leaching Level for Drinking Water (Table G).

(4) California Environmental Protection Agency (CalEPA) Human Health Screening Level (CHHSL) for soil in a residential setting (CalEPA, 2005; Table 1).

(5) U.S. EPA Region 9 Regional Screening Levels (RSLs) for soil in a residential setting (May 2010). Lowest RSL for PCBs (Aroclor 1242, 1248, 1254,1260) is listed.

Var indicates various screening levels for individual chemicals.

PREVIOUS INVESTIGATION REPORTS (ON CD-ROM)

MEMORANDUM

To: Mr. Robert Wyatt -Allen Matkins Leck Gamble & Mallory, LLP

Cc: Ms. Denise Pinkston - TMG Partners

From: Will Mast and Peter Gorman - PES Environmental, Inc.

Project No.: 241.062.01.002

Date: January 21, 2005

Subject: Phase II Environmental Subsurface Investigation Results
Gold and Wolfman Properties, Emeryville, California

On December 15, 2004, PES conducted a subsurface investigation of the commercial properties located at 6340 and 6390 Christie Avenue in Emeryville, California (the Gold and Wolfman properties, respectively). This memorandum provides a brief description of the work performed, and presents the analytical results of the investigation. These data were previously discussed with Allen Matkins and TMG on January 7 and 11, 2005. We understand that further discussions with and review by the City of Emeryville will likely result in determining the final reporting format for these data.

Prior to the fieldwork, PES examined pre-existing environmental information, developed a sampling strategy, prepared a health and safety plan, obtained drilling permits from Alameda County, contacted Underground Service Alert, and performed utility clearance at sampling locations. Our drilling subcontractor advanced 7 borings to collect 7 groundwater samples and 12 depth-discrete soil samples. Additionally, soil gas samples were collected at 12 locations. These sampling locations are presented on Plate 1. The results of the laboratory analyses are summarized on Tables 1 through 6.

Please call (415) 899-1600 if you have any questions.

1.0 INTRODUCTION

1.1 Purpose and Scope of Work

This report presents the results of a Phase I Environmental Site Assessment (ESA) of the commercial building at 6340 Christie Avenue in Emeryville, California (Plate 1). PES Environmental, Inc. (PES) was retained by Allen Matkins Leck Gamble & Mallory, LLP (Allen Matkins) to evaluate the potential for onsite and/or offsite releases of hazardous materials to have affected the subject property. The investigation is being conducted in connection with legal advice being provided by Allen Matkins to TMG Partners (TMG), which is considering purchase of the property from the current owner, Mr. Richard Gold. PES understands that TMG's intended use of the property is to demolish the existing structure and redevelop it for mixed uses (e.g., commercial with residential on the upper floors).

The ESA was performed in general accordance with American Society for Testing and Materials (ASTM) guidelines for Phase I Environmental Site Assessments (ASTM E 1527-00), and the Service Agreement for the work (Reference No. 24106201S003). PES conducted the following tasks during the ESA:

- Reviewed Federal, State, and local agency databases to identify nearby sites which have reported the use, storage, or release of hazardous materials;
- Reviewed historical aerial photographs, City Directories, topographic maps and other historical sources for the subject property and surrounding area to evaluate prior land uses;
- Reviewed environmental reports describing previous environmental investigations on the subject property and in the site vicinity;
- Reviewed regulatory agency records for the site and nearby properties;
- Interviewed individuals with knowledge of the site;
- Conducted an inspection of the subject property and a reconnaissance of the surrounding area to provide an assessment of the potential for contamination of the subject property from onsite and/or offsite sources; and
- Prepared this report presenting the results of the Phase I ESA investigation.

1.2 Special Terms and Conditions

PES was not provided chain-of-title documentation. There are no special terms or conditions for this project.

1.3 Limitations

This Phase I Environmental Site Assessment was performed in accordance with practices and procedures generally accepted in the consulting engineering field at the time and place they were performed. Our professional judgment to assess the potential for contamination, including any identified herein, is based on limited data; no warranty is given or implied.

The Phase I Environmental Site Assessment was prepared at the request of Allen Matkins as part of the due diligence for acquisition of the property by TMG Partners or an affiliate, and may be relied on only by TMG, the TMG affiliates, if any, formed to acquire the property, and as identified in the Service Agreement.

2.0 SITE DESCRIPTION

2.1 Location

The subject property consists of an approximately 12,000 square-foot commercial building and associated paved parking area near the southeast corner of Christie Avenue and 64th Street in Emeryville, Alameda County, California (Plate 1). The site has the address of 6340 Christie Avenue. The site is bounded on the north by a small commercial office building, on the east and south by Emery Bay Marketplace and on the west by Christie Avenue. Access to the parking lot is from Christie Avenue.

2.2 Site and Vicinity Characteristics

The subject property covers approximately 0.6 acres and consists of a single-story commercial building and associated parking lot. The site is identified by Alameda County Assessor's Parcel Number 049-1492-008-00. The site is located in a former industrial area of Emeryville, which has been undergoing redevelopment for residential and commercial purposes since the mid-1980s.

2.3 Physical Setting

PES reviewed the Oakland West Quadrangle United States Geological Survey (USGS) 7.5-minute topographic map (1993) to evaluate the physical setting. According to the map, the subject property is situated at an elevation of approximately 10 feet above mean sea level, and the terrain slopes gently to the west-southwest. The nearest surface water body is San Francisco Bay, located approximately 500 feet west of the subject property.

2.4 Geology and Hydrogeology

Based on the results of investigations performed at the subject property and in the site vicinity, soils in the area consist primarily of clayey and silty sand fill material overlying native Bay

Mud. In the area north of 64th Avenue, previously used as the City of Emeryville's landfill (refer to Section 3.2.2), the fill material contains inert construction materials, including tarpaper, wood, plastic, glass, and rubber. These materials may also be present beneath the subject property. Fill thickness is estimated at approximately 3 to 15 feet in the site vicinity. The Bay Mud consists of clays and organic material. Depth to shallow groundwater in the site vicinity has been observed at approximately 4 to 12 feet below ground surface (bgs). During prior groundwater investigations performed at the site (see Section 3.3), the groundwater flow direction was observed to be southeasterly to southwesterly. However, based on topography and the results of groundwater investigations performed in the site vicinity, groundwater flow in the site vicinity is generally expected to be west-southwesterly.

The Federal Emergency Management Agency (FEMA) map for the subject property area shows the subject property is not within a 100- or 500-year year flood zone. According to the U.S. Fish and Wildlife 2002 National Wetlands Inventory, there are no wetlands present at the subject property or in the immediate vicinity.

2.5 Descriptions of Existing Onsite Structures and Improvements

2.5.1 Structures and Current Use

The subject property is developed with a single-story commercial building and associated parking area. Driveways off of Christie Avenue are present north and south of the building to access the parking area at the rear of the building. At the time of PES' site inspection, the building was vacant (refer to Section 4.0).

2.5.2 Other Improvements

Gas and electric service is provided to the subject property by Pacific Gas & Electric. Potable water and sanitary sewer services are provided by City of Emeryville.

2.6 Current Uses of Adjoining Properties

PES conducted a reconnaissance of the surrounding area to assess whether neighboring properties pose potential environmental concerns to the subject site. Adjacent land uses are identified on Plate 2. Adjacent properties are undeveloped or used for commercial purposes. The results of our surrounding area reconnaissance are presented below.

Property to the North

The subject property is bordered on the north by a commercial/office building. Further north are 64th Street and the Bay Center Apartments. Facilities historically present at the Bay Center site are listed on several environmental databases (refer to Section 3.3).

Property to the East

The subject property is bordered on the east by parking and a driveway on the Emery Bay Marketplace retail/office property (Marketplace). Beyond the driveway is a movie theater, which is also part of the Marketplace. Facilities historically present at the Emery Bay Marketplace site are listed on several environmental databases (refer to Section 3.3). Beyond the theater are Bay Street and railroad tracks.

Property to the South

The subject property is bordered to the south by another driveway and parking lot of the Marketplace commercial property.

Property to the West

The subject property is bordered to the west by Christie Avenue. Further west are vacant commercial buildings undergoing demolition and removal. According to City of Emeryville records, this area is scheduled for redevelopment, as discussed further in Section 3.3. Beyond lie U.S. Interstate 80 and San Francisco Bay.

2.7 Past Uses of the Property and Adjoining Properties

Historical site use information was obtained through a review of historical aerial photographs, Sanborn Fire Insurance Maps, City Directories, historical topographic maps, previous environmental reports, and an interview with the property owner.

2.7.1 Aerial Photograph Review

Aerial photographs from March 24, 1947; September 16, 1949; July 7, 1959; May 2, 1969; April 24, 1973; June 22, 1981; March 30, 1988; August 16, 1996; and August 24, 2003 were provided digitally by Pacific Aerial Surveys in Oakland, California. The results of the aerial photograph review are as follows:

The Subject Property

Photographs from 1947 and 1949 show the subject property as vacant land. Surficial grading or filling appears to be occurring in both photos. On the 1959 photograph, the western end of the subject property is in use as a paved parking lot. The lot appears to be associated with a commercial building present west of the subject property across Christie Avenue. Aerial photographs from 1969 through 2003 show the subject property building present as currently existing. On photographs from 1969 and 1973, the vacant area at the rear of the building appears to be unpaved. On the 1981 photograph, this area appears darkened, suggesting recent paving. Subsequent photographs show the area as paved.

Surrounding Properties

The 1947 aerial photograph shows commercial buildings south, east and north of the subject property. On the 1949 photograph, 64th Street appears to be under construction near the subject property, and grading activities are visible in the immediate vicinity. The surrounding area is primarily in commercial use. Four large aboveground storage tanks (ASTs) are present at a commercial facility east of the subject property, along the railroad tracks. Additional smaller ASTs are present further southeast of the subject property at a facility that shows evidence of significant staining over a large area. The area north of the subject property, across 64th Street, appears to be in use as an unpaved storage yard or landfill.

On the 1959 aerial photograph, a new commercial building is present west of the subject property across Christie Avenue, and the storage yard north of the subject property has been cleared and graded. On the 1969 photograph, a commercial building is present immediately north of the subject property, and the graded area further north of the site is in use as a paved truck yard with a commercial building, and the commercial buildings and four ASTs east of the site have been replaced with a commercial building and paved parking area. A commercial building is present immediately south of the subject property on previously undeveloped property, and additional commercial buildings are present to the west.

The 1973 photograph shows the presence of a new commercial building northeast of the subject property. A large darkened area is visible in the parking area of the commercial building immediately east of the subject property. No significant changes are visible on the 1981 photograph. On the 1988 photograph, the currently existing Bay Center Apartments have been constructed further north of the subject property, the currently existing office buildings and condominium tower are present northwest and southwest of the subject property, respectively, and the area east and further southeast of the subject property has been cleared and graded. On the 1996 photograph, Emery Bay Marketplace redevelopment project appears to have been completed east and southeast of the subject property.

2.7.2 Historical Sanborn Maps

Historical Sanborn Fire Insurance Maps from 1907, 1931, and 1952 were reviewed at Bancroft Library, University of California, Berkeley, California. Sanborn Fire Insurance Maps from 1967 and 1969 were obtained from EDR. The results of the Sanborn map review are as follows:

The Subject Property

Sanborn Maps from 1907 and 1931 indicate the subject property was part of San Francisco Bay. The 1952 Sanborn Map did not extend to the subject property. Sanborn maps from 1967 and 1969 show the subject property occupied by the currently existing building. The building is shown as an industrial machinery warehouse.

Surrounding Properties

Sanborn Maps from 1907 and 1931 show the area east of the subject property, adjacent to the historical San Francisco Bay line, occupied by LaCoste Fertilizer and Bone Works. Hog pens and slaughterhouses are shown northeast of the subject property. The 1952 Sanborn Map shows the area east of the subject property occupied by The Paraffine Companies. Four large and six smaller aboveground storage tanks are shown at the facility, in approximately the same locations as shown on the 1949 aerial photograph (refer to Section 2.7.1).

Surrounding property uses on the 1967 and 1969 Sanborn maps are shown as commercial or industrial. A motor freight and truck repair facility is shown immediately east of the subject property at the former location of The Paraffine Companies. West of the subject property, across Christie Avenue, is Emeryville Industrial Park, which includes a telephone company training center, hospital equipment warehouse, electronics service facility, electric sign service, and a vacant unit. Garrett Freightlines, Inc. is shown north of the subject property, across 64th Street, and Lacoste Meat Company and Farmer's Packing Company is shown to the northeast. The building immediately north of the subject property is occupied by a tool warehouse and photo lab. The area south of the subject property is shown as vacant. Railroad tracks are present east of the subject property adjacent to the meat company and motor freight/truck repair facility.

2.7.3 City Directories

Haines Criss-Cross City Directories from 1973 through 2003 were reviewed at the Oakland Public Library in Oakland, California. City Directories from 1973 and 1978 list Aerometrics, Continental Manufacturing, Double Seal Ring, Flomatics, Charles Lowe Company, Nevada Pump Line, William Nugent & Company, Reliance Water Columns, Sealol Chempro and Xomox Valve at the subject property address. City Directories from 1983 through 1996 list Lerer Brothers at the subject property address. Richard Gold is listed in the 2001 and 2003 City Directories. Listings for the surrounding properties were mixed commercial and residential.

2.7.4 Historical Topographic Maps

PES reviewed the Oakland West Quadrangle United States Geological Survey 7.5-minute topographic maps from 1980 and 1993. The 1980 map shows the subject property building and adjacent buildings to the north and west as currently existing. Commercial buildings that no longer exist are shown further north and east of the subject property. The 1993 map shows the subject property and vicinity in a developed urban area without building footprints shown.

2.7.5 Previous Historical Investigations

Numerous historical investigations were performed in the subject property vicinity during redevelopment activities in the 1980s (refer to Section 3.3). Based on a review of historical

topographic maps and other historical maps, the results of previous investigations (LFR, 2004; GTI, 1989; Woodward-Clyde, 1987) indicated that this area of Emeryville was formerly tidal flats. As Emeryville expanded from the late 1800s through at least the 1930s, the tidal lands were filled, primarily with imported soil and in certain areas, construction debris (wood, bricks, etc.).

2.7.6 Property Owner Interviews

PES interviewed Mr. Richard Gold, owner of the subject property, concerning historical use of the building. Mr. Gold indicated that the Gold family has owned the building since approximately 1979. Mr. Gold operated Lerer Brothers Transmission Service at the site from approximately 1980 through 1998, when business operations at the site were discontinued. Mr. Gold subsequently leased the building to a tenant who began interior and exterior building improvements, but never completed the work or occupied the site. The tenant improvements included building a mezzanine area, framing out office and hallway areas, and adding an exterior concrete pad intended for a solid waste container enclosure.

3.0 RECORDS REVIEW

3.1 Environmental Liens

Based on review of an environmental database search conducted by Environmental Data Resources, Inc. (EDR), there are no Federal Superfund (National Priority List [NPL]) liens or State deed restrictions associated with the subject property.

3.2 Standard Environmental Record Sources

The discussion presented in this section is based on available information provided by government agencies and various databases. An EDR report dated November 10, 2004 contains listings of sites located within a 1-mile radius, which were selected in accordance with ASTM E-1527-00 standards. This information is obtained from computerized databases of Federal, State, and local records. Descriptions of the lists reviewed and applicable search radii are presented below. The EDR database report is included as Appendix A.

The following regulatory agency databases were searched and reported in the EDR report:

- U.S. Environmental Protection Agency (EPA) – Comprehensive Environmental Response Compensation, and Liability Information System (CERCLIS) – within ½ mile of the subject property;
- U.S. EPA – CERCLA National Priority List (NPL) – within 1 mile of the subject property;

- California Department of Toxic Substances Control (DTSC) – Hazardous Waste Sites (CAL-SITES) – within 1 mile of the subject property;
- California State Water Resources Control Board (SWRCB) – LUST Incident Reports – within ½ mile of the subject property;
- California EPA/Office of Emergency Protection – Hazardous Waste and Substance Site List (CORTESE List) – within 1 mile of the subject property;
- U.S. EPA – Resource Conservation and Recovery Information System (RCRIS), Treatment, Storage, or Disposal (TSD) facilities (within ½ mile of the subject property) and Small Quantity and Large Quantity Generators of hazardous waste (SQG and LQG) databases – within ¼ mile of the subject property;
- Regional Water Quality Control Board (RWQCB) – Spills, Leaks, Investigation and Cleanups (SLIC) database – within ½ mile of the subject property;
- SWRCB – Hazardous Substance Storage Container Database (USTs) and California EPA Facility Inventory Database (FID) – within ¼ mile of the subject property;
- U.S. EPA – Emergency Response Notification System (ERNS) – the subject property;
- California Integrated Waste Management Board – Solid Waste Information System (SWIS) – within ½ mile of the subject property;
- California EPA Hazardous Waste Information System (HAZNET) – within ¼ mile of the subject property;
- U.S. EPA RCRA Corrective Action Report (CORRACTS) – within 1 mile of the subject property;
- U.S. EPA Facility Index System (FINDS) – the subject property; and
- U.S. EPA Toxic Chemical Release Inventory System (TRIS) – the subject property.

In addition, local, State and Federal supplemental regulatory databases were searched (e.g., AST, Coal Gasification Plants, and Waste Discharge System databases) and summarized in the EDR report. The findings of the review of the EDR report are presented below.

3.2.1 Subject Property Environmental Records

The subject property is listed on the LUST and HAZNET databases. In 1988, a 2,000-gallon gasoline underground storage tank (UST) was removed from the southeast corner of the site. No evidence of soil contamination was noted at the time of the UST removal and no samples were reportedly collected for analysis (ASE, 1998). Ten years thereafter, investigations were performed by Aqua Science Engineers (ASE) on behalf of Mr. Gold in October 1998. At that

time soil and grab groundwater samples were collected from five soil borings drilled at the site for laboratory analysis (ASE, 1998). A site map showing the tank excavation area and boring locations and tabulated data are presented in Appendix B. Samples were analyzed for total petroleum hydrocarbons quantified as gasoline (TPHg); benzene, toluene, ethylbenzene and xylenes (BTEX); and methyl tert-butyl ether (MTBE). The results indicated the presence of TPHg in soil at a boring near the former UST excavation at a concentration of 1,400 milligrams per kilogram (mg/kg) at a depth of approximately 6 feet bgs (ASE, 1998). Benzene was detected in two of the borings at a maximum concentration of 0.011 mg/kg. TPHg and benzene were detected in three groundwater samples at concentrations as high as 620,000 and 1,200 micrograms per liter ($\mu\text{g/L}$), respectively. MTBE was not detected in any of the soil or groundwater samples.

Three groundwater monitoring wells were subsequently installed at the site in 1999 (ASE, 1999a). TPHg and benzene were not detected above laboratory reporting limits in soil samples collected during well installation activities; however, lead was detected in samples collected from each boring at a depth of approximately 4.5 feet bgs at concentrations ranging from 49 to 130 mg/kg (Appendix B). The three wells were sampled approximately quarterly in 1999. TPHg and benzene were detected in the three wells at concentrations as high as 2,000 and 72 $\mu\text{g/L}$, respectively (ASE, 2000a). Lead and MTBE were not detected in any of the wells. ASE reported that the groundwater flow direction was southerly to southeasterly. In October 1999, grab groundwater samples were collected from two borings drilled at the adjacent Marketplace property south of the site to evaluate the lateral extent of petroleum hydrocarbons in groundwater (ASE, 1999b). Maps of soil borings and well locations, as well as tabulated data, are presented in Appendix B. TPHg was detected in groundwater collected from both borings at 65 and 180 $\mu\text{g/L}$, and benzene was detected in one boring at 1.2 $\mu\text{g/L}$. The three wells previously installed at the site were destroyed in May 2000 with ACDEH approval (ASE, 2000b). Case closure for the site is pending (ASE, 2003). A copy of the closure request is included in Appendix B. In an interview with PES, Mr. Gold reported that ACDEH indicated a deed restriction on the property would be required prior to issuing formal closure of the LUST case.

ACDEH records indicate that Lerer Brothers Transmission used motor oil, antifreeze, solvent and other typical truck repair chemicals, and generated waste oil, sludge and solvent. No violations were on file concerning hazardous material use or storage at the former Lerer Brothers Transmission facility. No information was available concerning hazardous material use at the site prior to Lerer Brothers Transmission's occupancy; however, as noted above, a gasoline UST was formerly present at the site.

3.2.2 Surrounding Area Property Environmental Records

Numerous properties in the site vicinity are listed on hazardous materials storage (e.g., FINDS and UST), hazardous waste generation (RCRIS-SQG), and hazardous materials release (e.g., LUST) databases. Details regarding Emery Bay Marketplace, Bay Center Apartments, and the Pinnacles Project are discussed below based on their proximity to the subject property and

environmental investigations conducted at these sites. Summaries of environmental investigations and conditions at the sites closest to the subject property are discussed below. The summaries are based on PES' review of documents at the above-listed regulatory agencies, and documents provided to PES by TMG.

The remaining sites listed on the hazardous materials release databases are not expected to present a significant environmental concern to the subject property based on one or more of the following: (1) the listed site is located down- or cross-gradient from the subject property with respect to the anticipated groundwater flow direction; (2) the release at the listed site is reported as having only affected soils; and/or (3) the listed site is located at too great a distance to represent an environmental condition with respect to the site.

Emery Bay Marketplace is located adjacent to the east and south sides of the subject property. The Marketplace covers approximately 7 acres extending south to approximately 59th Street. It is listed on the Cal-Sites, CORTESE, LUST, SLIC, and CERC-NFRAP databases. Beginning in the late 1800s, the central portion of the site area was occupied by the Paraffine Company (later named PABCO), which was involved in research and development of bituminous and petroleum-based products, asphalt refining, roof material manufacturing and paint manufacturing (Woodward-Clyde, 1987). Most PABCO operations were performed southeast of the subject property, but several structures were located east of the subject property along the railroad tracks, including four large ASTs. Several USTs were present southeast of the subject property, and reportedly contained solvent, crude asphalt, and other chemicals. A map showing the general PABCO site layout is provided in Appendix C. PABCO was purchased by Fiberboard in 1957. In the 1960s, operations at the site were discontinued, and many of the buildings were demolished by 1974.

The area immediately east of the subject property was developed as Nielsen Trucking in the 1960s. Nielsen operations included several diesel, gasoline, and waste oil USTs. Solvents, degreasers, motor oil, and other truck maintenance and repair chemicals were used at the Nielsen site. Operations at Nielsen ceased by the mid-1980s, and the Emery Bay Marketplace area was subsequently redeveloped beginning in the mid-1980s.

Soil and groundwater investigations were performed at the Marketplace beginning in the early 1980s. Soil investigations identified the presence of a subsurface tarry substance layer in the northeast portion of the site, and free-phase petroleum product was identified in groundwater monitoring wells (McLaren, 1989). At least 15 wells were installed to characterize groundwater quality. A map showing the well locations is included in Appendix C. During installation of a monitoring well (W6) adjacent to the eastern subject property boundary in 1987, layers of tarpaper, metal chips, and a strong tar odor were encountered (Woodard-Clyde, 1987). No petroleum hydrocarbons, volatile organic compounds (VOCs) or PCBs were detected in groundwater collected from this well; however, lead was detected at a concentration of 0.1 mg/L, which is above the U.S. EPA Drinking Water Action Level of 0.015 mg/L. This well appears to have since been destroyed and was not subsequently sampled.

Quarterly groundwater monitoring was performed at most of the Marketplace wells from approximately 1990 to 1996. Small amounts of separate-phase petroleum product have been frequently identified in a well (W-19) located approximately 120 feet northeast of the subject property. The results of October 1996 groundwater sampling and analysis indicated the presence of approximately 0.08 feet of product in this well. TPH quantified as diesel (TPHd) and as motor oil (TPHmo) were identified in this well at concentrations of 15 and 2.3 mg/L, respectively (PES, 1996). Concentrations of TPHd and TPHmo in groundwater generally increase to the southeast, away from the subject property, closer to the PABCO UST area. These data indicate that groundwater beneath the subject property may have been affected by the historical, offsite operations. A copy of the 1996 quarterly monitoring report is provided in Appendix D.

Bay Center Apartments are located north and northeast of the subject property across 64th Street. The listed site and its former occupants are listed on the CORTESE and SLIC databases. In the 1940s and 50s, portions of the site were used as a landfill by the City of Emeryville (LFR, 2004). From the 1950s until the mid-1980s, the site was used for trucking operations by Garrett Freight Company and Delta Truck Lines. Transo Envelope and LaCoste Meat Company formerly operated on the eastern portion of the site (HLA, 1992).

Twelve USTs were removed from the Bay Center Apartments site in the 1980s prior to construction of the existing Bay Center Apartments in the late 1980s and early 1990s. Subsequent soil and groundwater investigations identified the presence of petroleum hydrocarbons, including free-phase product, in soil and groundwater. Low levels of polynuclear aromatics (PNAs), pesticides, and PCBs were also identified in groundwater (GTI, 1989). A separate-phase hydrocarbon extraction system operated from 1990 to 1991, at which time the operation of the system was discontinued.

Wells at the site were again sampled in 2004 (PES, 2004). The results of groundwater analysis indicated that free-phase remained in three wells at the site, located over 500 feet north of the subject property. Free-phase product is currently manually removed from onsite wells. In the well closest to the subject property (Well MW-3), located approximately 150 feet to the north, TPHd and TPHmo were detected at concentrations up to 3,400 and 3,900 $\mu\text{g/L}$, respectively, in March 2004. During installation of this well in 1989, free-phase product was encountered in soil (GTI, 1989). In 1989, radial groundwater flow, to the northeast in the vicinity of the subject property, was measured. However, groundwater monitoring in 2004 indicated a southwesterly groundwater flow. As a result, because this site is located cross-gradient of the subject property, groundwater contamination associated with USTs formerly present at the site is not expected to pose a significant environmental concern to the subject property.

Low levels of methane gas were detected in soil at the Bay Center site (GSF, 1987). GSF did not identify methane emissions at the ground surface, but recommended ventilation of elevator shafts and other subsurface areas. Passive methane gas venting systems have been installed in elevator shafts at the Bay Center site. The source of the methane gas is likely from natural

degradation of organic materials in subsurface Bay Mud, and/or decomposition of organic materials in the fill.

The Pinnacle Project consists of three parcels located west of the subject property across Christie Avenue, and cross- to downgradient with respect to anticipated southwesterly groundwater flow. According to City of Emeryville Planning Department records, the Pinnacle site is planned for redevelopment with a 224-unit apartment building constructed over ground-level parking. During the period of performing this ESA, four vacant commercial buildings historically used for warehousing, offices, and other light industrial businesses were demolished and removed. The site was previously beneath San Francisco Bay and was filled in the 1940s. A 1,000-gallon underground storage tank (UST) was removed from one of the parcels in 1991.

Environmental investigations performed at the Pinnacle site have included the collection of soil and groundwater samples; the samples were analyzed for the presence of TPHg/d/mo, BTEX, VOCs, PCBs, and metals (EFI, 2004). The results of analysis indicated the presence of elevated concentrations of TPHd, TPHmo, antimony, arsenic, cadmium, chromium, copper, lead and zinc in soil. In addition, TPHd, TPHmo, VOCs (including benzene, MTBE, and chloroform), and metals were detected in groundwater samples. EFI stated that the chemicals detected in groundwater were indicative of regional groundwater contamination, and as such, did not require further assessment or treatment. The City of Emeryville concurred with EFI's determination with regard to groundwater conditions (Emeryville, 2004).

During the soil and groundwater investigations, elevated photo-ionization detector (PID) readings were measured which were attributed to methane gas that is known to be present in the vicinity. A remedial plan has been developed for the site (EFI, 2004), which includes excavation and offsite disposal of contaminated soil. No action is planned to address the identified regional groundwater contamination. A methane gas investigation is planned following soil removal activities. Because this site is located cross- to downgradient of the subject property with respect to groundwater flow, environmental conditions at the Pinnacle site are not expected to pose a significant environmental concern to the subject property. However, the general nature of contaminants identified at the Pinnacle site are likely typical of contaminants present in historical fill materials in the site vicinity.

4.0 SITE INSPECTION

PES personnel inspected the subject property on November 22, 2004 to assess the potential for environmental concerns related to the use or storage of hazardous materials at the subject site or surrounding properties. Observations from PES' site visit are discussed in the following sections. Photographs taken during the site inspection are included as Plates 3 through 4.

The subject property consists of a single-story commercial building and associated parking area covering approximately 0.6 acres near the southeast corner of Christie Avenue and 64th Street

in Emeryville, Alameda County, California. The site is bounded on the north by a commercial/office building, on the east and south by Emery Bay Marketplace, and on the west by Christie Avenue.

At the time of PES' site inspection, the building was vacant. The interior of the building was bare concrete floor. PES observed partially completed tenant improvements (refer to Section 2.7.6) consisting of interior walls, which had been framed but not drywalled, and a mezzanine area in the western portion of the building. Concrete in the rear of the building showed evidence of wear and pitting, but no significant staining was observed. On the ground floor beneath the mezzanine, an approximately 2-foot square of the concrete floor had been saw cut and removed, apparently to install electrical lines.

The north, east, and south exterior of the property are covered with asphaltic pavement. The pavement of the parking and driveway areas is in good condition, with no significant staining. A narrow landscaping area forms the border between the subject property and the Marketplace to the east and south.

4.1 Chemicals/Hazardous Substances Containers

No indications of current chemical use and/or storage were identified during PES' site inspection.

4.2 Storage Tanks

A UST was removed from the subject property in 1988, as discussed in Section 3.3. No indication of other existing onsite ASTs or USTs was identified during PES' regulatory agency file reviews and site inspection.

4.3 Indications of PCBs

No electrical transformers or other indications of PCB use were observed on the subject property.

4.4 Solid Waste Disposal

No solid waste is currently generated at the subject property.

4.5 Other Conditions of Concern

4.5.1 Asbestos Issues

Based on the age of the building, asbestos may be present within building materials. However, because the building is concrete tilt-up construction and the building interior has been gutted, with the only improvements generally consisting of unfinished wood framing, the presence of

asbestos, if any, may likely be limited to roofing materials. A comprehensive asbestos survey of the building is recommended prior to any renovation or demolition activities so that asbestos, if present, can be properly managed.

4.5.2 Lead-Based Paint Issues

Based on the non-residential use of the building, lead-based paint (LBP) is not considered an environmental concern. Nevertheless, a LBP survey is recommended prior to significant exterior renovation or demolition activities so that LBP, if present, can be properly managed.

4.5.3 Radon Issues

The California Department of Health Services participated in the U.S. EPA's State Radon Survey, which was conducted in 1990 to assess indoor radon levels in single-family homes. As part of the survey, homes in the subject property area were sampled for the presence of radon. The median value for radon levels was reported to be 0.776 pico curies per liter (pCi/l) of air for first floor living areas. This is significantly lower than the U.S. EPA's recommended action level of 4.0 pCi/l.

The State's survey indicates it is unlikely that radon levels in residences (or other above ground structures) in Emeryville are above the action level, and therefore, no radon testing was deemed necessary for this project.

5.0 FINDINGS AND CONCLUSIONS

The subject property consists of an approximately 12,000 square-foot commercial building and associated paved parking area near the southeast corner of Christie Avenue and 64th Street in Emeryville, Alameda County, California. The site has the address of 6340 Christie Avenue. The site is bounded on the north by a commercial building, on the east and south by Emery Bay Marketplace, and on the west by Christie Avenue. Access to the building parking lot is from Christie Avenue. The site is located in an area of Emeryville that is currently used for residential and commercial purposes.

The results of PES' historical research indicate that the site was originally beneath the San Francisco Bay or within tidal flats. This vicinity of Emeryville was filled, primarily with inert construction fill materials, in the 1940s. The subject property was undeveloped until a paved parking was observed on the western end of the subject property in the late 1950s. The subject property building was constructed in 1966, and has been used for commercial purposes. A transmission repair service operated at the subject property from 1980 to 1998, and typical automotive repair and maintenance chemicals were used at the site. No information was available concerning hazardous material use at the subject property prior to the transmission service operations, although a gasoline UST was historically present at the site.

The gasoline UST was removed from the southeastern corner of the subject property in 1988. Soil and groundwater investigations were subsequently performed in 1998 and 1999. Results of analysis of groundwater samples collected from the site identified maximum concentrations of TPHg and benzene of 2,000 and 72 $\mu\text{g/L}$, respectively. Three monitoring wells installed at the site were destroyed in May 2000 with ACDEH approval. A case closure request for the on-site LUST case is pending. The property owner reported that ACDEH indicated a deed restriction on the property would be required prior to issuance of LUST case closure. The former presence of the UST at the subject property and the open ACDEH case constitutes a recognized environmental condition.

PES' review of local, State, and Federal regulatory agency databases revealed several documented hazardous material release sites located in the study area. Based on: (1) the extensive historical industrial uses of the site vicinity, and (2) the documented hydrocarbon contamination in groundwater surrounding the subject property at Bay Center Apartments, Emery Bay Marketplace, and the Pinnacle Project, it is likely that groundwater quality beneath the subject property has similar characteristics. Additionally, methane gas has been detected at several sites in the subject property vicinity, and may be related to biodegradation of organic material in Bay Muds and/or fill beneath the site. Several other sites listed on hazardous material release databases are not expected to present a significant environmental concern to the subject property based on one or more of the following: (1) the site is located down- or cross-gradient from the subject property with respect to the groundwater flow direction; (2) the release at the site is reported as having only affected soils; (3) the release at the site has been investigated and remediated under regulatory oversight; and/or (4) the site is situated at a distance too great to present a significant environmental concern.

The building at the subject site is currently unoccupied. No current hazardous material use was observed at the subject property during PES' site inspection.

The following noteworthy observations were identified on the subject property during the Phase I ESA research and site inspection:

- With the exception of the gasoline UST removed in 1988, no information concerning hazardous materials use and storage at the facility prior to Lerer Brothers Transmission was identified during this ESA;
- Elevated concentrations of petroleum hydrocarbons and metals have been identified in soil in the site vicinity that appears to be associated with historical fill materials; and
- Methane in soil gas has been detected in the subject property vicinity that appears to originate from subsurface Bay Muds and/or fill present in this area of Emeryville.

The following historical and current recognized environmental conditions were identified:

- The subject property is listed on the LUST database as a result of the historical UST present at the site. Residual groundwater contamination was identified at the site; and

- Petroleum hydrocarbon contamination has been identified on adjacent and nearby properties.

PES makes the following recommendations:

- A Phase II investigation should be performed to evaluate: (1) soil and groundwater quality beneath the site in the vicinity of the transmission service area to assess the potential for releases of chemicals to have affected these media; (2) groundwater conditions that might result from offsite, upgradient sources; and (3) the potential presence of methane gas in soil beneath the site;
- Case closure for the former UST at the site should be obtained from ACDEH; and
- Comprehensive asbestos and lead-based paint surveys should be performed prior to significant renovation or demolition activities.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

CERCLIS-NFRAP: As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund Action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

A review of the CERC-NFRAP list, as provided by EDR, and dated 08/10/2004 has revealed that there is 1 CERC-NFRAP site within approximately 0.25 miles of the target property.

 EMERYVILLE, CA 94608

Background Info : The Transo/Lacoste Site was the former location of the Transo Envelope Company (Transo) and the Lacoste Meat Company (Lacoste). Transo occupied 1600 64th Street and was an envelope manufacturing facility in the early 1900's. Lacoste occupied 6401 Bay Street and was a slaughter house and meat packing facility in the early 1900's. The City of Emeryville purchased both properties in 1990 as part of the Bay Street-Shellmound Street Extension Project. Both facilities were located at the corner of 64th Street and Bay Street in Emeryville. The two buildings were demolished in February and March 1990 by the City of Emeryville Redevelopment Agency. The City redeveloped the Site as the EmeryBay II Apartments. Groundwater underneath the Site was discovered to be contaminated by lead, oil and grease in June 1991. Groundwater monitoring took place and a passive soil venting system was installed beneath the concrete parking garage slab of EmeryBay II.

Background Info :	<p>The site was construction of a new city street utilizing existing segments of Shellmound Street and a new overhead bridge structure in the City of Emeryville.</p> <p>Not reported</p> <p>The 40th Street overhead bridge construction required excavation of contaminated soils in 1995. Approximately 300 cubic yards of soils were excavated and disposed off-site. The remaining 5,700 cubic yards were encapsulated within an 18-inch thick clay blanket within the embankment and an additional 2 to 5 feet of clean fill was placed on top.</p> <p>Not reported</p> <p>Phase II of Shellmound project covered the construction of a surface street. Soil was contaminated with metals, PCBs petroleum hydrocarbons, and volatile and semi-volatile organics. About 8000 cubic yards of soil were excavated and treated on-site with dry reagents and an asphaltic emulsion mixture on-site. The treated soil was used as roadway. Approximately, 113,000 gallons of groundwater were collected, treated and disposed to the sanitary sewer. This removal took place in 1996.</p> <p>Not reported</p> <p>A deed restriction was recorded on June 28, 1996 limiting use of street and prohibits soil disturbance without an approved Soil Management Plan.</p>

Address(es) : 4300 EASTSHORE HIGHWAY
 EMERYVILLE, CA 94560

Background Info : The site was a former steel manufacturing plant which was operated over 100 years by Judson Steel and Barbary Coast Steel Corporation. These operations resulted in the contamination of the soil and groundwater with metals, total petroleum hydrocarbons (TPH), and PCBs.
 Not reported
 Caltrans took ownership of a strip of the property as part of the overall new highway construction related to the Cypress project. Caltrans and East Bay Municipal Utility District relocated a major sewerline and constructed a new concrete double box culvert. The construction of these two structures required excavation through contaminated soils.
 Not reported
 Soils with lead over 5,000 ppm or TPH over 1,000 ppm were hauled off for proper disposal off-site. Lower level contaminated soil was used as backfill material and was covered over with two feet of clean soil. Any groundwater encountered was treated and disposed by sewer. Groundwater remediation is covered under the Barbary Coast remediation.

 Background Info : The site is a roadway construction project undertaken by the City of Emeryville. A new city street was constructed from 64th Street to Shellmound Street. This area was formerly a tideland and marshland. Random filling with soil mixed with industrial wastes and various debris took place historically. Sampling results revealed the presence of petroleum hydrocarbons, metals, PCBs and polycyclic aromatic hydrocarbons. Contaminated soil was excavated and disposed off-site. The completed roadway acts as a cap to prevent exposure to residual levels of contaminated soil. A deed restriction was recorded limiting future use to roadway.

BEP:

Site Description : This site is a two acre, undeveloped and vacant area lying directly west of the Westinghouse Electric Company facility. Operations at this facility included maintenance and repair of electrical apparatus, including transformers containing polychlorinated biphenyls (PCB) fluids. In the course of maintenance, some of these liquids leaked on, or were discharged to the site.

Hazardous Waste Desc : The principal contaminant on the site is PCB.

Threat To Public Health & Env : The concerns for human health are primarily those of direct contact. The Westinghouse site is in an industrial area and, subsequent to the findings of PCB contamination, was fenced to exclude trespassers. A mainline, fenced, railroad right of way also secures the site from trespassers. Offsite contamination at an adjacent property has been identified by DHS sampling. The extent of offsite contamination has not been defined.

Site Activity Status : EPA assumed the lead responsibility in April, 1981 for the characterization of the site and the development and implementation of a remedial action for the site with advisory roles by DHS and the RWQCB. The remediation consisted of containment of soil and ground water contamination by means of an "engineered cap" and a slurry wall. The RWQCB issued cleanup and abatement order No. 85-006, dated January 21, 1985, pertaining to the prevention of soil movement from the site by surface water runoff control. Additional remedial investigation is currently ongoing because PCB contamination was discovered in a building onsite and along a railroad spur track between Westinghouse and an adjacent property. DHS has not scheduled this site for activity at this time. Any DHS assistance is expected to be limited. If more extensive assistance by DHS is necessary, then advance funding will need to be secured.

Project Revenue Source Co. : Not Reported
 PRS Company Address : Not reported
 Not reported

Project Revenue Source Desc : This site is projected for cleanup funded by responsible parties with reimbursement to DHS for staff and related costs. However, if the responsible parties fail to provide funding for cleanup another source of funds will need to be established.

Responsible Party : BACKLOG SITE CLEANUP PLANNING REPORT

FORMER INDUSTRIAL HARD CHROME (Continued)

S105557579

Background Info : Site was occupied by a hard chrome plating company from 1948 to 1962. Hazardous waste generated at the site included chromic and sulfuric acid solutions with heavy metals. Latham Engineering is reported to have managed the wastes. The facility used a waste chrome recovery system and a neutralization system. Storage and disposal methods are not known. In 1958, a reported spill occurred on the property where contamination entered the storm drain and resulted in low pH levels in the City's sewer effluent water. The quantity and extent of spill is not known.

Agency Type: Not reported
 Waste Type: Not reported
 Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
 Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
 Reclamation: Not reported
 POTW: Not reported

Gallons Of Liquid Removed Upon Completion : Not reported
 Cubic Yards Of Solids Treated Upon Completion : Not reported
 Actvty Deleted Via Commitmnt/Completns Screen : Not reported
 Special Program Code: CERC2
 Special Program : CERCLA II
 Comments Date : 01011992
 Comments : DTSC needs to determine current site status.
 Site Screening Done: Two 5000-gallon diesel tanks and a waste oil tank removed by 11/20/86. Another 5000-gallon tank was removed in the '70s. Removal of 2600 cubic yards of soil. On site soil undergoing aerobic degradation. Recommend Preliminary Assessment due to need for information on ground water contamination.
 Preliminary Assessment Done: Eight underground tanks removed. One diesel and one waste oil tank had leaked. Gas tank spill had occurred in the '70s. On-site aeration of 7000 cubic yards of soil. Shopping mall built on site. Additional contamination found in the southern part of the site. Hazardous waste contamination is migrating. Preliminary Assessment submitted to EPA. NFA under CERCLA2. This Site is under Alameda County Health Dept. oversight. Because groundwater TPH plume is flowing off-site onto the Shellmound Ventures Property, DTSC is reviewing clean-up proposals.
 Self-Monitoring: Eight soil borings drilled to determine quantity and extent of diesel and other petroleum products in soil and groundwater. RWQCB is the lead agency.
 Self-Monitoring: Soil borings converted to monitoring wells.
 Sample Results: Five borings showed total fuel hydrocarbons greater than 1000 ppm (reported 08/11/86).

BEP:
 Site Description : This site, which has been in operation since the early 1920s, is a Pacific Gas and Electric's Materials Distribution Center. The site has served as a warehouse, repair shop and storage yard for transformers, capacitors and other electrical supplies. A tank farm for the storage of fuel and transformer oil is also present on the site. The facility covers approximately two city blocks of an area which is generally industrialized.
 Hazardous Waste Desc : The soil is contaminated with polychlorinated biphenyls (PCBs) and lead, which is present at very high concentrations in localized areas. The ground water is contaminated with heavy metals that may have originated from the site.
 Threat To Public Health & Env : Direct contact with soil is unlikely; the site is completely fenced. Two ground water wells present on the site have been abandoned. There is no known use of the ground water for drinking water supply or for industrial uses.
 Site Activity Status : More PCB contamination has been found as the result of recent soil sampling. PG&E plans to modify their removal action plan, accordingly. If the cleanup costs are less than \$250,000, DHS will exempt the site from the formal RAP requirements.
 Project Revenue Source Co. : Not Reported
 PRS Company Address : Not reported
 Project Revenue Source Desc : DHS will be issuing a remedial action order or entering into an enforceable agreement with the responsible parties. DHS has budgeted \$50,000 for oversight/monitoring of cleanup efforts. DHS will recover 100 percent of

Site Description : This site is plating facility which previously disposed of chromium waste to shallow wells onsite.

Hazardous Waste Desc : Hexavalent chromium has been detected in the subsurface soil and the ground water.

Threat To Public Health & Env : This is a small site and the public health threat posed by the site is believed to be minimal. The site, which is located in an industrial area, is paved and has restricted access. There is salt water intrusion in the area and ground water is not used for drinking.

Site Activity Status : Phase I soil and ground water sampling has been completed. Phase II sampling has not been initiated because the company declared bankruptcy. This site has been placed in the backlog due to the relatively low public health/environmental hazard.

Project Revenue Source Co. : Not Reported

PRS Company Address : Not reported

Project Revenue Source Desc : This site is projected to be remediated by the responsible parties with reimbursement to DHS for its oversight and monitoring costs. However, if the responsible parties are unable to fund the remediation activities, another source of funds will need to be identified.

EPA ID Number

S100833503

Department revealed no groundwater use which would result in significant human exposure.
RWQCB INVESTIGATING SITE
NOTICE AND ORDER CAO - RWQCB.
Site is a plating facility which previously disposed of chromium waste to shallow wells onsite. Hexavalent chromium has been detected in the subsurface soil and the groundwater. Site is paved and has restricted access.
INSPECTION(STATE) GROUNDWATER CONTAMINATION: CHROMIC ACID
INSPECTION(OTHER) E&E REP C(84)C400 ON SI. RWQCB ISSUED CAO 77-001 REQ CO QUIT CHROMIC ACID DISCH. RWQCB SUPRV REMEDIAL ACTIONS.
ENFORCEMENT(OTHER) RWQCB TAKING LEAD ON SITE
SFRWQCB says County preenforcement panel meeting held and the facility is on track to defining the problem. The site is being handled by the County but will be picked up by the Water Board when the problem is defined.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List

Source: EPA

Telephone: N/A

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/30/04

Date Made Active at EDR: 09/09/04

Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 08/03/04

Elapsed ASTM days: 37

Date of Last EDR Contact: 11/02/04

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

Source: EPA

Telephone: 703-413-0223

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 08/10/04

Date Made Active at EDR: 10/27/04

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Source: EPA

Telephone: 703-413-0223

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

RCRIS: Resource Conservation and Recovery Information System

Source: EPA
Telephone: 800-424-9346

Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

DOD: Department of Defense Sites

Source: USGS
Telephone: 703-692-8801

This data set consists of federally owned or administered lands, administered by the Department of Defense, that have any area equal to or greater than 640 acres of the United States, Puerto Rico, and the U.S. Virgin Islands.

Date of Government Version: 10/01/03
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 08/12/04
Date of Next Scheduled EDR Contact: 11/08/04

UMTRA: Uranium Mill Tailings Sites

Source: Department of Energy
Telephone: 505-845-0011

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

RAATS: RCRA Administrative Action Tracking System

Source: EPA
Telephone: 202-564-4104

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 09/07/04
Date of Next Scheduled EDR Contact: 12/06/04

TRIS: Toxic Chemical Release Inventory System

Source: EPA
Telephone: 202-566-0250

Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/02
Database Release Frequency: Annually

Date of Last EDR Contact: 09/20/04
Date of Next Scheduled EDR Contact: 12/20/04

TSCA: Toxic Substances Control Act

Source: EPA
Telephone: 202-260-5521

Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/02
Database Release Frequency: Every 4 Years

Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/21/04

Date of Next Scheduled EDR Contact: 12/20/04

DEED: List of Deed Restrictions

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

The use of recorded land use restrictions is one of the methods the DTSC uses to protect the public from unsafe exposures to hazardous substances and wastes.

Date of Government Version: 10/04/04

Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 10/04/04

Date of Next Scheduled EDR Contact: 01/03/05

NFA: No Further Action Determination

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

This category contains properties at which DTSC has made a clear determination that the property does not pose a problem to the environment or to public health.

Date of Government Version: 06/01/04

Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/16/04

Date of Next Scheduled EDR Contact: 11/29/04

EMI: Emissions Inventory Data

Source: California Air Resources Board

Telephone: 916-322-2990

Toxics and criteria pollutant emissions data collected by the ARB and local air pollution agencies.

Date of Government Version: 12/31/02

Database Release Frequency: Varies

Date of Last EDR Contact: 10/22/04

Date of Next Scheduled EDR Contact: 01/17/05

REF: Unconfirmed Properties Referred to Another Agency

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

This category contains properties where contamination has not been confirmed and which were determined as not requiring direct DTSC Site Mitigation Program action or oversight. Accordingly, these sites have been referred to another state or local regulatory agency.

HAZNET: Facility and Manifest Data

Source: California Environmental Protection Agency
Telephone: 916-255-1136

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

US BROWNFIELDS: A Listing of Brownfields Sites

Source: Environmental Protection Agency

Telephone: 202-566-2777

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Next Scheduled EDR Contact: N/A

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: PennWell Corporation

Telephone: (800) 823-6277

This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

GEOCHECK[®] - PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

6340-6390 CHRISTIE AVE.
6340-6390 CHRISTIE AVE.
EMERYVILLE, CA 94608

TARGET PROPERTY COORDINATES

Latitude (North):	37.843498 - 37° 50' 36.6"
Longitude (West):	122.295502 - 122° 17' 43.8"
Universal Transverse Mercator:	Zone 10
UTM X (Meters):	561986.4
UTM Y (Meters):	4188479.8
Elevation:	11 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map: 37122-G3 OAKLAND WEST, CA
General Topographic Gradient: General WSW
Source: USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> ALAMEDA, CA	FEMA Flood <u>Electronic Data</u> YES - refer to the Overview Map and Detail Map

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u> OAKLAND WEST	NWI Electronic <u>Data Coverage</u> YES - refer to the Overview Map and Detail Map
--	--

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data:*

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Cenozoic
 System: Quaternary
 Series: Quaternary
 Code: Q (decoded above as Era, System & Series)

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: sand
loamy sand
silty clay loam

Surficial Soil Types: sand
loamy sand
silty clay loam

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: sand
fine sand
stratified

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

1.0 INTRODUCTION

This report presents the methods and findings of Aqua Science Engineers, Inc. (ASE)'s soil and groundwater assessment at the Lerer Brothers Transmission Service property located at 6340 Christie Avenue in Emeryville, California (Figure 1). The site assessment activities were initiated by Mr. Rick Gold of Lerer Brothers Transmission Service to delineate the area of petroleum hydrocarbon contamination in soil and groundwater in the vicinity of the former underground storage tank (UST) in order to achieve case closure.

2.0 SITE HISTORY

One 2,000 gallon steel UST used to store unleaded gasoline was removed from the site in 1988. No verifiable records have been located regarding the UST removal.

3.0 SCOPE OF WORK (SOW)

Based on the site history and requirements of the Alameda County Health Care Services Agency (ACHCSA), ASE's scope of work was to:

- 1) Prepare a workplan for approval by the ACHCSA.
- 2) Obtain a drilling permit from the Alameda County Public Works Agency (ACPWA).
- 3) Drill five (5) soil borings at the site with a Geoprobe drill rig. Collect soil and groundwater samples from each boring.
- 4) Analyze one soil and one groundwater sample from each boring at a CAL-EPA certified analytical laboratory for TPH-G by modified EPA Method 5030/8015 and benzene, toluene, ethylbenzene and total xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by EPA Method 8020.
- 5) Backfill the borings with neat cement.
- 6) Prepare a report outlining the methods and findings of this assessment.

4.0 DRILL SOIL BORINGS AND COLLECT SAMPLES

Prior to drilling, ASE obtained a drilling permit from ACPWA. A copy of this permit is presented in Appendix A.

On October 9, 1998, Gregg Drilling of Martinez, California drilled soil borings BH-A through BH-E at the site using a Geoprobe hydraulic sampling rig (Figure 2). The drilling was directed by ASE staff geologist Greg Schramm and senior project manager David Allen.

Undisturbed soil samples were collected continuously as drilling progressed for lithologic and hydrogeologic description and for possible chemical analysis. The samples were collected by driving a sampler lined with acetate tubes using hydraulic direct push methods. Selective soil samples were immediately cut at the appropriate sampling interval, trimmed, sealed with Teflon tape, plastic end caps and duct tape, labeled, sealed in plastic bags and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP #1094) under chain of custody. Soil from the remaining tubes were described by the site geologist and was periodically screened for volatile compounds using an Organic Vapor Meter (OVM). The soil was screened by emptying soil from one of the sample tubes into a plastic bag. The bag was then sealed and placed in the sun for approximately 10 minutes. After the volatile compounds were allowed to volatilize, the OVM measured the vapor in the bag through a small hole punched in the bag. OVM readings are used as a screening tool only, since the procedures are not as rigorous as those used in the laboratory.

A temporary PVC well casing was driven into place in each boring for the collection of groundwater samples. Groundwater samples were removed from the borings with disposable polyethylene bailers. The groundwater samples were contained in 40-ml volatile organic analysis (VOA) vials (pre-preserved with hydrochloric acid) and capped without headspace. The samples were then labeled, placed in protective foam sleeves, and stored on ice for transport to Chromalab under chain of custody. Upon completion of the soil and groundwater sampling, the borings were backfilled with neat cement to the ground surface.

Drilling equipment was cleaned with a TSP solution between sampling intervals and between borings to prevent potential cross-contamination.

Sediments encountered during drilling generally consisted of up to three feet of a debris-free silty clay fill overlying a sandy fill material containing wood and asphalt shingle roofing material, brick and rubber to the total

depth explored of 8-feet below ground surface (bgs). No native soil was encountered. Groundwater was encountered at between 4 and 6 feet bgs and rose to approximately 4-feet bgs in each boring where it stabilized. Petroleum hydrocarbon odors and/or olive hydrocarbon staining were present in soil samples from borings BH-A, BH-B and BH-C. A hydrocarbon sheen was present on groundwater from boring BH-A. There were no obvious indications of hydrocarbons in borings BH-D and BH-E.

5.0 ANALYTICAL RESULTS FOR SOIL

One soil sample was collected from each boring for analysis. The soil sample chosen for analysis was collected from what appeared to be the capillary zone in each boring, just above completely saturated sediments. The samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015 and BTEX and MTBE by EPA Method 8020. The analytical results are tabulated in Table One, and the certified analytical report and chain of custody form are included in Appendix B.

TABLE ONE
Summary of Chemical Analysis of **SOIL** Samples
All results are in **parts per million**

Boring	Depth Sampled	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE
BH-A	6.0'	1,400	<6.2	25	7.1	15	<6.2
BH-B	3.5'	<1.0	0.0090	0.0083	0.012	0.039	<0.0050
BH-C	4.0'	<1.0	0.011	<0.0050	0.080	0.16	<0.0050
BH-D	4.0'	<1.0	<0.0050	<0.0050	<0.0050	0.0087	<0.0050
BH-E	5.5'	<1.0	<0.0050	<0.0050	<0.0050	<0.0050	<0.0050
PRG		NE	1.4	880	230	320	NE

Notes:

Detectable concentrations are in **bold**.

Non-detectable concentrations are noted by the less than sign (<) followed by the detection limit.

PRG is the United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goal (PRG) for industrial soil.

NE = US EPA PRG is not established.

The soil sample collected from 6.0-foot bgs in boring BH-A contained 1,400 parts per million (ppm) TPH-G, 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX compound at concentrations below 1 ppm. None of the BTEX concentrations detected at the site exceeded United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goals (PRGs) for industrial soil.

6.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015 and BTEX and MTBE by EPA Method 8020. The analytical results are tabulated in Table Two, and the certified analytical report and chain of custody forms are included in Appendix B.

TABLE TWO
Summary of Chemical Analysis of **GROUNDWATER** Samples
All results are in **parts per billion**

Boring	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE
BH-A	620,000	1,200	4,900	16,000	64,000	< 1,000
BH-B	40,000	280	110	3,200	6,400	< 250
BH-C	18,000	56	280	150	120	< 50
BH-D	< 50	< 0.5	< 0.5	< 0.5	< 0.5	< 5.0
BH-E	< 50*	< 0.5	< 0.5	< 0.5	1.2	< 5.0
DTSC MCL	NE	1.0	150	700	1,750	35**

Notes:

DTSC MCL is the California Department of Toxic Substances Control maximum contaminant level for drinking water.

NE = DTSC MCLs is not established.

* = Hydrocarbons uncharacteristic of gasoline detected in gasoline range at 98 parts per billion.

** = DTSC interim action level for drinking water. MCL not established.

Detectable concentrations are in **bold**.

Elevated hydrocarbon concentrations, including benzene, toluene, ethylbenzene and/or total xylene concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water, were detected in groundwater samples collected from the borings BH-A, BH-B and BH-C in the vicinity of the former UST at the site. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Up to 1,400 ppm TPH-G, 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX compounds at concentrations below 1 ppm. None of the BTEX concentrations exceeded US EPA PRGs for industrial soil. No MTBE was detected in any of the soil samples analyzed.

Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding DTSC MCLs for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

Based on these results, ASE anticipates that the ACHCSA will require further assessment activities, including the installation of three groundwater monitoring wells and at least one year of groundwater monitoring, prior to considering case closure at this site.

8.0 REPORT LIMITATIONS

The results of this assessment represent conditions at the time of the soil and groundwater sampling, at the specific locations where the samples were collected, and for the specific parameters analyzed by the laboratory.

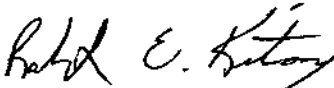

This report does not fully characterize the site for contamination resulting from unknown sources or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of an independent CAL-EPA certified laboratory. The

independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

Aqua Science Engineers appreciates the opportunity provide environmental consulting services for this project. Should you have any questions or comments, please feel free to call us at (925) 820-9391.

Respectfully submitted,

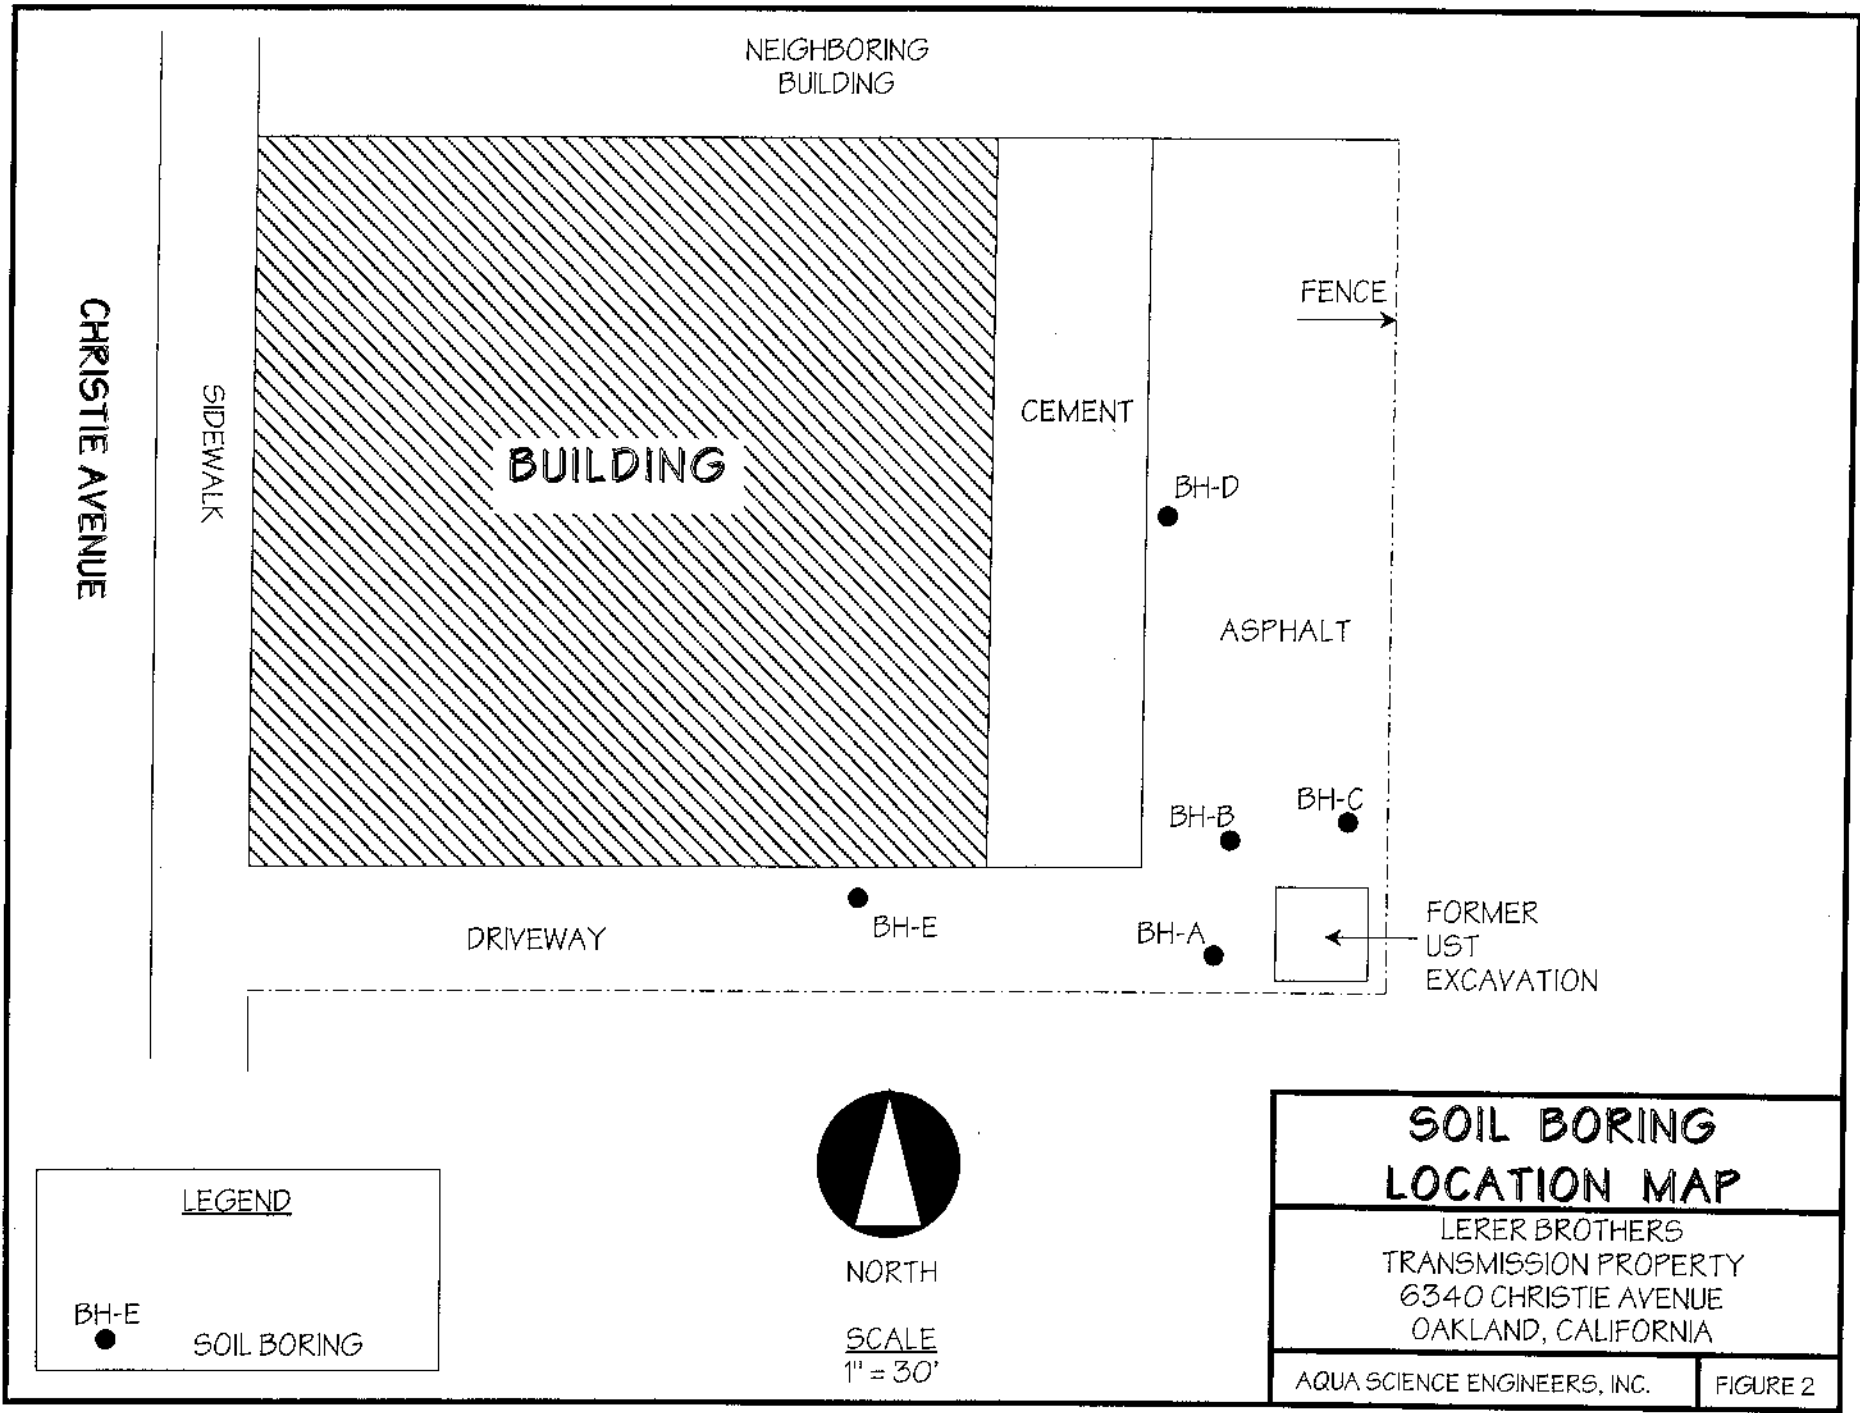

AQUA SCIENCE ENGINEERS, INC.

Robert E. Kitay, R.G., R.E.A.
Senior Geologist

1.0 INTRODUCTION

This report presents the methods and findings of Aqua Science Engineers, Inc. (ASE)'s soil and groundwater assessment at the Lerer Brothers Transmission Service property located at 6340 Christie Avenue in Emeryville, California (Figure 1). The site assessment activities were initiated by Mr. Rick Gold of Lerer Brothers Transmission Service as required in a letter from the Alameda County Health Care Services Agency (ACHCSA) dated December 7, 1998 (Appendix A).

2.0 SITE HISTORY

One 2,000 gallon steel underground storage tank (UST) used to store unleaded gasoline was removed from the site in 1988. No verifiable records have been located regarding the UST removal.

On October 9, 1998, ASE drilled five soil borings at the site (Figure 2). Up to 1,400 parts per million (ppm) total petroleum hydrocarbons as gasoline (TPH-G), 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX (benzene, toluene, ethylbenzene and total xylenes) compound at concentrations below 1 ppm. None of the BTEX concentrations exceeded United States Environmental Protection Agency (US EPA) Region IX preliminary remediation goals (PRGs) for industrial soil. No methyl tertiary butyl ether (MTBE) was detected in any of the soil samples analyzed.

Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

3.0 SCOPE OF WORK (SOW)

Based on the site history and requirements of the ACHCSA, ASE's SOW was as follows:

- 1) Prepare a workplan and a health and safety plan for approval by the ACHCSA.
- 2) Obtain a drilling permit from the Alameda County Public Works Agency (ACPWA).
- 3) Drill three (3) soil borings to approximately 19-feet below ground surface (bgs) at the site.
- 4) Analyze at least one soil sample from each boring at a CAL-EPA certified analytical laboratory for TPH-G by modified EPA Method 5030/8015, BTEX and MTBE by EPA Method 8020 and lead by EPA Method 6010.
- 5) Install 2-inch diameter groundwater monitoring wells in each boring described in task 3.
- 6) Develop the monitoring wells.
- 7) Collect groundwater samples from each monitoring well for analyses.
- 8) Analyze the groundwater samples at a CAL-EPA certified analytical laboratory for TPH-G, BTEX, MTBE and dissolved lead.
- 9) Survey the top of casing elevation of each well, and determine the groundwater flow direction and gradient beneath the site.
- 10) Prepare a report detailing the methods and findings of this assessment.

Details of this assessment follow.

4.0 DRILLING SOIL BORINGS AND COLLECTING SAMPLES

Prior to drilling, ASE obtained an Alameda County Public Works Agency drilling permit (Appendix B). ASE also notified Underground Service Alert (USA) to have underground public utilities in the vicinity of the site marked prior to drilling.

On January 21, 1999, Kvilhaug Well Drilling of Concord, California drilled soil borings MW-1, MW-2 and MW-3 at the site using a Mobile B-61 drill rig equipped with 8-inch diameter hollow-stem augers (Figure 3). Groundwater monitoring wells MW-1, MW-2 and MW-3 were subsequently

constructed in these borings. These locations were chosen to monitor groundwater adjacent to and downgradient of the former UST. The groundwater flow direction was assumed to be to the west based on ASE's knowledge of regional groundwater flow as well as conversations with Ms. Susan Hugo of the ACHCSA, the case worker for several sites in the site vicinity. The drilling was directed by ASE staff geologist Greg Schramm and ASE senior geologist Robert E. Kitay, R.G.

Undisturbed soil samples were collected at 5-foot intervals as drilling progressed for lithologic and hydrogeologic description and for possible chemical analyses. The samples were collected by driving a split-barrel drive sampler lined with 2-inch diameter brass tubes ahead of the auger tip with successive blows from a 140-lb. hammer dropped 30-inches. One tube from each sampling interval was immediately trimmed, sealed with Teflon tape, plastic end caps and duct tape, labeled, sealed in a plastic bag and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP #1094) under chain of custody. Soil from the remaining tubes was described by the site geologist using the Unified Soil Classification System.

Drilling equipment was steam-cleaned prior to use, and sampling equipment was washed with a TSP solution between sampling intervals to prevent cross-contamination. Rinsate was contained on-site in sealed and labeled 55-gallon steel drums.

Sediments encountered during drilling generally consisted of silty or gravelly sand with abundant debris such as tar, tar paper, roofing shingle material, railroad ties and railroad spikes. Hydrocarbon odors were present in all three borings, including strong odors at times. Groundwater was encountered between 3.7 and 6.5-feet bgs. The boring logs and well construction details are included as Appendix C. Based on conversations with Ms. Hugo of the ACHCSA, this type of fill material is very common in the site vicinity. She also stated that there may have been a tar or asphalt plant in the immediate site vicinity.

Drill cuttings were contained in sealed and labeled 55-gallon steel drums and stored on-site for temporary storage until off-site storage can be arranged.

5.0 ANALYTICAL RESULTS FOR SOIL

The soil sample collected from 4.5-foot bgs in each boring was analyzed by Chromalab, Inc. for TPH-G by modified EPA Method 5030/8015, BTEX

and MTBE by EPA Method 8020 and total lead by EPA Method 7420. The analytical results are tabulated in Table One, and a copy of the certified analytical report and chain of custody form are included in Appendix D.

TABLE ONE
Summary of Chemical Analysis of SOIL Samples
All results are in parts per million

Boring	Depth Sampled	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE	Total Lead
MW-1	4.5'	< 100*	< 6.2	< 6.2	13	27	< 6.2	130
MW-2	4.5'	< 1.0	< 0.0050	< 0.0050	< 0.0050	< 0.0050	< 0.0050	49
MW-3	4.5'	< 1.2	< 0.005	< 0.005	0.0073	0.027	< 0.005	72
PRG		NE	0.62	520	230	210	NE	130

Notes:

Non-detectable concentrations are noted by the less than symbol (<) followed by the detection limit.

Detectable concentrations are in **bold**.

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 1,500 parts per million.

PRG is the United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goal (PRG) for residential soil.

None of the hydrocarbon or lead concentrations detected during this assessment exceeded US EPA PRGs for residential soil.

6.0 MONITORING WELL INSTALLATION, DEVELOPMENT AND SAMPLING

Groundwater monitoring wells MW-1, MW-2 and MW-3 were installed in borings MW-1, MW-2 and MW-3, respectively. The wells were constructed with 2-inch diameter, 0.020-inch slotted, flush-threaded, Schedule 40 PVC well screen and blank casing. Each well is screened between 3-feet bgs and the total depth of the well, between 15 and 19-feet bgs, to monitor the first water bearing zone encountered. Lonestar #3 Monterey sand occupies the annular space between the borehole and the casing from the bottom of the boring to approximately 1-foot above the well screen. A 0.5-foot thick hydrated bentonite layer separates the sand from the overlying cement surface seal. The wellheads are secured with locking wellplugs beneath at-grade traffic-rated vaults.

On January 24, 1999, ASE staff geologist Greg Schramm developed each monitoring well using at least two episodes of surge-block agitation and bailer evacuation. Over ten well casing volumes of water were removed from each well during development, and evacuation continued until the water was relatively clear.

On January 28, 1999, ASE staff geologist Greg Schramm collected groundwater samples from each monitoring well for analysis. A sheen was present on the surface of groundwater in all three monitoring wells. Prior to sampling, the wells were purged of four well casing volumes of groundwater. The pH, temperature and conductivity of the purge water were monitored during evacuation, and samples were not collected until these parameters stabilized. Samples were collected from the wells using pre-cleaned polyethylene bailers. The groundwater samples were decanted from the bailers into 40-ml volatile organic analysis (VOA) vials, preserved with hydrochloric acid and sealed without headspace. The samples for lead analysis were contained in 500-ml polyethylene bottles. All of the samples were labeled and stored on ice for transport to Chromalab, Inc. of Pleasanton, California under chain of custody. The laboratory was instructed to filter and preserve the samples for lead analysis immediately upon receipt. Well development and sampling purge water were contained in 55-gallon steel drums and stored on-site for temporary storage. See Appendix E for a copy of the Field Logs.

7.0 GROUNDWATER ELEVATIONS

ASE surveyed the top of casing elevation of each well relative to a site datum on January 28, 1999. An assumed site datum elevation of 10.00-feet above mean sea level (msl) was interpolated from the USGS Oakland West, California 7.5 Minute Quadrangle (1980). The top of casing elevation of monitoring well MW-1 was set at 10.00-feet and the top of casing elevations of monitoring wells MW-2 and MW-3 were surveyed relative to monitoring well MW-1. Depths to groundwater were measured in each well prior to sampling on January 28, 1999 with an electric water level sounder. Depth to groundwater measurements are presented in Table Two, and groundwater elevation (potentiometric surface) contours are plotted on Figure 4. On January 28, 1999, groundwater appeared to flow to the south beneath the site at a gradient of 0.0138-feet/foot.

TABLE TWO
Summary of Groundwater Well Survey Data

Well I.D.	Date of Measurement	Top of Casing Elevation (relative to project datum)	Depth to Water (feet)	Groundwater Elevation (project data)
MW-1	1-28-99	10.00	4.85	5.15
MW-2	1-28-99	9.96	4.17	5.79
MW-3	1-28-99	9.25	4.23	5.02

8.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015, BTEX and MTBE by EPA Method 8020 and dissolved lead by EPA Method 6010. The analytical results are tabulated in Table Three, and copies of the certified analytical report and chain of custody form are included in Appendix F.

TABLE THREE
Summary of Chemical Analysis of **GROUNDWATER** Samples
All results are in **parts per billion**

Well	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE	Dissolved Lead
MW-1	730	22	3.3	24	61	<5.0	<5.0
MW-2	710	20	180	14	67	<5.0	<5.0
MW-3	<50*	<0.5	<0.5	<0.5	0.69	<5.0	<5.0
DTSC MCL	NE	1.0	150	700	1,750	35**	15

Notes:

DTSC MCL is the California Department of Toxic Substances Control maximum contaminant level for drinking water.

NE = DTSC MCLs are not established.

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 68 parts per billion.
** = DTSC interim action level for drinking water; MCL not established.

Detectable concentrations are in **bold**.

Non-detectable concentrations noted by the less than sign (<) followed by the detection limit.

Benzene concentrations detected in groundwater samples collected from monitoring wells MW-1 and MW-2 exceeded the DTSC MCL for drinking water. The toluene concentration detected in groundwater samples collected from monitoring well MW-2 also exceeded the DTSC MCL for drinking water. Only very low concentrations of hydrocarbons, below DTSC MCLs for drinking water, were detected in groundwater samples collected from monitoring well MW-3. No lead was detected in groundwater samples collected from any of the monitoring wells.

9.0 CONCLUSIONS AND RECOMMENDATIONS

None of the hydrocarbon or lead concentrations detected in soil samples collected during this assessment exceeded US EPA PRGs for residential soil.

Benzene concentrations detected in groundwater samples collected from monitoring wells MW-1 and MW-2 exceeded DTSC MCLs for drinking water. The toluene concentration detected in groundwater samples collected from monitoring well MW-2 also exceeded the DTSC MCL for drinking water. No lead was detected in groundwater samples collected from any of the monitoring wells.

Based on the potentiometric surface contours, groundwater appears to flow to the south beneath the site at a gradient of 0.0138-feet/foot. This groundwater flow direction is not consistent with the expected groundwater flow direction to the west which was based on information provided by the ACHCSA and ASE's knowledge of regional groundwater in the Emeryville area.

Strong odors were present in soil encountered beneath the site, and a sheen was detected on the groundwater surface in the site monitoring wells. The analytical results do not indicate as significant contamination as field conditions would indicate. Based on this information, it appears that there is contamination beneath the site that is possibly related to the fill material beneath the site and not the former gasoline UST.

ASE recommends that groundwater samples be collected from the site wells on a quarterly basis. In addition, ASE recommends that water level measurements be collected from the site on a monthly basis for the next quarter to confirm the groundwater flow direction beneath the site. If the groundwater flow direction remains to the south, an additional groundwater monitoring well may be necessary downgradient of the former UST. The next groundwater sampling at the site is scheduled for April 1999. Lead analyses will be discontinued in future sampling periods.

10.0 REPORT LIMITATIONS

The results of this assessment represent conditions at the time of the soil and groundwater sampling, at the specific locations where the samples were collected, and for the specific parameters analyzed by the laboratory.

It does not fully characterize the site for contamination resulting from unknown sources, or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of an independent CAL-EPA certified laboratory. The independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

Aqua Science Engineers appreciates the opportunity to assist Lerer Brothers Transmission Service with their environmental needs. Should you have any questions or comments, please feel free to call us at (925) 820-9391.

Respectfully submitted,

This report presents the results of the October 22, 1999 quarterly groundwater sampling and additional boring groundwater sampling for the above-referenced site. This sampling was conducted as required by the ACHCSA. ASE has prepared this report on behalf of Mr. Richard Gold, owner of the property.

2.0 DRILL TWO ADDITIONAL SOIL BORINGS AND COLLECT GROUNDWATER SAMPLES

Two soil borings were drilled on the neighboring property to the south to determine the extent of groundwater contamination downgradient of the site. Prior to drilling, ASE obtained an access agreement from the neighboring property owner, The Martin Group, to allow this drilling on their property. ASE also obtained a drilling permit from the Alameda County Public Works Agency (ACPWA). A copy of this permit is presented in Appendix A.

On October 22, 1999, Gregg Drilling of Martinez, California drilled soil borings BH-F and BH-G on The Martin Group property south of the site using a Geoprobe hydraulic sampling rig (Figure 2). These borings were drilled south of the former Underground Storage Tank (UST) to determine the extent of groundwater contamination downgradient of the UST. The drilling was directed by ASE associate geologist Ian Reed and senior geologist Robert E. Kitay, R.G.

Undisturbed soil samples were collected continuously as drilling progressed for lithologic and hydrogeologic description. No soil samples were retained for analysis. The samples were collected by driving a sampler lined with acetate tubes using hydraulic direct push methods. Soil was described by the site geologist using the Unified Soil Classification System. Boring logs are presented in Appendix B.

Groundwater samples were removed from the borings with a bailer. The groundwater samples were contained in 40-ml volatile organic analysis (VOA) vials, preserved with hydrochloric acid, and sealed without headspace. The samples were then labeled and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP 1094) under chain of custody. Upon completion of the groundwater sampling, the borings were backfilled with neat cement to the ground surface.

Drilling equipment was cleaned with a TSP solution between sampling intervals and between borings to prevent potential cross-contamination.

3.0 GROUNDWATER FLOW DIRECTION AND GRADIENT

On October 22, 1999, ASE environmental scientist Ian Reed measured the depth to water in each site groundwater monitoring well using an electric water level sounder. The surface of the groundwater was also checked for the presence of free-floating hydrocarbons or sheen. There was no free-

floating product or sheen present in any well. Current and historical groundwater elevation data is presented as Table One.

TABLE ONE
Groundwater Elevation Data

Well I.D.	Date of Measurement	Top of Casing Elevation (relative to project datum)	Depth to Water (feet)	Groundwater Elevation (project data)
MW-1	1-28-99	10.00	4.85	5.15
	3-29-99		4.85	5.15
	7-20-99		5.08	4.92
	10-22-99		5.08	4.92
MW-2	1-28-99	9.96	4.17	5.79
	3-29-99		3.89	6.07
	7-20-99		4.30	5.66
	10-22-99		4.36	5.60
MW-3	1-28-99	9.25	4.23	5.02
	3-29-99		4.41	4.84
	7-20-99		3.86	5.39
	10-22-99		3.94	5.31

A groundwater potentiometric surface map is presented as Figure 2. The groundwater flow direction is to the southeast with a gradient of approximately 0.014-feet/foot. This groundwater flow direction and gradient are consistent with historical groundwater flow direction and gradient data which consistently shows the groundwater flow beneath the site to the south or southeast.

4.0 GROUNDWATER SAMPLE COLLECTION AND ANALYSIS

Prior to sampling, each monitoring well was purged of four well casing volumes of groundwater using a dedicated bailer. Slight petroleum hydrocarbon odors were present during the purging and sampling of the groundwater monitoring wells. The parameters pH, temperature and conductivity were monitored during the well purging. Samples were not collected until these parameters stabilized. Groundwater samples were collected from each well using dedicated polyethylene bailers. The samples were decanted from the bailers into 40-ml VOA vials, preserved with hydrochloric acid, sealed without headspace, labeled and placed in coolers with wet ice for transport to Chromalab under appropriate chain-

of-custody documentation. Well sampling field logs are presented in Appendix C.

5.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples collected from all three groundwater monitoring wells, as well as from borings BH-F and BH-G, were analyzed for total petroleum hydrocarbons as gasoline (TPH-G) by EPA Method 5030/8015M, benzene, toluene, ethylbenzene and total xylenes (collectively known as BTEX) by EPA Method 8020 and methyl tertiary butyl ether (MTBE) by EPA Method 8020. The analytical results are presented in Table Two. The certified analytical report and chain-of-custody documentation are included as Appendix D.

Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and boring BH-F all exceeded the California Department of Health Services (DHS) maximum contaminant level (MCL) for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. Although the benzene concentrations exceeded the DHS MCL for drinking water, these concentrations are relatively low and would not be considered a threat to human health in non-drinking water scenarios. The hydrocarbon trends are relatively stable although there does appear to be a slight increasing trend in hydrocarbon concentrations in groundwater samples collected from monitoring well MW-1.

TABLE TWO
Certified Analytical Results of GROUNDWATER Samples
All results are in parts per billion

Well ID & Dates Sampled	TPH-G	Benzene	Toluene	Ethyl- benzene	Total Xylenes	MTBE	Lead
MW-1							
1-28-99	730	22	3.3	24	61	< 5.0	< 5.0
3-29-99	950	37	5.7	27	60	< 5.0	--
7-20-99	970	40	5.4	67	120	< 5.0	--

10-22-99	70**	< 0.5	< 0.5	< 0.5	< 0.5	< 5.0	--
BH-F	65	1.2	< 0.5	1.4	2.4	< 5.0	--
BH-G	180**	< 1.0	< 1.0	1.5	9.1	< 10	--
DHS MCL	NE	1	150	700	1,750	13	15
EPA METHOD	5030/ 8015M	8020	8020	8020	8020	8020	6010

Notes:

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 68 ppb.

** = Hydrocarbons detected do not match a gasoline standard.

-- = Not analyzed

NE = DHS MCL not established

DHS MCL = Department of Health Services maximum contaminant level for drinking water.

Non-detectable concentrations noted by the less than sign (<) followed by the laboratory detection limit.

4.0 CONCLUSIONS

The groundwater flow direction beneath this site is to the southeast at a gradient of 0.014 feet/foot, which is consistent with the historical groundwater flow direction and gradient beneath the site.

Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and boring BH-F all exceeded the DHS MCL for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. Although the benzene concentrations exceeded the DHS MCL for drinking water, groundwater in the site vicinity is not used for drinking water. In non-drinking water scenarios, these concentrations would be considered relatively low and not a threat to human health or the environment. The hydrocarbon trends are relatively stable although there does appear to be a slight increasing trend in hydrocarbon concentrations in groundwater samples collected from monitoring well MW-1.

5.0 RECOMMENDATIONS

Based on the relatively low hydrocarbon concentrations detected in groundwater samples collected during the one year of quarterly groundwater monitoring, the limited horizontal extent of hydrocarbons in groundwater, and the current commercial/industrial usage of the site, ASE recommends that the ACHCSA and RWQCB review this case for closure.

6.0 REPORT LIMITATIONS

The results presented in this report represent the conditions at the time of the groundwater sampling, at the specific locations where the groundwater samples were collected, and for the specific parameters analyzed by the laboratory. It does not fully characterize the site for contamination resulting from sources other than the former underground storage tanks and associated plumbing at the site, or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of independent CAL-EPA certified laboratory. The independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

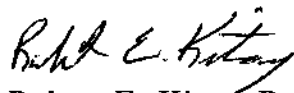

Aqua Science Engineers appreciates the opportunity to provide environmental consulting services to Lerer Brother Transmission Service, and trust that this report meets your needs. Please feel free to call us at (925) 820-9391 if you have any questions or comments.

Gentlemen:

Re: Claim # 013874

Susan Hugo, Alameda County Health Dept., gave me permission to have all three wells removed from 6340 Christie Ave., Emeryville. Last Friday, April 28, 2000, Aqua Science Engineers supervised the removal of the wells.

I am awaiting the necessary paperwork for "closure." When everything is completed I will forward it to you.

Sincerely,

Richard Gold

Re: Claim #013874,
6340 Christie, Emeryville, CA

Gentlemen:

As per my phone conversation yesterday morning with Dolores Ortiz, I am requesting a 30-day extension on the above-listed claim. As I stated in my letter dated May 3, 2000 all the wells have been removed after receiving permission from Susan Hugo of the Alameda Health Dept. This letter will explain the delay in receiving closure and applying for reimbursement from The Fund.

Evidently, the site contains just enough contamination to prevent it from being used for residential purposes, or a school, hospital. However, the site is satisfactory for a commercial, business, or industrial use. I have presently leased it to an electrical supply and parts company.

Susan Hugo advises me that in order to receive closure, a "deed restriction" must be recorded by Alameda County. This is what is causing the delay. The County is in the process of preparing a standard form to be used. Last weeks Susan Hugo told me that it might take another month to complete the form (?). She suggests that I wait until it is completed rather than use an old format that she sent me.

I explained to Mrs. Hugo that my Letter of Commitment might be withdrawn. I will ask her again around the end of July, and if the form is still not ready I will use the old format and do the best I can.

Sincerely,

A handwritten signature in cursive script that reads "Richard Gold".

SUBJECT: CASE CLOSURE REQUEST
Lerer Brothers Transmission Service
6340 Christie Avenue
Emeryville, California

Dear Ms. Drogos:

In May 2000, the Alameda County Health Care Services Agency (ACHCSA) agreed to close the above-referenced case once a deed restriction was put into place. The deed restriction was to exclude the site from use as residential, school, day care facilities and hospitals. The case worker at the time for the ACHCSA was Susan Hugo. My client, Mr. Richard Gold, the property owner, at the time decided to not sell the property and did not complete the deed restriction. Mr. Gold recently contacted ASE as he would like to pursue obtaining case closure for the site once again. His hope is to complete the case closure without a deed restriction if possible. The short term planned use of the property is a winery. The following is a brief history of the case:

SITE HISTORY

One 2,000 gallon steel underground storage tank (UST) used to store unleaded gasoline was removed from the site in 1988.

In October 1998, five soil borings were drilled at the site and soil and groundwater samples were collected. Up to 1,400 parts per million (ppm) total petroleum hydrocarbons as gasoline (TPH-G), 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX (benzene, toluene, ethylbenzene and total xylenes) compounds

at concentrations below 1 ppm. None of the BTEX concentrations exceeded United States Environmental Protection Agency (US EPA) Region IX preliminary remediation goals (PRGs) for industrial soil. No methyl tertiary butyl ether (MTBE) was detected in any of the soil samples analyzed. Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

In January 1999, monitoring wells MW-1, MW-2 and MW-3 were installed at the site. Sediments encountered during drilling generally consisted of silty or gravelly sand with abundant debris such as tar, tar paper, roofing shingle material, railroad ties and railroad spikes. Hydrocarbon odors were present in all three borings, including strong odors at times. Groundwater was encountered between 3.7 and 6.5-feet below ground surface (bgs). Soil samples collected during the monitoring well installation contained up to 13 ppm ethylbenzene, 27 ppm total xylenes and 130 ppm total lead. None of the hydrocarbon or lead concentrations detected exceeded US EPA PRGs for residential soil. Groundwater samples collected from the monitoring wells contained up to 730 parts per billion (ppb) TPH-G, 22 ppb benzene, 180 ppb toluene, 24 ppb ethylbenzene, and 67 ppb total xylenes. No dissolved lead or MTBE were detected in any of the groundwater samples collected. Groundwater appeared to flow to the south beneath the site at a gradient of 0.0138-feet/foot.

Groundwater samples were collected from the three site monitoring wells on a quarterly basis. The hydrocarbon concentrations were generally consistent over this period. Benzene concentrations in groundwater samples collected from monitoring well MW-1, the well with the highest hydrocarbon concentrations, ranged from 22 ppb to 71 ppb. Over this period, the groundwater flow direction was generally to the south or southeast.

In October 1999, ASE drilled soil borings BH-F and BH-G on The Martin Group property south and southeast of the site using a Geoprobe hydraulic sampling rig. These borings were drilled south of the former UST to determine the extent of groundwater contamination downgradient of the UST. Groundwater samples were also collected from the three site monitoring wells at this time. Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and

boring BH-F all exceeded the DHS MCL for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. The benzene concentration in the groundwater sample collected from boring BH-F was 1.2 ppb, which is just over the DHS MCL for drinking water and essentially defines the downgradient extent of contamination. Although the benzene concentrations exceeded the DHS MCL for drinking water, groundwater in the site vicinity is not used for drinking water. In non-drinking water scenarios, these concentrations would be considered relatively low and not a threat to human health or the environment.

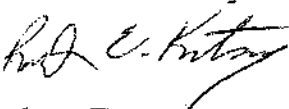

Following completion of the soil and groundwater assessment activities described above, the site groundwater monitoring wells were properly destroyed in May 2000 as approved by the ACHCSA in anticipation of case closure.

REQUEST FOR CASE CLOSURE

On behalf of Mr. Richard Gold, ASE requests that the ACHCSA review the file for the case to determine whether the case may be closed with the available information. If you have any questions, you can reach Robert Kitay of ASE at (925) 820-9391. Richard Gold can be reached at (650) 579-1919.

Respectfully submitted,

Emeryville, California 94608

**QUARTERLY GROUNDWATER MONITORING REPORT
OCTOBER 1996 SAMPLING EVENT
EMERY BAY MARKETPLACE
EMERYVILLE, CALIFORNIA**

Dear Ms. Tolin:

This letter report presents data collected by PES Environmental, Inc. (PES) during the October 1996 quarterly groundwater monitoring conducted at the Emery Bay Marketplace site, located in Emeryville, California (Plate 1). PES has been retained by Christie Avenue Partners - J.S. to conduct quarterly groundwater at the subject site. The current groundwater monitoring program consists of measuring product thickness, if any, and depth to groundwater in 13 onsite and off-site monitoring wells on a quarterly basis, and purging and sampling six of the monitoring wells (Wells W-7, W-13, W-14, W-19, W-20 and W-24). Plate 2 shows the location of monitoring wells at the site.

The purpose of the groundwater monitoring program at this site is to: (1) evaluate the presence of hydrocarbons in groundwater; (2) monitor potential migration of dissolved-phase hydrocarbons; and (3) monitor seasonal water level variations at the subject property. The monitoring is performed in accordance with Alameda County Department of Environmental Health (ACDEH) requirements and the approved work plan for this site entitled *Work Plan for Groundwater Monitoring and Free Product Removal at the Emery Bay Marketplace, Emeryville, California*, prepared by McLaren Hart and dated July 6, 1990.

In addition to the standard scope of work performed during the quarterly groundwater monitoring and at the request of ACDEH, additional groundwater samples were collected during the October 1996 sampling event and analyzed for polynuclear aromatic hydrocarbons (PNAs). The purpose of the analyses was to support an evaluation of the decision for site closure.

Ms. Lynn Tolin
November 27, 1996
Page 2

BACKGROUND

Beginning in the early 1980's, environmental activities at this site consisted of removal of underground fuel storage tanks (USTs) and hydrocarbon contaminated soils, performing soil borings, and installing groundwater monitoring wells. As a result of these activities, fuel oil found in onsite soils and groundwater was attributed to leaking USTs and/or piping associated with an asphalt refinery formerly located at the site. Additionally, free floating product was observed in onsite groundwater monitoring wells.

Twenty-four monitoring wells have been installed at this site during the course of prior environmental investigations. McLaren Hart began quarterly groundwater monitoring activities at the subject site in July 1990. During that time, seven of these wells were abandoned. Due to the construction of the new roadway along the eastern portion of the property, four additional monitoring wells (W-5, W-8, W-15, and W-17) were abandoned on October 8, 1996. As a result, 13 onsite and off-site wells remain at the site. The present sampling is the fourteenth since PES began performing quarterly groundwater monitoring in July 1993.

GROUNDWATER ELEVATIONS

Water-level Measurement Procedures

Prior to sampling, groundwater levels in the monitoring wells were measured by Blaine Tech Services (Blaine Tech) to a precision of 0.01 foot using an electronic water-level indicator/interface probe. Prior to each measurement, the portion of the water-level indicator that was submerged in the well was cleaned with a mild detergent solution and rinsed with de-ionized water. The presence of free-phase product was evaluated and, if present, was measured to a precision of 0.01 foot using an interface probe.

Results

Water levels for the monitoring wells were measured on October 24, 1996. Two of the monitoring wells (Wells W-4 and W-16) were inaccessible due to grading related to construction activities along the adjacent railroad property. Two additional wells (Wells W-13 and W-14) could not be access on October 24 because they had been paved over. The wells were subsequently located and uncovered and groundwater levels were collected on October 30, 1996. Groundwater levels were converted to water-level elevations referenced to mean sea level (MSL). A groundwater elevation map constructed from the data is presented on Plate 3. An historical summary of groundwater elevations and product levels for wells at the site is presented in Table 1, and a report summarizing the water level measurement procedures is presented in Appendix A.

Ms. Lynn Tolin
November 27, 1996
Page 3

Water levels in all measured wells have generally varied relative to the July 1996 sampling event. Water levels decreased in six of the onsite monitoring wells and increased in five wells. Based on measured water levels on October 24 and 30, 1996, groundwater at the site flows in a southwesterly direction with an approximate gradient of 0.004 to 0.007. These measurements show no significant changes from historical groundwater flow direction and gradient.

Consistent with historical monitoring results, a free-phase product layer of 0.08 feet thick was found in Well W-19. No free-phase product or sheen were found in the remaining wells. The groundwater elevation of Well W-19 presented in Table 1 and Plate 3 have been corrected for the free-phase product layer observed.

GROUNDWATER SAMPLING AND ANALYTICAL TESTING

Sampling Protocol

Groundwater samples were collected by Blaine Tech from Wells W-7, W-19, W-20, and W-24 on October 24, 1996, and from Wells W-13 and W-14 on October 30, 1996. A minimum of three well volumes were purged prior to sampling using a clean teflon bailer. Purge water was contained and collected in a 55-gallon drum to be stored onsite prior to obtaining analytical results and subsequent disposal. During purging activities, the discharge water was measured for pH, temperature, electrical conductivity and turbidity. Groundwater samples were collected with a clean teflon bailer and decanted into clean 1-liter glass bottles preserved with hydrochloric acid.

Samples were immediately labeled to designate sample number, time and date collected, and analyses requested, and stored in a chilled, thermally insulated cooler for transport to the analytical laboratory for chemical analyses. The information collected during groundwater sampling activities and the chain of custody record is included in a groundwater sampling report prepared by Blaine Tech and presented in Appendix A.

Analytical Program

All groundwater samples collected during this quarterly monitoring event were analyzed by American Environmental Network (AEN), a State-certified laboratory located in Pleasant Hill, California. Samples were analyzed for total petroleum hydrocarbons quantified as diesel (TPH-diesel) and as motor oil (TPH-oil) by EPA Test Method 8015 (modified). PNAs were analyzed using EPA Test Method 8270.

Ms. Lynn Tolin
November 27, 1996
Page 4

Analytical Results

Sample analytical results from the recent groundwater monitoring event indicate that TPH-diesel was detected in five of the six wells sampled, at concentrations ranging from 0.12 milligrams per liter (mg/l) in Well W-24 to 15 mg/l in Well W-19. TPH-oil was detected in three of the six wells sampled, at concentrations ranging from 0.4 mg/l in Well W-20 and 2.3 mg/l in Well W-19. Concentrations of TPH-diesel have decreased in Wells W-7, W-13, W-14, and W-24, and increased in Well W-19 since the last monitoring event. Concentrations of TPH-oil have decreased in Wells W-7 and W-20, and increased in Well W-19. TPH-oil was not detected in Wells W-13, W-14, and W-24. No PNAs were detected in any of the six wells sampled.

Analytical results, including historical monitoring data for the previous sampling events, are presented in Table 2. The laboratory report and chain of custody records are provided in Appendix B. The distribution of hydrocarbons in groundwater at the site on October 24 and October 30, 1996 is presented on Plate 4.

SUMMARY

Groundwater elevations have generally varied since the July 1996 sampling event; however, the groundwater flow direction and gradient have remained approximately the same. Consistent with historical monitoring results, free-phase product was found on the groundwater in Well W-19. Reported concentrations of TPH-diesel and TPH-oil have generally decreased since the July 1996 monitoring activities, with increased concentrations TPH-diesel and TPH-oil in only one of the six wells sampled. The detected TPH concentrations are generally within the range of concentrations detected in previous monitoring events. No PNAs were present in the groundwater samples.

NOTES:

(1) Well W-1 is located on the Nielson property.

(2) Groundwater elevation taken from earlier reports does not agree with calculated elevation using current top of casing elevation.

(3) Well abandoned on October 8, 1996, therefore, no water-level measurement was collected.

feet MSL = Feet above Mean Sea Level.

NA = Data not available.

NM = Not measured.

NP = Product not present or insufficient amount present to perform measurements.

WCC = Woodward Clyde Consultants

MH = McLaren Hart

PES = PES Environmental, Inc.

GROUNDWATER SAMPLING REPORT 961030-F-1

Blaine Tech Services, Inc. performs specialized environmental sampling and documentation as an independent third party. In order to avoid compromising the objectivity necessary for the proper and disinterested performance of this work, Blaine Tech Services, Inc. does not participate in the interpretation of analytical results, or become involved with the marketing or installation of remedial systems.

This report deals with the groundwater well sampling performed by our firm in response to your request. Blaine Tech Services, Inc. resampled well W-20 due to underpurging at the first event. Data collected in the course of our work at the site are presented in the TABLE OF WELL MONITORING DATA. This information was collected during our inspection, well evacuation and sample collection. Measurements include the total depth of the well and the depth to water. Water surfaces were further inspected for the presence of immiscibles. A series of electrical conductivity, pH, and temperature readings were obtained during well evacuation and at the time of sample collection.

STANDARD PRACTICES

Evacuation and Sampling Equipment

As shown in the TABLE OF WELL MONITORING DATA, the wells at this site were evacuated according to a protocol requirement for the removal of three case volumes of water, before sampling. The wells were evacuated using bailers.

Samples were collected using bailers.

Bailers: A bailer, in its simplest form, is a hollow tube which has been fitted with a check valve at the lower end. The device can be lowered into a well by means of a cord. When the bailer enters the water, the check valve opens and liquid flows into the interior of the bailer. The bottom check valve prevents water from escaping when the bailer is drawn up and out of the well.

Two types of bailers are used in groundwater wells at sites where fuel hydrocarbons are of concern. The first type of bailer is made of a clear material such as acrylic plastic and is used to obtain a sample of the surface and the near surface liquids, in order to detect the presence of visible or measurable fuel hydrocarbon floating on the surface. The second type of bailer is made of Teflon or stainless steel, and is used as an evacuation and/or sampling device.

Bailers are inexpensive and relatively easy to clean. Because they are manually operated, variations in operator technique may have a greater influence than would be found with more automated sampling equipment. Also, where fuel hydrocarbons are involved, the bailer may include near surface contaminants that are not representative of water deeper in the well.

Decontamination

All apparatus is brought to the site in clean and serviceable condition. The equipment is decontaminated after each use and before leaving the site.

Effluent Materials

The evacuation process creates a volume of effluent water which must be contained. Blaine Tech Services, Inc. will place this water in appropriate containers of the client's choice or bring new 55 gallon DOT 17 E drums to the site, which are appropriate for the containment of the effluent materials. The determination of how to properly dispose of the effluent water must usually await the results of laboratory analyses of the sample collected from the groundwater

well. If that sample does not establish whether or not the effluent water is contaminated, or if effluent from more than one source has been combined in the same container, it may be necessary to conduct additional analyses on the effluent material.

Sampling Methodology

Samples were obtained by standardized sampling procedures that follow an evacuation and sample collection protocol. The sampling methodology conforms to both State and Regional Water Quality Control Board standards and specifically adheres to EPA requirements for apparatus, sample containers and sample handling as specified in publication SW 846 and T.E.G.D. which is published separately.

Sample Containers

Sample containers are supplied by the laboratory performing the analyses.

Sample Handling Procedures

Following collection, samples are promptly placed in an ice chest containing deionized ice or an inert ice substitute such as Blue Ice or Super Ice. The samples are maintained in either an ice chest or a refrigerator until delivered into the custody of the laboratory.

Sample Designations

All sample containers are identified with both a sampling event number and a discrete sample identification number. Please note that the sampling event number is the number that appears on our chain of custody. It is roughly equivalent to a job number, but applies only to work done on a particular day of the year rather than spanning several days, as jobs and projects often do.

Chain of Custody

Samples are continuously maintained in an appropriate cooled container while in our custody and until delivered to the laboratory under our standard chain of custody. If the samples are taken charge of by a different party (such as another person from our office, a courier, etc.) prior to being delivered to the laboratory, appropriate release and acceptance records are made on the chain of custody (time, date and signature of person accepting custody of the samples).

Hazardous Materials Testing Laboratory

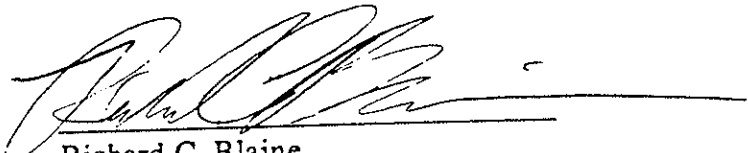

The samples obtained at this site were delivered to American Environmental Network in Pleasant Hill, California. AEN is certified by the California Department of Health Services as a Hazardous Materials Testing Laboratory, and is listed as DOHS HMTL #1172.

Personnel

All Blaine Tech Services, Inc. personnel receive 29 CFR 1910.120(e)(2) training as soon after being hired as is practical. In addition, many of our personnel have additional certifications that include specialized training in level B supplied air apparatus and the supervision of employees working on hazardous materials sites. Employees are not sent to a site unless we are confident they can adhere to any site safety provisions in force at the site and unless we know that they can follow the written provisions of an SSP and the verbal directions of an SSO.

In general, employees sent to a site to perform groundwater well sampling will assume an OSHA level D (wet) environment exists unless otherwise informed. The use of gloves and double glove protocols protects both our employees and the integrity of the samples being collected. Additional protective gear and procedures for higher OSHA levels of protection are available.

Please call if we can be of any further assistance.

PROJECT SUMMARY:

On October 30, 1996, this laboratory received 2 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. On November 5, 1996, client requested additional chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9610400

CLIENT PROJECT ID: EMERY BAY MRKT

Quality Control and Project Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

DATE RECEIVED: 10/24/96
AEN WORK ORDER: 9610332

PROJECT SUMMARY:

On October 24, 1996, this laboratory received 4 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

Larry Klein
Laboratory Director

Revision of report dated 11/07/96 to include EPA 8270 results.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9610332

CLIENT PROJECT ID: EMERY BAY MARKET

Quality Control and Project Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

1.0 INTRODUCTION

1.1 Purpose and Scope of Work

This report presents the results of a Phase I Environmental Site Assessment (ESA) of the commercial building at 6390 Christie Avenue in Emeryville, California (Plate 1). PES Environmental, Inc. (PES) was retained by Allen Matkins Leck Gamble & Mallory, LLP (Allen Matkins) to evaluate the potential for onsite and/or offsite releases of hazardous materials to have affected the subject property. The investigation is being conducted in connection with legal advice being provided by Allen Matkins to TMG Partners (TMG), which is considering purchase of the property from the current owner, Mr. Tom Wolfman. PES understands that TMG's intended use of the property is to demolish the existing structure and redevelop it for mixed uses (e.g., commercial with residential on the upper floors).

The ESA was performed in general accordance with American Society for Testing and Materials (ASTM) guidelines for Phase I Environmental Site Assessments (ASTM E 1527-00), and the Service Agreement for the work (Reference No. 24106202S002). PES conducted the following tasks during the ESA:

- Reviewed Federal, State, and local agency databases to identify nearby sites which have reported the use, storage, or release of hazardous materials;
- Reviewed historical aerial photographs, City Directories, topographic maps and other historical sources for the subject property and surrounding area to evaluate prior land uses;
- Reviewed environmental reports describing previous environmental investigations on the subject property and in the site vicinity;
- Reviewed regulatory agency records for the site and nearby properties;
- Interviewed individuals with knowledge of the site;
- Conducted an inspection of the subject property and a reconnaissance of the surrounding area to provide an assessment of the potential for contamination of the subject property from onsite and/or offsite sources; and
- Prepared this report presenting the results of the Phase I ESA investigation.

1.2 Special Terms and Conditions

PES was not provided chain-of-title documentation. There are no special terms or conditions for this project.

1.3 Limitations

This Phase I Environmental Site Assessment was performed in accordance with practices and procedures generally accepted in the consulting engineering field at the time and place they were performed. Our professional judgment to assess the potential for contamination, including any identified herein, is based on limited data; no warranty is given or implied.

The Phase I Environmental Site Assessment was prepared at the request of Allen Matkins as part of the due diligence for acquisition of the property by TMG Partners or an affiliate, and may be relied on only by TMG, the TMG affiliates, if any, formed to acquire the property, and as identified in the Service Agreement.

2.0 SITE DESCRIPTION

2.1 Location

The subject property consists of an approximately 14,400 square foot commercial building and associated parking lot at the southeast corner of Christie Avenue and 64th Street in Emeryville, Alameda County, California (Plate 1). The site has addresses of 6390 Christie Avenue and 1609 64th Street. The site is bounded on the north by 64th Street, on the east by Emery Bay Marketplace, on the south by a vacant commercial office building, and on the west by Christie Avenue. Access to the parking lot is from 64th Street.

2.2 Site and Vicinity Characteristics

The subject property covers approximately 0.6 acres and consists of a single-story commercial building and associated parking lot. The site is identified by Alameda County Assessor's Parcel Number 049-1492-006-01. The site is located in a former industrial area of Emeryville, which has been undergoing redevelopment for residential and commercial purposes since the mid-1980s.

2.3 Physical Setting

PES reviewed the Oakland West Quadrangle United States Geological Survey (USGS) 7.5-minute topographic map (1993) to evaluate the physical setting. According to the map, the subject property is situated at an elevation of approximately 10 feet above mean sea level, and the terrain slopes gently to the west-southwest. The nearest surface water body is San Francisco Bay, located approximately 500 feet west of the subject property.

2.4 Geology and Hydrogeology

Based on the results of investigations performed in the site vicinity, soils in the area consist primarily of clayey and silty sand fill material overlying native Bay Mud. In the area north of 64th Avenue, previously used as the City of Emeryville's landfill (refer to Section 3.2.2), the fill material contains inert construction materials, including tarpaper, wood, plastic, glass, and rubber. These materials may also be present beneath the subject property. Fill thickness is

estimated at approximately 3 to 15 feet in the site vicinity. The Bay Mud consists of clays and organic material. Depth to shallow groundwater in the site vicinity has been observed at approximately 4 to 12 feet below ground surface (bgs). During prior groundwater investigations performed at the site (see Section 3.3), the groundwater flow direction was observed to be southeasterly to southwesterly. However, based on topography and the results of groundwater investigations performed in the site vicinity, groundwater flow in the site vicinity is generally expected to be west-southwesterly.

The Federal Emergency Management Agency (FEMA) map for the subject property area shows the subject property is not within a 100- or 500-year year flood zone. According to the U.S. Fish and Wildlife 2002 National Wetlands Inventory, there are no wetlands present at the subject property or in the immediate vicinity.

2.5 Descriptions of Existing Onsite Structures and Improvements

2.5.1 Structures and Current Use

The subject property is developed with a single-story commercial building and associated parking lot. At the time of PES' site inspection, the building was occupied by Inter-Tel Technologies and ProMEETium and used primarily for offices and warehousing (refer to Section 5.0 for details).

2.5.2 Other Improvements

Gas and electric service is provided to the subject property by Pacific Gas & Electric. Potable water and sanitary sewer services are provided by City of Emeryville.

2.6 Current Uses of Adjoining Properties

PES conducted a reconnaissance of the surrounding area to assess whether neighboring properties pose potential environmental concerns to the subject site. Adjacent land uses are identified on Plate 2. Adjacent properties are undeveloped or used for commercial purposes. The results of our surrounding area reconnaissance are presented below.

Property to the North

The subject property is bordered on the north by 64th Street. Across 64th Street are the Bay Center Apartments. Facilities historically present at the Bay Center site are listed on several environmental databases (refer to Section 4.3).

Property to the East

The subject property is bordered on the east by parking and a driveway on the Emery Bay Marketplace retail/office property (Marketplace). Beyond the driveway is a movie theater, which is also part of the Marketplace. Facilities historically present at the Emery Bay Marketplace site are listed on several environmental databases (refer to Section 4.3). Beyond the theater are Bay Street and railroad tracks.

Property to the South

The subject property is bordered to the south by a small, vacant office building. The building, formerly occupied by Lerer Brothers Transmission, is listed on the leaking underground storage tank (LUST) and HAZNET databases (refer to Section 4.3). Beyond the building are another driveway and parking lot of the Marketplace commercial property.

Property to the West

The subject property is bordered to the west by Christie Avenue. Further west are vacant commercial buildings undergoing demolition and removal. According to City of Emeryville records, this area is scheduled for redevelopment, as discussed further in Section 4.3. Beyond lie U.S. Interstate 80 and San Francisco Bay.

2.7 Past Uses of the Property and Adjoining Properties

Historical site use information was obtained through a review of historical aerial photographs, Sanborn Fire Insurance Maps, City Directories, historical topographic maps, previous environmental reports, and an interview with the property owner.

2.7.1 Aerial Photograph Review

Aerial photographs from March 24, 1947; September 16, 1949; July 7, 1959; May 2, 1969; April 24, 1973; June 22, 1981; March 30, 1988; August 16, 1996; and August 24, 2003 were provided digitally by Pacific Aerial Surveys in Oakland, California. The results of the aerial photograph review are as follows:

The Subject Property

Photographs from 1947 and 1949 show the subject property as vacant land. Surficial grading or filling appears to be occurring in both photos. On the 1959 photograph, the western end of the subject property is in use as a paved parking lot. The lot appears to be associated with a commercial building present west of the subject property across Christie Avenue. Aerial photographs from 1969 through 2003 show the subject property building present as currently existing.

Surrounding Properties

The 1947 aerial photograph shows commercial buildings south, east, and north of the subject property. On the 1949 photograph, 64th Street appears to be under construction near the subject property, and grading activities are visible in the immediate vicinity. The surrounding area is primarily in commercial use. Four large aboveground storage tanks (ASTs) are present at a commercial facility east of the subject property, along the railroad tracks. Additional smaller ASTs are present further southeast of the subject property at a facility that shows evidence of significant staining over a large area. The area north of the subject property, across 64th Street, appears to be in use as an unpaved storage yard or landfill.

On the 1959 aerial photograph, a new commercial building is present west of the subject property across Christie Avenue, and the storage yard north of the subject property has been cleared and graded. On the 1969 photograph, the graded area north of the site is in use as a paved truck yard with a commercial building, and the commercial buildings and four ASTs east of the site have been replaced with a commercial building and paved parking area. A commercial building is present immediately south of the subject property on previously undeveloped property, and additional commercial buildings are present to the west.

The 1973 photograph shows the presence of a new commercial building northeast of the subject property. A large darkened area is visible in the parking area of the commercial building immediately east of the subject property. No significant changes are visible on the 1981 photograph. On the 1988 photograph, the currently existing Bay Center Apartments have been constructed north of the subject property, the currently existing office buildings and condominium tower are present northwest and southwest of the subject property, respectively, and the area east and further southeast of the subject property has been cleared and graded. On the 1996 photograph, Emery Bay Marketplace redevelopment project appears to have been completed east and southeast of the subject property.

2.7.2 Historical Sanborn Maps

Historical Sanborn Fire Insurance Maps from 1907, 1931, and 1952 were reviewed at Bancroft Library, University of California, Berkeley, California. Sanborn Fire Insurance Maps from 1967 and 1969 were obtained from EDR. The results of the Sanborn map review are as follows:

The Subject Property

Sanborn Maps from 1907 and 1931 indicate the subject property was part of San Francisco Bay. The 1952 Sanborn Map did not extend to the subject property. Sanborn maps from 1967 and 1969 show the subject property occupied by the currently existing building. Building use is indicated as a tool warehouse in the western portion of the building, with a photo lab shown in the eastern third of the building.

Surrounding Properties

Sanborn Maps from 1907 and 1931 show the area east of the subject property, adjacent to the historical San Francisco Bay line, occupied by LaCoste Fertilizer and Bone Works. Hog pens and slaughterhouses are shown northeast of the subject property. The 1952 Sanborn Map shows the area east of the subject property occupied by The Paraffine Companies. Four large and six smaller aboveground storage tanks are shown at the facility, in approximately the same locations as shown on the 1949 aerial photograph (refer to Section 2.7.1).

Surrounding property uses on the 1967 and 1969 Sanborn maps are shown as commercial or industrial. A motor freight and truck repair facility is shown immediately east of the subject property at the former location of The Paraffine Companies. West of the subject property, across Christie Avenue, is Emeryville Industrial Park, which includes a telephone company training center, hospital equipment warehouse, electronics service facility, electric sign service, and a vacant unit. Garrett Freightlines, Inc. is shown north of the subject property, across 64th Street, and Lacoste Meat Company and Farmer’s Packing Company is shown to the northeast. The area immediately south of the subject property is occupied by an industrial machinery warehouse. Railroad tracks are present east of the subject property adjacent to the meat company and motor freight/truck repair facility.

2.7.3 City Directories

Haines Criss-Cross City Directories from 1973 through 2003 were reviewed at the Oakland Public Library in Oakland, California. The results of PES’ City Directory review for the subject property addresses are summarized below. Listings for the surrounding properties were mixed commercial and residential.

**Table 1
Haines Criss-Cross Directory Listings**

Year	1609 64 th Street	6390 Christie Avenue
1973	Audio Specialists FW Dodge Scan	Snap On Tool
1978	Associated Services Co. Audio Specialists Royalty Coffee	Snap On Tool
1983	Mark Starr Tapes East Shore Printing	No listing
1987	No listing	No listing
1992	Adept Ent. Jam Graphic Design	No listing
1996	Levine/Sequoia Appraisal Group	InterTel Technologies
2001	Wood Associates	InterTel Technologies G. Wolfman
2003	ProMeetium	InterTel Technologies G. Wolfman

2.7.4 Historical Topographic Maps

PES reviewed the Oakland West Quadrangle United States Geological Survey 7.5-minute topographic maps from 1980 and 1993. The 1980 map shows the subject property building and adjacent buildings to the south and west as currently existing. Commercial buildings that no longer exist are shown north and east of the subject property. The 1993 map shows the subject property and vicinity in a developed urban area without building footprints shown.

2.7.5 Previous Historical Investigations

Numerous historical investigations were performed in the subject property area during redevelopment activities in the 1980s (refer to Section 4.3). Based on a review of historical topographic maps and other historical maps, the results of previous investigations (LFR, 2004; GTI, 1989; Woodward-Clyde, 1987) indicated that this area of Emeryville was formerly tidal flats. As Emeryville expanded from the late 1800s through at least the 1930s, tidal lands were filled, primarily with imported soil and in certain areas, construction debris (wood, bricks, etc.).

2.7.6 Property Owner Interviews

PES interviewed Mr. Tom Wolfman, owner of the subject property, concerning historical use of the building. Mr. Wolfman indicated that he has owned the building since approximately 1989. In approximately 1990, Mr. Wolfman removed a sub-ground level truck bay and associated sumps, replacing it with the currently existing parking lot configuration. No evidence of contamination was reportedly encountered during removal activities.

Mr. Wolfman reported that historical tenants at the larger tenant space have been Inter-Tel Technologies (1994 to present) and Sybase (1989 to 1994). Historical tenants in the smaller space during Mr. Wolfman's ownership have included an advertising firm and Dictaphone. According to Mr. Wolfman, previous and current tenants have used the space primarily for offices and warehousing, and there has been no known hazardous material use.

3.0 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

RGA Environmental, Inc. (RGA) performed a Phase I ESA Update for the subject property in October 1996 on behalf of Sumitomo Bank. A copy of the report is included as Appendix A. RGA's report updated a Phase I ESA prepared by Tetra Tech dated May 31, 1994, but which was not available for PES's review. Mr. Wolfman reported he no longer had a copy of the report.

The results of RGA's and Tetra Tech's historical research (as reported by RGA) indicated the subject property was undeveloped prior to construction of the existing building in 1966. RGA reported that Tetra Tech, in their 1994 ESA, concluded that there were no obvious signs of contamination or evidence of poor housekeeping at the subject property. RGA further

indicated that Tetra Tech reported the presence of sites within the subject property vicinity that may have an effect on soil or groundwater at the subject property. RGA did not list the specific sites identified by Tetra Tech.

RGA's review of environmental records identified a 1986 spill of concrete sealer at the subject property building. Documentation provided in RGA's report indicated concrete sealer containing xylenes and polymeric resin had spilled in a below-grade dock/ramp area on the north side of the building and accumulated in a 2-foot deep concrete sump. Spilled material was removed from the sump and parking lot storm drain, and the areas were subsequently cleaned. Removed material was disposed offsite. No further action was reportedly required by regulatory agencies. The below-grade dock/ramp area was removed in approximately 1990, as discussed in Section 2.7.6.

RGA also identified an ongoing environmental investigation at the adjacent Emery Bay Marketplace site, located south and east of the subject property. RGA did not review results of environmental investigations, but concluded, based on its upgradient location, that the site had the potential to affect environmental conditions at the subject property. RGA noted the presence of a transmission repair facility (formerly Lerer Brothers Transmission at 6340 Christie Avenue) adjacent to the subject property to the south. RGA observed visible staining and drums containing unknown material at the facility. RGA noted that work practices at the site had the potential to affect the subject property.

At the time of RGA's site inspection, the subject property was occupied by three tenants. RGA did not identify the tenants; however no significant environmental concerns associated with use of the subject property were noted. RGA concluded that, based upon existing interior building materials and extensive remodeling performed in 1994, that the presence of asbestos containing materials at the subject property building was unlikely. RGA did not recommend any further investigation.

4.0 RECORDS REVIEW

4.1 Environmental Liens

Based on review of an environmental database search conducted by Environmental Data Resources, Inc. (EDR), there are no Federal Superfund (National Priority List [NPL]) liens or State deed restrictions associated with the subject property.

4.2 Standard Environmental Record Sources

The discussion presented in this section is based on available information provided by government agencies and various databases. An EDR report dated November 10, 2004 contains listings of sites located within a 1-mile radius, which were selected in accordance with ASTM E-1527-00 standards. This information is obtained from computerized databases of

Federal, State, and local records. Descriptions of the lists reviewed and applicable search radii are presented below. The EDR database report is included as Appendix B.

The following regulatory agency databases were searched and reported in the EDR report:

- U.S. Environmental Protection Agency (EPA) – Comprehensive Environmental Response Compensation, and Liability Information System (CERCLIS) – within ½ mile of the subject property;
- U.S. EPA – CERCLA National Priority List (NPL) – within 1 mile of the subject property;
- California Department of Toxic Substances Control (DTSC) – Hazardous Waste Sites (CAL-SITES) – within 1 mile of the subject property;
- California State Water Resources Control Board (SWRCB) – LUST Incident Reports – within ½ mile of the subject property;
- California EPA/Office of Emergency Protection – Hazardous Waste and Substance Site List (CORTESE List) – within 1 mile of the subject property;
- U.S. EPA – Resource Conservation and Recovery Information System (RCRIS), Treatment, Storage, or Disposal (TSD) facilities (within ½ mile of the subject property) and Small Quantity and Large Quantity Generators of hazardous waste (SQG and LQG) databases – within ¼ mile of the subject property;
- Regional Water Quality Control Board (RWQCB) – Spills, Leaks, Investigation and Cleanups (SLIC) database – within ½ mile of the subject property;
- SWRCB – Hazardous Substance Storage Container Database (USTs) and California EPA Facility Inventory Database (FID) – within ¼ mile of the subject property;
- U.S. EPA – Emergency Response Notification System (ERNS) – the subject property;
- California Integrated Waste Management Board – Solid Waste Information System (SWIS) – within ½ mile of the subject property;
- California EPA Hazardous Waste Information System (HAZNET) – within ¼ mile of the subject property;
- U.S. EPA RCRA Corrective Action Report (CORRACTS) – within 1 mile of the subject property;
- U.S. EPA Facility Index System (FINDS) – the subject property; and
- U.S. EPA Toxic Chemical Release Inventory System (TRIS) – the subject property.

In addition, local, State and Federal supplemental regulatory databases were searched (e.g., AST, Coal Gasification Plants, and Waste Discharge System databases) and summarized in the EDR report. The findings of the review of the EDR report are presented below.

4.3 Regulatory Agency Database Report Summary

The subject property is not listed on the databases searched. No environmental records concerning the subject property were available at the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), Alameda County Department of Environmental Health (ACDEH) or City of Emeryville Fire Department (EFD).

Numerous properties in the site vicinity are listed on hazardous materials storage (e.g., FINDS and UST), hazardous waste generation (RCRIS-SQG), and hazardous materials release (e.g., LUST) databases. Details regarding Emery Bay Marketplace, Bay Center Apartments, and the Pinnacles Project are discussed below based on their proximity to the subject property and environmental investigations conducted at these sites. Summaries of environmental investigations and conditions at the sites closest to the subject property are discussed below. The summaries are based on PES' review of documents at the above-listed regulatory agencies, and documents provided to PES by TMG.

Lerer Brothers Transmission Service, 6340 Christie Avenue is located adjacent to the subject property to the south. The site is listed on the LUST and HAZNET databases. Lerer Brothers discontinued operations at the site in 1998; the building has been vacant since that time. In 1988, a 2,000-gallon gasoline underground storage tank (UST) was removed from the southeast corner of the site. No evidence of soil contamination was noted at the time of the UST removal and no samples were reportedly collected for analysis (ASE, 1998). Ten years thereafter, investigations were performed by Aqua Science Engineers (ASE) on behalf of the 6340 Christie Avenue property owner in October 1998. At that time soil and grab groundwater samples were collected from five soil borings drilled at the site for laboratory analysis (ASE, 1998). A site map showing the tank excavation area and boring locations and tabulated data are presented in Appendix C. Samples were analyzed for total petroleum hydrocarbons quantified as gasoline (TPHg); benzene, toluene, ethylbenzene and xylenes (BTEX); and methyl tert-butyl ether (MTBE). The results indicated the presence of TPHg in soil at a boring near the former UST excavation at a concentration of 1,400 milligrams per kilogram (mg/kg) at a depth of approximately 6 feet bgs (ASE, 1998). Benzene was detected in two of the borings at a maximum concentration of 0.011 mg/kg. TPHg and benzene were detected in three groundwater samples at concentrations as high as 620,000 and 1,200 micrograms per liter ($\mu\text{g/L}$), respectively. MTBE was not detected in any of the soil or groundwater samples.

Three groundwater monitoring wells were installed at the site in 1999 (ASE, 1999a). TPHg and benzene were not detected above laboratory reporting limits in soil samples collected during well installation activities; however, lead was detected in samples collected from each boring at a depth of approximately 4.5 feet bgs at concentrations ranging from 49 to 130 mg/kg (Appendix C). The three wells were sampled approximately quarterly in 1999.

TPHg and benzene were detected in the three wells at concentrations as high as 2,000 and 72 $\mu\text{g}/\text{L}$, respectively (ASE, 2000a). Lead and MTBE were not detected in any of the wells. ASE reported that the groundwater flow direction was southerly to southeasterly. Based on the south to southeasterly groundwater measured at the site, it is unlikely that contamination associated with the former UST at Lerer Brothers Transmission Service affected the subject property. In October 1999, grab groundwater samples were collected from two borings drilled at the adjacent Marketplace property south of the former Lerer Brothers site to evaluate the lateral extent of petroleum hydrocarbons in groundwater (ASE, 1999b). Maps of soil borings and well locations, as well as tabulated data, are presented in Appendix C. TPHg was detected in groundwater collected from both borings at 65 and 180 $\mu\text{g}/\text{L}$, and benzene was detected in one boring at 1.2 $\mu\text{g}/\text{L}$. The three wells previously installed at the site were destroyed in May 2000 with ACDEH approval (ASE, 2000b). Case closure for the site is pending (ASE, 2003). A copy of the closure request is included in Appendix C.

ACDEH records indicate that Lerer Brothers Transmission used motor oil, antifreeze, solvent, and other typical truck repair chemicals, and generated waste oil, sludge, and solvent. No violations were on file concerning hazardous material use or storage at the former Lerer Brothers Transmission facility. No information was available concerning hazardous material use at the site prior to Lerer Brothers Transmission's occupancy; however, as noted above, a gasoline UST was formerly present at the site.

Emery Bay Marketplace is located adjacent to the east side of the subject property. The Marketplace covers approximately 7 acres extending south to approximately 59th Street. It is listed on the Cal-Sites, CORTESE, LUST, SLIC, and CERC-NFRAP databases. Beginning in the late 1800s, the central portion of the site area was occupied by the Paraffine Company (later named PABCO), which was involved in research and development of bituminous and petroleum-based products, asphalt refining, roof material manufacturing and paint manufacturing (Woodward-Clyde, 1987). Most PABCO operations were performed southeast of the subject property, but several structures were located east of the subject property along the railroad tracks, including four large ASTs. Several USTs were present southeast of the subject property, and reportedly contained solvent, crude asphalt, and other chemicals. A map showing the general PABCO site layout is provided in Appendix D. PABCO was purchased by Fiberboard in 1957. In the 1960s, operations at the site were discontinued, and many of the buildings were demolished by 1974.

The area immediately east of the subject property was developed as Nielsen Trucking in the 1960s. Nielsen operations included several diesel, gasoline, and waste oil USTs. Solvents, degreasers, motor oil, and other truck maintenance and repair chemicals were used at the Nielsen site. Operations at Nielsen ceased by the mid-1980s, and the Emery Bay Marketplace area was subsequently redeveloped beginning in the mid-1980s.

Soil and groundwater investigations were performed at the Marketplace beginning in the early 1980s. Soil investigations identified the presence of a subsurface tarry substance layer in the northeast portion of the site, and free-phase petroleum product was identified in groundwater monitoring wells (McLaren, 1989). At least 15 wells were installed to characterize

groundwater quality. A map showing the well locations is included in Appendix E. During installation of a monitoring well (W6) adjacent to the eastern subject property boundary in 1987, layers of tarpaper, metal chips, and a strong tar odor were encountered (Woodard-Clyde, 1987). No petroleum hydrocarbons, volatile organic compounds (VOCs) or PCBs were detected in groundwater collected from this well; however, lead was detected at a concentration of 0.1 mg/L, which is above the U.S. EPA Drinking Water Action Level of 0.015 mg/L. This well appears to have since been destroyed and was not subsequently sampled.

Quarterly groundwater monitoring was performed at most of the Marketplace wells from approximately 1990 to 1996. Small amounts of separate-phase petroleum product have been frequently identified in a well (W-19) located approximately 200 feet east of the subject property. The results of October 1996 groundwater sampling and analysis indicated the presence of approximately 0.08 feet of product in this well. TPH quantified as diesel (TPHd) and as motor oil (TPHmo) were identified in this well at concentrations of 15 and 2.3 mg/L, respectively (PES, 1996). Concentrations of TPHd and TPHmo in groundwater generally increase to the southeast, away from the subject property, closer to the PABCO UST area. These data indicate that groundwater beneath the subject property may have been affected by the historical, offsite operations. A copy of the 1996 quarterly monitoring report is provided in Appendix E.

Bay Center Apartments are located north and northeast of the subject property across 64th Street. The listed site and its former occupants are listed on the CORTESE and SLIC databases. In the 1940s and 50s, portions of the site were used as a landfill by the City of Emeryville (LFR, 2004). From the 1950s until the mid-1980s, the site was used for trucking operations by Garrett Freight Company and Delta Truck Lines. Transo Envelope and LaCoste Meat Company formerly operated on the eastern portion of the site (HLA, 1992).

Twelve USTs were removed from the Bay Center Apartments site in the 1980s prior to construction of the existing Bay Center Apartments in the late 1980s and early 1990s. Subsequent soil and groundwater investigations identified the presence of petroleum hydrocarbons, including free-phase product, in soil and groundwater. Low levels of polynuclear aromatics (PNAs), pesticides, and PCBs were also identified in groundwater (GTI, 1989). A separate-phase hydrocarbon extraction system operated from 1990 to 1991, at which time the operation of the system was discontinued.

Wells at the site were again sampled in 2004 (PES, 2004). The results of groundwater analysis indicated that free-phase remained in three wells at the site, located over 500 feet north of the subject property. Free-phase product is currently manually removed from onsite wells. In the well closest to the subject property (Well MW-3), located approximately 100 feet to the north, TPHd and TPHmo were detected at concentrations up to 3,400 and 3,900 $\mu\text{g/L}$, respectively, in March 2004. During installation of this well in 1989, free-phase product was encountered in soil (GTI, 1989). In 1989, radial groundwater flow, to the northeast in the vicinity of the subject property, was measured. However, groundwater monitoring in 2004 indicated a southwesterly groundwater flow. As a result, because this site is located cross-gradient of the

subject property, groundwater contamination associated with USTs formerly present at the site is not expected to pose a significant environmental concern to the subject property.

Low levels of methane gas were detected in soil at the Bay Center site (GSF, 1987). GSF did not identify methane emissions at the ground surface, but recommended ventilation of elevator shafts and other subsurface areas. Passive methane gas venting systems have been installed in elevator shafts at the Bay Center site. The source of the methane gas is likely from natural degradation of organic materials in subsurface Bay Mud, and/or decomposition of the materials in the fill.

The Pinnacle Project consists of three parcels located west of the subject property across Christie Avenue, and cross- to downgradient with respect to anticipated southwesterly groundwater flow. According to City of Emeryville Planning Department records, the Pinnacle site is planned for redevelopment with a 224-unit apartment building constructed over ground-level parking. During the period of performing this ESA, four vacant commercial buildings historically used for warehousing, offices, and other light industrial businesses were demolished and removed. The site was previously beneath San Francisco Bay and was filled in the 1940s. A 1,000-gallon underground storage tank (UST) was removed from one of the parcels in 1991.

Environmental investigations performed at the Pinnacle site have included the collection of soil and groundwater samples; the samples were analyzed for the presence of TPHg/d/mo, BTEX, VOCs, PCBs, and metals (EFI, 2004). The results of analysis indicated the presence of elevated concentrations of TPHd, TPHmo, antimony, arsenic, cadmium, chromium, copper, lead, and zinc in soil. In addition, TPHd, TPHmo, VOCs (including benzene, MTBE, and chloroform), and metals were detected in groundwater samples. EFI stated that the chemicals detected in groundwater were indicative of regional groundwater contamination, and as such, did not require further assessment or treatment. The City of Emeryville concurred with EFI's determination with regard to groundwater conditions (Emeryville, 2004).

During the soil and groundwater investigations, elevated photo-ionization detector (PID) readings were measured which were attributed to methane gas that is known to be present in the vicinity. A remedial plan has been developed for the site (EFI, 2004), which includes excavation and offsite disposal of contaminated soil. No action is planned to address the identified regional groundwater contamination. A methane gas investigation is planned following soil removal activities. Because this site is located cross- to downgradient of the subject property with respect to groundwater flow, environmental conditions at the Pinnacle site are not expected to pose a significant environmental concern to the subject property. However, the general nature of contaminants identified at the Pinnacle site are likely typical of contaminants present in historical fill materials in the site vicinity.

5.0 SITE INSPECTION

PES personnel inspected the subject property on November 22, 2004 to assess the potential for environmental concerns related to the use or storage of hazardous materials at the subject site or surrounding properties. Observations from PES' site visit are discussed in the following sections. Photographs taken during the site inspection are included as Plates 3 through 5.

The subject property consists of a single-story commercial building and associated parking area covering approximately 0.6 acres at the southeast corner of Christie Avenue and 64th Street in Emeryville, Alameda County, California (Plate 1). The site is bounded on the north by 64th Street, on the east by Emery Bay Marketplace, on the south by a vacant commercial/office building, and on the west by Christie Avenue.

At the time of PES' site inspection, the building was occupied by Inter-Tel Technologies, Inc. (6340 Christie Avenue) and ProMEETium (1609 64th Street). Inter-Tel Technologies, Inc. is a telecommunications company that uses the site primarily for offices. A small portion of the building is used for warehousing and shipping communication equipment, some of which is programmed at the site. ProMEETium develops video and electronic conferencing software. The subject property is currently used by ProMEETium for offices and storage. Hazardous material use within tenant spaces is limited to de minimus quantities of cleaning and office supplies. No concerns were identified with respect to hazardous material use or storage at the subject property.

5.1 Chemicals/Hazardous Substances Containers

No indications of current chemical use and/or storage were identified during PES' site inspection.

5.2 Storage Tanks

No indication of existing or historical onsite ASTs or USTs was identified during PES' regulatory agency file reviews and site inspection.

5.3 Indications of PCBs

No electrical transformers or other indications of PCB use were observed on the subject property.

5.4 Solid Waste Disposal

Solid waste generated at the subject property consists of office wastes. Wastes are picked up and disposed offsite by Waste Management. No concerns were identified with solid waste disposal at the site.

5.5 Other Conditions of Concern

5.5.1 Asbestos Issues

Based on the age of the building, asbestos may be present within the onsite building materials. A comprehensive asbestos survey is recommended prior to significant renovation or demolition activities so these materials, if present, can be properly managed.

5.5.2 Lead-Based Paint Issues

Based on the non-residential use of the building, lead-based paint (LBP) is not considered an environmental concern. Nevertheless, a LBP survey is recommended prior to significant renovation or demolition activities so that LBP, if present, can be properly managed.

5.5.3 Radon Issues

The California Department of Health Services participated in the U.S. EPA's State Radon Survey, which was conducted in 1990 to assess indoor radon levels in single-family homes. As part of the survey, homes in the subject property area were sampled for the presence of radon. The median value for radon levels was reported to be 0.776 pico curies per liter (pCi/l) of air for first floor living areas. This is significantly lower than the U.S. EPA's recommended action level of 4.0 pCi/l.

The State's survey indicates it is unlikely that radon levels in residences (or other above ground structures) in Emeryville are above the action level, and therefore, no radon testing was deemed necessary for this project.

6.0 FINDINGS AND CONCLUSIONS

The subject property consists of an approximately 14,400 square foot commercial building and associated parking lot covering approximately 0.6 acres at the southeast corner of Christie Avenue and 64th Street in Emeryville, Alameda County, California. The site has addresses of 6390 Christie Avenue and 1609 64th Street. The site is bounded on the north by 64th Street, on the east by Emery Bay Marketplace, on the south by a vacant commercial building, and on the west by Christie Avenue. The site is located in an area of Emeryville that is currently used for residential and commercial purposes.

The results of PES' historical research indicate that the site was originally beneath the San Francisco Bay or within tidal flats. This vicinity of Emeryville was filled, primarily with inert construction fill materials, in the 1940s. The subject property was undeveloped until a paved parking was observed on the western end of the subject property in the late 1950s. The subject property building was constructed in 1966, and has been used for commercial purposes. Historical tenants with the potential for hazardous material use include a photo laboratory and a printer. No historical records concerning hazardous material use and storage at the facility

were identified during this ESA. A small spill of concrete sealer was reported at the subject property in 1986. The spill was cleaned up, requiring no further action by regulatory agencies. No historical recognized environmental conditions were identified.

PES' review of local, State, and Federal regulatory agency databases revealed several documented hazardous material release sites located in the study area. Based on: (1) the extensive historical industrial uses of the site vicinity, and (2) the documented hydrocarbon contamination in groundwater surrounding the subject property at 6340 Christie Avenue, Bay Center Apartments, Emery Bay Marketplace, and the Pinnacle Project, it is likely that groundwater quality beneath the subject property has similar characteristics. Additionally, methane gas has been detected at several sites in the subject property vicinity, and may be related to biodegradation of organic material in Bay Muds and/or fill beneath the site. Several other sites listed on hazardous material release databases are not expected to present a significant environmental concern to the subject property based on one or more of the following: (1) the site is located down- or cross-gradient from the subject property with respect to the groundwater flow direction; (2) the release at the site is reported as having only affected soils; (3) the release at the site has been investigated and remediated under regulatory oversight; and/or (4) the site is situated at a distance too great to present a significant environmental concern.

The site is currently used for offices and warehousing. No current hazardous material use was observed at the subject property during PES' site inspection.

The following noteworthy observations were identified on the subject property during the Phase I ESA research and site inspection:

- A photo lab and printer historically operated on the subject property operated at the subject property. No information concerning hazardous materials use and storage at the facility was identified during this ESA.
- Elevated concentrations of petroleum hydrocarbons and metals have been identified in soil in the site vicinity that appears to be associated with historical fill materials.
- Methane in soil gas has been detected in the subject property vicinity that appears to originate from subsurface Bay Muds and/or fill present in this area of Emeryville.

The following recognized environmental condition was identified:

- Petroleum hydrocarbon contamination has been identified on adjacent and nearby properties.

PES makes the following recommendations:

- A Phase II investigation should be performed to evaluate: (1) soil and groundwater quality beneath the site; (2) groundwater conditions that might result from offsite,

upgradient sources; and (3) the potential presence of methane gas in soil beneath the site; and

- Comprehensive asbestos and lead-based paint surveys should be performed prior to significant renovation or demolition activities.

1. INTRODUCTION

1.1. PURPOSE

- Review past and current land use for indications of the manufacture, generation, use, storage and/or disposal of hazardous substances at the site;
- Evaluate the potential for site soil and/or groundwater contamination resulting from past and present land use activities and, to the extent possible, adjacent off-site operations;
- Render findings and professional opinion regarding the potential for environmental contamination at the site;
- If necessary, recommend further investigations to evaluate whether contamination, environmental hazards or special resource value concerns may exist at the locations identified.

1.2. INVOLVED PARTIES

JoAnn Copperud, Certified Environmental Inspector and Certified Asbestos Consultant with RGA Environmental, Inc. (RGA), conducted the Phase I site assessment update and the visual asbestos survey at the subject Property (Property). Karin Schroeter, Registered Environmental Assessor and California Certified Asbestos Consultant, reviewed the report.

2. SCOPE OF WORK

2.1. SCOPE

- Inspect and research all areas of the Property for evidence of potential hazards;
- Review previous Phase I site assessment report prepared by Tetra Tech and include their historical data and any modifications subsequent to their report dated May 31, 1994;
- Research and review information from local, state and federal environmental regulatory agencies and computerized databases concerning the subject Property and its neighbors;
- Identify suspect asbestos containing materials; and
- Submit final Phase I site assessment update report according to Sumitomo Bank's requested scope of work.

2.2. ASSUMPTIONS

The conclusions presented in this report are professional opinions based on the data described in this report. They are intended only for the subject site, and apply only to conditions existing at the time of our study. This report does not provide the level of detail necessary to be utilized for structural demolition or remodeling, or soil or ground water remediation. Changes in applicable standards can occur as the result of legislation or broadening knowledge which may invalidate, wholly or in part, the findings of this report. This report may contain records or database information misidentified by federal, state, or local agencies.

3. SITE OVERVIEW

3.1. PROPERTY LOCATION AND DESCRIPTION

The subject site (Property) is occupied by a one story concrete structure that is approximately 14,000 square feet in area. The building is subdivided into three (3) tenant unit, two of which front 64th Street and one which fronts Christie Avenue. Interior building materials include carpet over concrete slab, drywall, cove siding and exposed fiberglass batting ceilings. The roof was not accessible.

The building was constructed in 1966 and was extensively renovated in 1994. Based on the RGA site inspection conducted on September 27, 1996, the overall condition of the building was good.

3.2. ADJACENT PROPERTIES

The Property is located in a mixed-use area of commercial, light industrial, retail and residential. The immediately adjacent properties are as follows:

North:	Apartment complex
East:	Movie Theater complex, Emery Bay Market Place
South:	Commercial
West:	Transmission repair facility

4. SITE HISTORY AND OPERATIONS

4.1. SANBORN FIRE INSURANCE MAPS

Sanborn maps were ordered from the Sanborn Company through Environmental Data Resources, Inc. in Southport, CT. The following maps were reviewed by Tetra Tech.

- 1912: A fertilizer company was located south of the Property. The Property was not mapped.
- 1951: A paint manufacturer was located south of the Property. The Property was not mapped.

4.2. HISTORIC DOCUMENTATION.

The following historical topographic maps were reviewed by Tetra Tech:

- 1949: The subject Property does not appear to be developed. A highway is mapped approximately 600 feet west. Railroad tracks are located 600 feet to the east. Industrial buildings are located 700 feet to the south.
- 1959: Oil tanks, approximately 450 feet east, are indicated on the map.
- 1980: No significant changes from the previous map.

4.3. AERIAL PHOTOGRAPHS REVIEWED.

The following aerial photographs were reviewed by Tetra Tech :

- 1950: Grading activity is apparent at the subject Property. It appears that new roads are being graded in the general area. The surrounding areas to the east and south appear to be primarily industrial.
- 1974: The subject Property appears in its current configuration. The surrounding area is primarily industrial.
- 1981: No significant changes to previous photograph.

1992: The subject site as it appears in its current configuration. Significant changes in surrounding area with a decrease in industrial usage. Major apartment and movie complexes are visible on adjacent sites.

5. ENVIRONMENTAL SETTING

5.1. PHYSIOGRAPHIC FEATURES

The elevation at the subject Property is approximately 15 feet above mean sea level (MSL). Elevation differences at the subject Property are less than five feet. The U.S. Geological Survey (USGS) Oakland West Quadrangle shows that the topography in the vicinity of the subject Property slopes to the west-southwest. The nearest surface water is the San Francisco Bay located approximately 800 feet west of the subject Property.

5.2. SOILS AND GEOLOGIC CONDITIONS

The Property lies on the flatlands east of the San Francisco Bay. The Bay is a drowned valley which is thought to have originally formed by erosion by the ancestral Sacramento River and subsequently widened by subsidence and a rise in sea level. Quaternary (Pleistocene to recent) sediments deposited in what is now the Bay, include both shallow marine and continental deposits.

The surficial deposit in the area is known as "Bay Mud" and generally occurs in the low lying areas adjacent to the Bay. Bay Mud is composed of unconsolidated, olive gray, blue gray, or black silty clay. Bay Mud is typically highly plastic and varies from soft to stiff in consistency. Organic remains, such as shells and peat, are not uncommon. Permeability is generally low except where lenses of sand occur. Bay Mud is mainly derived from the sediment load carried by the Sacramento and San Joaquin Rivers and has been deposited in the Bay for almost 10,000 years.

According to Flatland Deposits of the San Francisco Bay Region, Bay Mud can be found underlying the subject Property. These recently deposited sediments consist of unconsolidated, water-saturated, plastic clay and silty clay rich in organic material. Artificial fill was used over Bay Mud prior to construction of the building on the Property. Fill is composed of dune sand, silt, clay, rock waste, man-made debris and organic waste.

5.3. GROUNDWATER CONDITIONS

The direction of ground water flow at the subject Property is expected to be toward the west-southwest based on topographic expression. Ground water gradient is reported to the

west at approximately four to seven feet below ground level at the Peterson Manufacturing site.

6. RESULTS OF INVESTIGATION

6.1. SITE INSPECTION AND OBSERVATIONS

On September 27, 1996 RGA conducted site inspections of the Property and surrounding areas. Visual inspection of the Property did not reveal the presence of petroleum products, monitoring wells, unusual odors, or drums.

6.2. ADJACENT SITE AND SITE VICINITY OBSERVATIONS

Visual inspection and observation made in the area of the Property revealed the presence of one apparently unlabeled 55 gallon drum on the adjacent Property to the south. The adjacent Property usage appeared to be automotive. At the time of the survey there was visual evidence of pavement staining on the south side of the Property. Monitoring wells were observed on the adjacent Property to the east approximately 400 feet southeast of the subject Property. No other evidence of improper hazardous materials use, storage, handling or disposal practices was noted in the drive-by inspection of surrounding areas.

6.3. REGULATORY AGENCY LIST REVIEW AND FILE SEARCH

6.3.1. NATIONAL PRIORITY LIST (NPL) - List is updated to May of 1996.

U.S. EPA maintains this list under the Comprehensive Environmental Response Compensation and Liability Act of 1980 (CERCLA) 42 U.S.C. Section 9601 (1985). Once sites have been designated on the CERCLIS List, U.S. EPA uses its Hazard Ranking System (HRS) to determine potential risks to human health and the environment. Only those CERCLIS sites which present the greatest risk are added to the NPL, which qualifies the sites to receive CERCLA remedial funding.

The subject Property and surrounding sites within a one mile radius are not listed.

6.3.2. CERCLIS - List is updated to May of 1996.

Since 1982, U.S. EPA has developed and maintained lists of contaminated properties under the federal Superfund program pursuant to the Comprehensive Environmental Response Compensation and Liability Act of 1980 (CERCLA), 42 U.S.C. Section 9601 (1985). U.S. EPA discovers these sites from citizen reports, routine inspection of hazardous waste generators, treatment, storage and disposal facilities, and reporting requirements.

The subject Property and surrounding sites within a one mile radius are not listed.

6.3.3. U.S. EPA RESOURCE CONSERVATION AND RECOVERY ACT (RCRA) - GENERATORS OF HAZARDOUS MATERIALS - List is updated to May of 1996.

This database report contains information pertaining to facilities which generate hazardous waste. Information pertaining to the status of facilities tracked by the RCRA Administrative Action Tracking System (RAATS). The database is inclusive of, but not limited to: conditionally exempt small quantity generators, small quantity generators, and large quantity generators. Under the Resource Conservation and Recovery Act, the EPA compiles a list of generators of hazardous waste materials. Generators in this classification are required to have U.S. EPA I.D. numbers on all waste manifest disposal records.

No adjacent properties were listed as small or large quantity generators. The neighboring automotive repair facility is not listed as a small or large quantity generator.

6.3.4. U.S. EPA RESOURCE CONSERVATION AND RECOVERY ACT (RCRA) - TSD FACILITIES - List is updated to May of 1996.

This database report contains information pertaining to facilities which either treat, store, or dispose of hazardous waste. Information pertaining to the status of facilities is tracked by the RCRA Administrative Action Tracking System.

The subject Property and surrounding sites within a one mile radius are not listed.

6.3.5. EMERGENCY RESPONSE NOTIFICATION SYSTEM (ERNS) - List is updated to December of 1995.

ERNS is a national database and retrieval system of Incident - Notification information as initially reported. Reported incidences include releases of oil and hazardous substances. Information is recorded in an ERNS database when a release is initially reported to the federal government by any party. Most of the information in ERNS is comprised of initial notifications, supplying preliminary information on a release and are cited as unverified data.

The subject Property is not listed on the ERNS database.

6.3.6. UNDERGROUND STORAGE TANKS LISTING - List is current to August 1994.

The State of California Water Resources Control Board (WRCB) in Sacramento provides a list of all permitted underground storage tanks containing hazardous substances. This database provides information on all registered underground storage tanks.

The subject Property and immediately adjacent sites are not listed in the database as having underground storage tanks.

6.3.7. LEAKING UNDERGROUND STORAGE TANKS - List is updated to April of 1996.

The Regional Water Quality Control Board (RWQCB) provides a list of all leaks of hazardous substances from underground storage tanks (LUSTs). This database provides information on contamination case types. There are 37 LUST sites within a half mile radius of the Property.

1. The EmeryBay Market Place located at 6426 Christie Avenue is adjacent and upgradient to the subject Property. The site was not discussed in the previous report conducted in June, 1994 . Information in the file at the RWQCB was from 1988. This site was contiguous with the Neilsen truck site which is located approximately 400 hundred feet south of the subject Property. All underground fuel and waste oil tanks were removed in 1987. At the time the survey was conducted, there was visual evidence of monitoring wells on the EmeryBay Market Place Property. The monitoring wells were located approximately 300 feet southeast of the subject Property. Based upon the proximity of the site, groundwater gradient and the depth to groundwater, it is possible there has been an adverse environmental impact to the subject site.
2. King Knight Co. located at 6202 Christie Avenue is approximately .092 miles southeast and crossgradient to the Property. The site was closed fo further remediation by the local regulatory agency on June 9, 1993. It is not expected to negatively impact the Property.
3. Chiron located 4300 Eastshore Highway is approximately .166 miles southwest and downgradient to the Property. It is not expected to negatively impact the Property.
4. PIE Nationwide Property located at 5500 Eastshore Highway is approximately .183 miles northwest and downgradient to the Property. It is not expected to negatively impact the Property.
5. Emery Bay Plaza/Bayfront located at 1650 65th Street is approximately .204 miles northwest and crossgradient to the Property. It is not expected to negatively impact the Property
6. Peterson Manufacturing Co. located at 1600 63rd Street is approximately .207 miles northeast and crossgradient to the Property. It is not expected to negatively impact the Property
7. Bay Center Project located at 1665 65th Street is approximately .208 miles northwest and crossgradient to the Property. It is not expected to negatively impact the Property

8. Wetherford BMW located at 5903 Christie Avenue is approximately .233 miles southwest and crossgradient to the Property. The site was closed by local regulatory on March 31, 1993. It is not expected to negatively impact the Property.
9. Ryerson Steel & Aluminium located at 1465 65th Street is approximately .248 miles northeast and crossgradient to the Property. It is not expected to negatively impact the Property
10. Lowenberg Corporation located at 1410 64th Street is approximately .249 miles southwest and downgradient to the Property. This site was closed fo further remediation on January 1, 1996. It is not expected to negatively impact the Property.
11. Hollis Street Project located at 6050 Hollis Street is approximately .250 miles northeast and upgradient to the Property. A groundwater investigation was conducted at the site following removal of a 500-gallon underground fuel tank in 1987. The site is currently undergoing quarterly groundwater monitoring. Based upon sampling results and distance from the subject Property this site is not expected to negatively impact the Property.
12. US Post Office located at 6121 Hollis Street #8 is approximately .251 miles northeast and upgradient to the Property. No data was available in the file.
13. Post Office located at 1505 62nd Street is approximately .252 miles southeast and crossgradient to the Property. No data was available in the file. Based on distance and groundwater gradient it is not expected to negatively impact the Property.
14. Nielsen Property located at 5800 Shellmound Street is approximately .262 miles southeast and crossgradient to the Property. This site is contiguous to the Emeryville Market Place Property. Based upon the groundwater gradient it is not expected to negatively impact the Property.
15. Fire Station No. 2 located at 6303 Hollis Street is approximately .277 miles northeast and crossgradient to the Property. It is not expected to negatively impact the subject Property.
16. Hydraulic Electro Service Corp. located at 5812 Hollis Street is approximately .278 miles southeast and crossgradient to the Property. It is not expected to negatively impact the subject Property.

The remainder of the LUST sites are unlikely to negatively impact the subject Property based on groundwater gradient or distance.

6.3.8. SOLID WASTE INFORMATION SYSTEM (SWF) - List is updated to April of 1996.

The California Waste Management Board maintains this list pursuant to the Solid Waste Management and Resources Recovery Act of 1972. The list contains an inventory of active, inactive and closed solid waste disposal and transfer facilities.

The subject Property and surrounding sites within a half mile radius are not listed.

6.3.9. CAL-SITES (HWS) - List is updated to April of 1996.

The California Department of Health Services (CDHS) compiled this database pursuant to Section 253596 of the California Health and Safety Code. The list contains information on potential hazardous waste sites that have been identified by the Historical Abandoned Site Survey Program. The CDHS researched a portion of the various state environmental agencies that could possibly help identify potential hazardous waste sites. Once sites are confirmed as hazardous sites, they may be merged into the database of the Cortese List and/or the Bond Expenditure Program (BEP). Names may remain on this list even though a determination has been made that no leak had occurred or that the CDHS is requiring "No Further Action" to protect the environment or public health.

81 sites are listed within a one mile radius, 61 of which are reported as requiring "No Further Action." The remainder of the sites are either hydrogeologically down or crossgradient from the subject Property or were reported in a separate database. It is unlikely any HSW sites have adversely impacted the subject Property.

6.3.10. CALIFORNIA OIL AND GAS WELL REPORT

The California Oil and Gas Well data report contains location and production information for all regulated oil and gas wells in the State of California

The subject Property and sites within a quarter mile radius are not listed.

6.4. SITE HISTORY/LAND USE REVIEW

6.4.1. CITY OF EMERYVILLE BUILDING DEPARTMENT

The City Building Department files were researched for original building construction permits. No original building records are kept on file, however RGA notified the Alameda County Assessors Office and their files indicate that the building was constructed in 1966.

6.4.2. CITY ZONING DEPARTMENT

The Property is zoned M-U - Mixed Use District (see appendices for copies of commercial district restrictions).

6.4.3. FLOOD ZONING

Based on a conversation with Maurice Kaufman, Civil Engineer for the City of Emeryville, The Property is in Flood Zone C, which is defined as "areas of minimal flooding".

6.4.4. CITY FIRE DEPARTMENT

The Fire Department in the City of Emeryville was contacted by written request. No information has been received to date concerning the presence of registered underground storage tank(s) or hazardous materials releases on the Property. Any information received that alters the conclusions presented in this report will be forwarded as an addendum.

6.4.5. COUNTY HEALTH DEPARTMENT

The Alameda County Department of Environmental Health Services Department was contacted regarding any hazardous materials on the Property. In August, 1986 a spill of concrete sealer contain xylene and polymeric resin in water was reported. The material had spilled into the concrete dock ramp area below grade on the north side of the facility, accumulated in a double-chamber five-sided concrete sump about 2 feet deep. The material was then pumped onto the asphalt by an automatic sump pump. The water/spill mixture was cleaned by a hazardous waste contractor and a total of eight drums of hazardous waste were manifested and removed from the site.

6.5. STATE DEPARTMENT OF HEALTH SERVICES

The State Department of Health Services, Toxic Substance Control was contacted regarding hazardous waste or hazardous substance releases at the subject Property. No records of reported toxic substance releases on the subject Property have been received from DHS.

6.6. PREVIOUS ENVIRONMENTAL INVESTIGATIONS

A previous environmental investigation was conducted on the Property by Tetra Tech in May, 1994. The conclusions of the previous report were:

- "No obvious signs of surface contamination, such as soil discoloration, dead vegetation, surface spills, or poor housekeeping were found within the subject Property."
- "Regulatory agency sites were identified within the vicinity that may have an effect on soil or ground water at the subject Property."

6.7. COMPREHENSIVE ASBESTOS SURVEY

Interior building materials include cove siding and drywall and associated joint compound. The subject Property was extensively remodeled in 1994, therefore it is extremely unlikely that any asbestos containing building materials were used as a part of the renovation activities.

6.8. PCBS

Light ballasts associated with fluorescent fixtures installed or replaced prior to 1979 may contain PCBs. Based upon the renovation dates of 1994, it is unlikely that light fixtures observed during the building survey contain PCB's. There was no evidence of pad-mounted transformers on the Property.

6.9. RADON

The Department of Environmental Health was contacted regarding radon concentrations in the city of Emeryville. There have been no reported cases of exposure to elevated levels of radon.

The EPA's Map of Radon Zones in California lists the Alameda County area as having average concentrations ranging between 2.0 and 4.0 picocuries per liter pCi/L. Currently the U.S. EPA recommends taking remedial action if the levels exceed 4.0 pCi/L.

7. CONCLUSIONS AND RECOMMENDATIONS

On September 27, 1996 JoAnn Copperud of RGA conducted an Environmental Site Investigation at 6390 Christie Avenue in Emeryville, California. The purpose of the inspection was to determine the potential for hazardous or toxic substance contamination originating from, or migrating to, the subject Property.

- An adjacent upgradient site is listed as a fuel release site. At the time the survey was conducted there was visual evidence of monitoring wells located approximately 300 feet southeast of the subject Property. Based upon distance, groundwater gradient and depth to groundwater it is possible there has been an adverse environmental impact to the subject Property.
- An adjacent site is currently used for automotive repair. At the time the survey was conducted, there was visual evidence of drums containing unknown quantities or types of materials and areas of visible staining. The Property is not listed as a small quantity hazardous waste generator. Work practices at the adjacent site could have an adverse environmental impact on the subject Property, however nothing was observed on the day of the survey.

- The subject Property is located in an area which has historically been used for industrial purposes.
- The subject Property has been developed since 1966. The building was extensively renovated in 1994.
- At the time of the survey, there was no known pending environmental regulatory action concerning the subject Property.
- Visual inspection and observation made at the subject site did not reveal the presence of urea formaldehyde insulation; drums containing unknown quantities or types of hazardous or solid wastes; material spills; chemicals or other raw materials; pits or sumps; stressed vegetation; unusual or noxious odors; on-site storage tanks, oil wells, disposal wells, dry wells or monitoring wells. There was no sign of unusual discharges, discolored flowing or ponded water, cisterns, septic tanks, or unnatural fill.

8. LIMITATIONS

The conclusions presented in this report are professional opinions based on the data described in this report. They are intended only for the subject site, and apply only to conditions existing at the time of our study. This report does not provide the level of detail necessary to be utilized for structural demolition or remodeling, or soil or ground water remediation. All analyses are based upon available information.

Changes in applicable standards can occur as the result of legislation or broadening knowledge which may invalidate, wholly or in part, the findings of this report. This report may contain records or database information mis-identified by federal, state, or local agencies. RGA is not responsible for database or record errors or omissions.

California Health and Safety Code requires that information be given regarding commercial and public buildings in which asbestos-containing materials are known to be present. Under this law, owners of such buildings may be required to notify their employees and contractors who work in those buildings of the asbestos-containing materials found within, and may be required to send a copy of the notice to tenants, subtenants and others with whom such owners are in contact.

The reader should be aware that the strict interpretation of the Federal Comprehensive Emergency Response and Compensation Liability Act (CERCLA) and case law may hold the landowner responsible for any toxic liability including future cleanup costs. This statement is not motivated by any condition of the subject Property but as a general statement of the advisability that Property owners and purchasers exercise all appropriate precautions to hazardous materials risks.

ERIIS DISCLAIMER

The information contained in this report has been obtained from publicly available sources and other secondary sources of information produced by entities other than Environmental Risk Information & Imaging Services (ERIIS). Although great care has been taken by ERIIS in compiling and checking the information contained in this report to insure that it is current and accurate, ERIIS disclaims any and all liability for any errors, omissions, or inaccuracies in such information and data, whether attributable to inadvertence or otherwise, and for any consequences arising therefrom. The data provided hereunder neither purports to be nor constitutes legal or medical advice. It is further understood that ERIIS MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND, INCLUDING, BUT NOT LIMITED TO, THE WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE OF MERCHANTABILITY, NOR ANY SUCH REPRESENTATIONS OR WARRANTIES TO BE IMPLIED WITH RESPECT TO THE DATA FURNISHED, AND ERIIS ASSUMES NO RESPONSIBILITY WITH RESPECT TO CUSTOMER'S, ITS EMPLOYEES', CLIENTS', OR CUSTOMERS' USE THEREOF. ERIIS SHALL NOT BE LIABLE FOR ANY SPECIAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES RESULTING, IN WHOLE OR IN PART, FROM CUSTOMER'S USE OF THE DATA. Liability on the part of the Environmental Risk Information & Imaging Services (ERIIS) is limited to the monetary value paid for this report. The report is valid only for the geographical parameters specified on the cover page of this report, and any alteration or deviation from this description will require a new report. This report does not constitute a legal opinion.

ERIIS REPORT OVERVIEW

The following features are available for an ERIIS report:

- * Database Report
 - * Statistical Profile
 - * Database Records
- * Related Maps
 - * Digital Custom Plotted Map
 - * Sanborn Fire Insurance Map(s)
 - * Topographical Map(s)

Statistical Profile

The statistical profile is an at-a-glance numeric summary of the databases searched for your ERIIS Report.

Database Records

The detailed federal and state database information indicates potential and actual environmental threats within the study radius. These records are sorted by their distance from the study site.

Digital Custom Map

The digital custom map is cross referenced with the database records. The cross-in-circle in the center of the map represents the study site. The red circles represent distances from the study site. The plottable sites in the report are distinguished on the map by symbols of different shape and color.

Historic Fire Insurance Maps

The ERIIS collection of historical Sanborn Fire Insurance Maps covers 14,000 cities and towns. These maps may indicate prior use of the study site. If no maps are available for the study site, a notice to that effect is included. This notice should serve as evidence of due diligence.

Topographical Map

USGS topographical maps show natural and man-made features as well as the shape and elevation of the terrain. The 7.5 minute quad maps are produced at a scale of 1:24,000, or one inch represents 2,000 feet.

Radon Zone Level: 2

Zone 2 has a predicted average indoor screening level ≥ 2 pCi/L and ≤ 4 pCi/L

A Radon Zone should not be used to determine if individual homes need to be tested for radon. The EPA's Office of Radiation and Indoor Air (202/233-9320) recommends that all homes be tested for radon, regardless of geographic location or the zone designation in which the property is located.

**A property is defined as a .05 mile buffer around the site's latitude and longitude.

A blank radius count indicates that the database was not searched by this radius per client instructions.

NR in a radius count indicates that the database cannot be reported by this search criteria due to insufficient and/or inaccurate addresses reported by a federal/state agency.

DATABASE REFERENCE GUIDE

NPL

Date of Data: 05/01/1996
Release Date: 05/13/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
703/603-8881

National Priorities List

The NPL Report, also known as the Superfund List, is an EPA listing of uncontrolled or abandoned hazardous waste sites. The list is primarily based upon a score which the site receives from the EPA's Hazardous Ranking System. These sites are targeted for possible long-term remedial action under the Superfund Act of 1980.

RCRIS TS

Date of Data: 05/10/1996
Release Date: 06/10/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
202/260-4610

Resource Conservation and Recovery Information System - Treatment, Storage, And Disposal Facilities

The RCRIS TS Report contains information pertaining to facilities which either treat, store, or dispose of EPA regulated hazardous waste. The following information is also included in the RCRIS TS Report:

- Information pertaining to the status of facilities tracked by the RCRA Administrative Action Tracking System (RAATS)
- Inspections & evaluations conducted by federal and state agencies
- All reported facility violations, the environmental statute(s) violated, and any proposed & actual penalties
- Information pertaining to corrective actions undertaken by the facility or EPA
- A complete listing of EPA regulated hazardous wastes which are generated or stored on-site

CERCLIS

Date of Data: 05/01/1996
Release Date: 05/13/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
703/603-8730

Comprehensive Environmental Response, Compensation, and Liability Information System

The CERCLIS Database is a comprehensive listing of known or suspected uncontrolled or abandoned hazardous waste sites. These sites have either been investigated, or are currently under investigation by the U.S. EPA for the release, or threatened release of hazardous substances. Once a site is placed in CERCLIS, it may be subjected to several levels of review and evaluation, and ultimately placed on the National Priorities List (NPL). As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from the CERCLIS Database.

NFRAP

Date of Data: 05/01/1996
Release Date: 05/13/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
703/603-8881

No Further Remedial Action Planned Sites

The No Further Remedial Action Planned Report (NFRAP), also known as the CERCLIS Archive, contains information pertaining to sites which have been removed from the U.S. EPA's CERCLIS Database. NFRAP sites may be sites where, following an initial investigation, either no contamination was found, contamination was removed quickly without need for the site to be placed on the NPL, or the contamination was not serious enough to require federal Superfund action or NPL consideration.

RCRIS LG

Date of Data: 05/10/1996
Release Date: 06/10/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
202/260-4610

Resource Conservation and Recovery Information System - Large Quantity Generators

The RCRIS LG Report contains information pertaining to facilities which either generate more than 1000kg of EPA regulated hazardous waste per month, or meet other applicable requirements of the Resource Conservation And Recovery Act. The following information is also included in the RCRIS LG Report:

- Information pertaining to the status of facilities tracked by the RCRA Administrative Action Tracking System (RAATS)
- Inspections & evaluations conducted by federal and state agencies
- All reported facility violations, the environmental statute(s) violated, and any proposed & actual penalties
- Information pertaining to corrective actions undertaken by the facility or EPA
- A complete listing of EPA regulated hazardous wastes which are generated or stored on-site

RCRIS SG

Date of Data: 05/10/1996
Release Date: 06/10/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
202/260-4610

Resource Conservation and Recovery Information System - Small Quantity Generators

The RCRIS SG Report contains information pertaining to facilities which either generate between 100kg and 1000kg of EPA regulated hazardous waste per month, or meet other applicable requirements of the Resource Conservation And Recovery Act. On advice of the U.S. EPA, ERIIS does not report so-called "RCRA Protective Filers." Protective Filers, commonly called Conditionally Exempt Small Quantity Generators (CESQG's), are facilities that have completed RCRA notification paperwork, but are not, in fact, subject to RCRA regulation. The determination of CESQG status is made by the U.S. EPA. The following information is also included in the RCRIS SG Report:

- Information pertaining to the status of facilities tracked by the RCRA Administrative Action Tracking System (RAATS)
- Inspections & evaluations conducted by federal and state agencies
- All reported facility violations, the environmental statute(s) violated, and any proposed & actual penalties

ENVIRONMENTAL RISK INFORMATION & IMAGING SERVICES
DATABASE REFERENCE GUIDE

- Information pertaining to corrective actions undertaken by the facility or EPA
- A complete listing of EPA regulated hazardous wastes which are generated or stored on-site

DOCKET

Date of Data: 07/23/1996
Release Date: 08/06/1996
US Environmental Protection Agency
Office of Enforcement
202/564-4114

Civil Enforcement Docket

The Civil Enforcement Docket is the U.S. Environmental Protection Agency's system for tracking civil judicial cases filed on the Agency's behalf by the U.S. Department Of Justice. This report contains information on cases from 1972 to the present.

TRI

Date of Data: 12/31/1992
Release Date: 05/01/1994
US Environmental Protection Agency
Office of Pollution Prevention and Toxics
202/260-3757

Toxic Release Inventory System of 1992

The TRI Report contains information concerning the industrial release and/or transfer of toxic chemicals as reportable under Title III of the Superfund Amendments And Reauthorization Act Of 1986 (SARA Title III).

FRDS

Date of Data: 10/28/1994
Release Date: 10/31/1994
US Environmental Protection Agency
Office of Water/National Data Processing
202/260-2805

Federal Reporting Data System

The Federal Reporting Data System Report contains summary information pertaining to all public water supply wells and their associated treatment facilities. The latitude and longitude information which ERIS uses to plot the FRDS facilities is based upon information provided to the U.S. EPA, and may not reflect the actual physical locations of the wells.

ERNS

Date of Data: 12/31/1995
Release Date: 03/18/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
202/260-2342

Emergency Response Notification System - 1995

ERNS is a national computer database system that is used to store information concerning the sudden and/or accidental release of hazardous substances, including petroleum, into the environment. The ERNS Reporting System contains preliminary information on specific releases, including the spill location, the substance released, and the responsible party. Please note that the information in the ERNS Report pertains only to those releases that occurred between January 1, 1995 and December 31, 1995.

FINDS

Date of Data: 05/10/1996
Release Date: 06/10/1996
US Environmental Protection Agency
Office of Information Resources Management
800/908-2493

Facility Index System

The FINDS Report is a computerized inventory of all facilities that are regulated or tracked by the U.S. Environmental Protection Agency. These facilities are assigned a unique identification number which serves as a cross-reference for other databases in the EPA's Program System. Each FINDS record indicates the EPA Program Office which is responsible for the tracking of the facility.

OPENDUMP

Date of Data: 01/01/1990
Release Date: 01/01/1991
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
202/260-4687

Open Dumps Report

The Resource Conservation and Recovery Act defines the term "Open Dump" to mean "...any facility or site where solid waste is disposed of which is not a sanitary landfill which meets the criteria promulgated under Section 4004 and which is not a facility for the disposal of hazardous waste." Thus, any facility which fails to comply with any one element of the criteria is considered to be an Open Dump.

NUCLEAR

Date of Data: 01/01/1993
Release Date: 02/01/1993
US Nuclear Regulatory Commission
Permits Section
301/415-7876

Nuclear Power Facilities

The Nuclear Report is a comprehensive listing of all licensed and active nuclear power plants in the United States.

HWS

Date of Data: 04/13/1996
Release Date: 04/30/1996
CA Dept. of Toxic Substances Control
Site Mitigation Branch/CalSites
916/323-3400

California Calsites

The California CalSites Report contains information pertaining to potentially contaminated hazardous waste sites. Sites formerly listed in the Annual Workplan (AWP), the Abandoned Sites Project Information System (ASPIS), and the Bond Expenditure Plan (BEP) are now included in the CalSites Database. Of the 26,000+ sites listed within CalSites, approximately 16,000 sites are listed as "No Further Action". Further, only about 300+ sites listed within the CalSites database are confirmed and active hazardous substance release sites.

Unplottable Sites

The remaining report pages list additional environmental sites that have been selected based on geographic criteria unique to your study site. They are classified as "unplottable sites" and require further investigation to assess their potential impact on your site.

How to Evaluate Unplottable Sites

Step 1

Streets Within the Radius: the following page is an alphabetical index of all streets that intersect or are contained within the largest study radius (usually one mile).

Step 2

Cross-Reference: use the "Streets Within the Radius" index to cross-reference the unplottable sites. For example, if Maple Avenue and Oak Avenue are listed in the street index, then any unplottable sites with a Maple Avenue or Oak Avenue address should be checked for possible impact on study site.

Questions on ERIIS' Proprietary Geocoding?

We're happy to answer any questions you might have about our data processing and **point-geocoding** (assigning a latitude and longitude to each address). Just give us a call on our toll-free number at (800) 989-0402 and let us know what state you're calling from. Our customer service staff is available from 8 a.m. to 8 p.m. (EST).

The ASTM Standard Practice For Environmental Site Assessments

As stated in the recently published **Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process** (E1527) by the American Society for Testing and Materials (ASTM):

"For large databases with numerous facility records (such as RCRA hazardous waste generators and registered underground storage tanks), the records are not practically reviewable unless they can be obtained from the source agency in the smaller geographic area of ZIP code (3.3.24)."

Therefore, this Report contains information available by latitude/longitude or by ZIP code.

If your research requires environmental records for which only city or county information is available (i.e., no valid street or ZIP code) ERIIS will include this data at no extra charge.

ZONING INFORMATION

ARTICLE 9-4.36

M-U MIXED USED DISTRICT

Sections:

9-4.36.1	Title and Purpose.
9-4.36.2	Uses: Permitted.
9-4.36.3	Uses: Subject to Conditional Use Permit.
9-4.36.4	Uses: Accessory.
9-4.36.5	Uses: Type of Structures.
9-4.36.6	Standards: Density/Intensity.
9-4.36.7	Standards: Height.
9-4.36.8	Standards: Yards and Coverage.
9-4.36.9	Standards: Landscaping, Buffering, and Screening.
9-4.36.10	Standards: Off-Street Parking and Loading.
9-4.36.11	Standards: Special Provisions.
9-4.36.12	Standards: Mixed Uses.
9-4.36.13	Standards: Live/Work Space.
9-4.36.14	Standards: Performance.
9-4.36.15	Standards: Signs.
9-4.36.16	Procedures: General.

Section 9-4.36.1 Title and Purpose. Article 9-4.36 establishes the Mixed Use District, also known as the M-U District, and prescribes use types and other regulations for this district. Any applicable overlay districts described in Articles 9-4.40 through 9-4.49 may impose regulations in addition to those for this district. The purpose of the regulations for this district is to implement policies contained in the Community Development component of the General Plan, particularly policies prescribed by the Mixed Use land use category.

Section 9-4.36.2 Uses: Permitted. The following use types shall be permitted:

- (a) Residential. None.
- (b) Civic. Essential Services.
- (c) Commercial. None.
- (d) Industrial. None.

Section 9-4.36.3 Uses: Subject to Conditional Use Permit. The following types shall be permitted subject to obtaining a conditional use permit:

- (a) Residential. Family Residential:
Two-Family
Multi-Family
Group Residential

- (b) Civic. Administrative Services
Community Education
Community Recreation
Convalescent Services
Cultural and Library Services
Day Care Services: Day Care Center
Group Care
Hospital Services
Major Public Services
Park and Recreation
Public Parking Services
Religious Assembly

Section 9-4.36.4 Uses: Accessory. Accessory uses and structures are subject to the provisions of Article 9-4.5.

Section 9-4.36.5 Uses: Type of Structures.

- (a) Open Storage. All open storage shall require a conditional use permit pursuant to Article 9-4.82.
- (b) Drive-In Facilities. All drive-in facilities shall require a conditional use permit pursuant to Article 9-4.82.
- (c) Multi-Tenant Facilities. All multi-tenant facilities shall require a conditional use permit pursuant to Article 9-4.82.

Section 9-4.36.6 Standards: Density/Intensity.

- (a) Floor-Area Ratio. The floor area ratio of building(s) other than dwellings shall be as prescribed on the adopted Building Intensity map.
- (b) Residential Density. The maximum allowable number of dwelling units per gross acre in this district shall be forty-five (45); provided, however, that the density may be increased to sixty (60) with a conditional use permit pursuant to Article 9-4.82.
- (c) Minimum Building Site Area. There is no minimum building site area in the M-U District.

Section 9-4.36.7 Standards: Height.

- (a) Maximum Building Height. The height of buildings and structures in this district shall be as prescribed on the adopted Building Height map.

- (b) General Requirements. The general requirements for height of buildings and structures are contained in Article 9-4.52.

Section 9-4.36.8 Standards: Yards.

- (a) General Requirements. The requirements for yards in this section shall be in addition to the general yard requirements contained in Article 9-4.53.
- (b) Yards. Front, side, and rear yards shall not be required in the Mixed Use (M-U) District, except as follows:
- (1) Where the side of a lot abuts property in a residential district (R-M or R-H), the side yard shall not be less than ten (10) feet, plus an additional two (2) feet of setback shall be required for each one (1) foot by which the height of the building on the commercial lot exceeds three (3) stories.
 - (2) Where the rear of a lot abuts property in a residential district, the rear yard shall be not less than ten (10) feet, plus an additional two (2) feet of setback shall be required for each one (1) foot by which the height of the building on the commercial lot exceeds three (3) stories.
 - (3) Where the street frontage of a lot is adjacent to property in a residential district, the front yard depth or side yard width on the street side adjacent to the residential district shall be not less than that required for the residential district.
 - (4) Where a lot has frontage on two (2) streets, and both such frontages are adjacent to property in a residential district, the front yard depth and the side yard width on the street sides adjacent to the residential district properties shall be not less than those required for the adjacent residential district.

Section 9-4.36.9 Standards: Landscaping, Buffering, and Screening. Landscaping, buffering and screening shall be provided pursuant to the provisions of Article 9-4.54.

Section 9-4.36.10 Standards: Off-Street Parking and Loading. Off-street parking and loading shall be provided pursuant to the provisions of Article 9-4.55.

Section 9-4.36.11 Standards: Special Provisions. Access to all off-street parking and loading areas shall conform with requirements of the City Engineer and shall be subject to modification during review of the site plan.

Section 9-4.36.12 Standards: Multiple Uses. The standards for multiple-use development are contained in Article 9-4.57.

Section 9-4.36.13 Standards: Live/Work Space. The standards for live/work space are contained in Article 9-4.58.

Section 9-4.36.14 Standards: Performance. All development shall be subject to the performance standards as set forth in Article 9-4.59.

Section 9-4.36.15 Standards: Signs. The standards for signs are contained in Article 9-4.61.

Section 9-4.36.16 Procedures: General. The procedures for obtaining permits and other approvals are contained in Articles 9-4.80 through 9-4.99.

RECEIVED
AUG 18 1986
HAZARDOUS MATERIALS/
WASTE PROGRAM

August 14, 1986

Spill Response Report of August 13, 1986

Site: Fuller Brush Co. 6390 Christie Ave. Emeryville. CA
Material: Concrete sealer containing xylene and polymeric resin
in water.

The material had spilled into the concrete dock-ramp area below grade on the north side of the facility, accumulated in a double-chamber five-sided concrete sump about 2 feet deep and had then been pumped out onto the asphalt by the automatic sump pump.

Zero Waste Systems absorbed and cleaned up the water/spill mixture which had accumulated behind dykes of absorbent (installed by the Fire Department). We scraped up the thicker clumps of material which we thought might not evaporate to dryness, and swept and scrubbed up as much of the dried material as possible.

The storm drain in the parking lot contained about 6 inches of dirt which was contaminated with the xylene/resin mixture. We shovelled out the dirt, scraped the drain clear and cleaned the grate of dirt held up in the grid. The storm drain in the street was flowing with water and seemed to contain no significant residue, so it was left undisturbed.

The heaviest contamination was in the below grade ramp and the sump. The sump had floating concrete sealer in the pump chamber. This was bucketed out and solidified with the approximately 4 gals. of remaining product in the 5 gal. cans plus the crushed empty cans. The sump contents were then pumped out and solidified, the grates cleaned of dirt and the concrete scraped and scrubbed on the ramp and in the sump. The ramp area was then water-blasted into the sump and the walls of the sump then repeatedly water blasted and pumped out until no further concrete sealer was evident.

The area which the sump-pump out let pumped into was also water-blasted. All water, scrapings debris etc. was solidified with absorbent, drummed and manifested. The sump appears to continuously fill with subsurface water, filling up about every 16 hours or so. This leads us to conclude that there is no possible

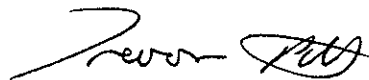

Page 2
Spill Response
August 14, 1986

groundwater contamination due to the spill. The sump water appears clean and odor-free as of 9:00 a.m. August 14, 1986.

On Alameda County Health Department advice, we informed Fuller Brush Co. that the remaining thin film of dried resin was non-hazardous and could be cleaned up with brushes, and that the electric sump pump could be turned back on. A total of eight drums of hazardous waste were generated and manifested (copy enclosed) and will be shipped today to the Casmalia disposal site. The cleanup total cost was approximately \$4,200.00. We found that Fuller Brush Co. was entirely helpful and cooperative. They did not understand the nature of the chemicals spilled or the environmental and legal implications of its entry into storm sewers or onto land surfaces.

Sincerely,

ZERO WASTE SYSTEMS by

Dear JoAnn Copperud:

Subject: Your Letter Dated **September 15, 1996** regarding property located at **6390 Christie Avenue, Emeryville, CA 94608**

Upon reviewing the Department's calendar for routine file searches it was determined that the Department will be able to provide your organization the file(s) for your review on **September 26, 1996** at **9:00 AM**. The file(s) will be available for review at the following address:

County of Alameda
Environmental Health Services
1131 Harbor Bay Parkway
Suite No. 250
Alameda CA 94502

If it is necessary for you to have access to the requested file(s) prior to the date and time indicated above, the Department may, subject to staff availability, be able to provide Technical Consultation Services. The fees currently charged by the Department for file searches are contained in the enclosed Departmental Public Records Search Policy.

Should you desire to schedule the file search prior to the date and time indicated above, please contact me in writing at the address indicated above or via FAX at (510) 337-9335.

Very truly yours,

Juliette Blake
File Search Coordinator

ALAMEDA COUNTY
DEPARTMENT OF ENVIRONMENTAL HEALTH

Public Records Search Policy

The following will be policy of the Department of Environmental Health regarding requests to inspect public records.

When the Department receives inquiry about a file, the requestor will be informed that they have the option of requesting an inspection of our files at a date and time established by the Department at no cost, or technical consultation of the record in question by the specialist assigned to the project. If the requestor wishes to only inspect the files, the Department will provide file oversight by clerical support staff and no technical answers will be provided. If a technical consultation is requested, the Department will make a Project Specialist available at a mutually agreed upon date and time to answer questions and explain the materials. The Project Specialist may also certify in writing, as appropriate, as to the completeness of the Departmental file(s) in question. The requestor should send the Department a letter stating their preferred method of file inspection and the authorizing of the appropriate fees, if any. Both public record's inspection and technical consultation may be limited or delayed by the availability of staff.

FEES:

The following fees will be assessed according to the request:

- (1) **For Inspecting a File . . .** No Fee
- (2) **For Copies:** Ten cents (\$0.10) per page for the reproduction of documents of 8.5" x 11" or 8.5" x 14". Reproduction charges for oversized documents (larger than 8.5" x 14") or any other copy media will be equivalent to the direct cost of duplication. Copy requests in excess of twenty (20) pages may be subject to a reasonable delay.
- (3) **For Technical Consultation** or any explanation of any materials in the file, a charge of \$94.00 per hour, or fraction thereof.

REQUESTS:

All requests should be submitted in writing and sent to:

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

CERCLIS-NFRAP: As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund Action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

A review of the CERC-NFRAP list, as provided by EDR, and dated 08/10/2004 has revealed that there is 1 CERC-NFRAP site within approximately 0.25 miles of the target property.

RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous

EXECUTIVE SUMMARY

waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRIS-LQG list, as provided by EDR, and dated 08/10/2004 has revealed that there is 1 RCRIS-LQG site within approximately 0.25 miles of the target property.

BROWNFIELDS DATABASES

VCP: Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

A review of the VCP list, as provided by EDR, and dated 10/05/2004 has revealed that there are 4 VCP sites within approximately 0.5 miles of the target property.

Background Info : The Transo/Lacoste Site was the former location of the Transo Envelope Company (Transo) and the Lacoste Meat Company (Lacoste). Transo occupied 1600 64th Street and was an envelope manufacturing facility in the early 1900's. Lacoste occupied 6401 Bay Street and was a slaughter house and meat packing facility in the early 1900's. The City of Emeryville purchased both properties in 1990 as part of the Bay Street-Shellmound Street Extension Project. Both facilities were located at the corner of 64th Street and Bay Street in Emeryville. The two buildings were demolished in February and March 1990 by the City of Emeryville Redevelopment Agency. The City redeveloped the Site as the EmeryBay II Apartments. Groundwater underneath the Site was discovered to be contaminated by lead, oil and grease in June 1991. Groundwater monitoring took place and a passive soil venting system was installed beneath the concrete parking garage slab of EmeryBay II.

Background Info :	<p>The site was construction of a new city street utilizing existing segments of Shellmound Street and a new overhead bridge structure in the City of Emeryville.</p> <p>Not reported</p> <p>The 40th Street overhead bridge construction required excavation of contaminated soils in 1995. Approximately 300 cubic yards of soils were excavated and disposed off-site. The remaining 5,700 cubic yards were encapsulated within an 18-inch thick clay blanket within the embankment and an additional 2 to 5 feet of clean fill was placed on top.</p> <p>Not reported</p> <p>Phase II of Shellmound project covered the construction of a surface street. Soil was contaminated with metals, PCBs petroleum hydrocarbons, and volatile and semi-volatile organics. About 8000 cubic yards of soil were excavated and treated on-site with dry reagents and an asphaltic emulsion mixture on-site. The treated soil was used as roadway. Approximately, 113,000 gallons of groundwater were collected, treated and disposed to the sanitary sewer. This removal took place in 1996.</p> <p>Not reported</p> <p>A deed restriction was recorded on June 28, 1996 limiting use of street and prohibits soil disturbance without an approved Soil Management Plan.</p>

Address(es) : 4300 EASTSHORE HIGHWAY
 EMERYVILLE, CA 94560

Background Info : The site was a former steel manufacturing plant which was operated over 100 years by Judson Steel and Barbary Coast Steel Corporation. These operations resulted in the contamination of the soil and groundwater with metals, total petroleum hydrocarbons (TPH), and PCBs.
 Not reported
 Caltrans took ownership of a strip of the property as part of the overall new highway construction related to the Cypress project. Caltrans and East Bay Municipal Utility District relocated a major sewerline and constructed a new concrete double box culvert. The construction of these two structures required excavation through contaminated soils.
 Not reported
 Soils with lead over 5,000 ppm or TPH over 1,000 ppm were hauled off for proper disposal off-site. Lower level contaminated soil was used as backfill material and was covered over with two feet of clean soil. Any groundwater encountered was treated and disposed by sewer. Groundwater remediation is covered under the Barbary Coast remediation.

 Background Info : The site is a roadway construction project undertaken by the City of Emeryville. A new city street was constructed from 64th Street to Shellmound Street. This area was formerly a tideland and marshland. Random filling with soil mixed with industrial wastes and various debris took place historically. Sampling results revealed the presence of petroleum hydrocarbons, metals, PCBs and polycyclic aromatic hydrocarbons. Contaminated soil was excavated and disposed off-site. The completed roadway acts as a cap to prevent exposure to residual levels of contaminated soil. A deed restriction was recorded limiting future use to roadway.

BEP:

Site Description : This site is a two acre, undeveloped and vacant area lying directly west of the Westinghouse Electric Company facility. Operations at this facility included maintenance and repair of electrical apparatus, including transformers containing polychlorinated biphenyls (PCB) fluids. In the course of maintenance, some of these liquids leaked on, or were discharged to the site.

Hazardous Waste Desc : The principal contaminant on the site is PCB.

Threat To Public Health & Env : The concerns for human health are primarily those of direct contact. The Westinghouse site is in an industrial area and, subsequent to the findings of PCB contamination, was fenced to exclude trespassers. A mainline, fenced, railroad right of way also secures the site from trespassers. Offsite contamination at an adjacent property has been identified by DHS sampling. The extent of offsite contamination has not been defined.

Site Activity Status : EPA assumed the lead responsibility in April, 1981 for the characterization of the site and the development and implementation of a remedial action for the site with advisory roles by DHS and the RWQCB. The remediation consisted of containment of soil and ground water contamination by means of an "engineered cap" and a slurry wall. The RWQCB issued cleanup and abatement order No. 85-006, dated January 21, 1985, pertaining to the prevention of soil movement from the site by surface water runoff control. Additional remedial investigation is currently ongoing because PCB contamination was discovered in a building onsite and along a railroad spur track between Westinghouse and an adjacent property. DHS has not scheduled this site for activity at this time. Any DHS assistance is expected to be limited. If more extensive assistance by DHS is necessary, then advance funding will need to be secured.

Project Revenue Source Co. : Not Reported
 PRS Company Address : Not reported
 Not reported

Project Revenue Source Desc : This site is projected for cleanup funded by responsible parties with reimbursement to DHS for staff and related costs. However, if the responsible parties fail to provide funding for cleanup another source of funds will need to be established.

Responsible Party : BACKLOG SITE CLEANUP PLANNING REPORT

FORMER INDUSTRIAL HARD CHROME (Continued)

S105557579

Background Info : Site was occupied by a hard chrome plating company from 1948 to 1962. Hazardous waste generated at the site included chromic and sulfuric acid solutions with heavy metals. Latham Engineering is reported to have managed the wastes. The facility used a waste chrome recovery system and a neutralization system. Storage and disposal methods are not known. In 1958, a reported spill occurred on the property where contamination entered the storm drain and resulted in low pH levels in the City's sewer effluent water. The quantity and extent of spill is not known.

Agency Type: Not reported
 Waste Type: Not reported
 Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
 Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
 Reclamation: Not reported
 POTW: Not reported

 Actvty Deleted Via Commitmnt/Completns Screen : Not reported
 Special Program Code: CERC2
 Special Program : CERCLA II
 Comments Date : 01011992
 Comments : DTSC needs to determine current site status.
 Site Screening Done: Two 5000-gallon diesel tanks and a waste oil tank removed by 11/20/86. Another 5000-gallon tank was removed in the '70s. Removal of 2600 cubic yards of soil. On site soil undergoing aerobic degradation. Recommend Preliminary Assessment due to need for information on ground water contamination.
 Preliminary Assessment Done: Eight underground tanks removed. One diesel and one waste oil tank had leaked. Gas tank spill had occurred in the '70s. On-site aeration of 7000 cubic yards of soil. Shopping mall built on site. Additional contamination found in the southern part of the site. Hazardous waste contamination is migrating. Preliminary Assessment submitted to EPA. NFA under CERCLA2. This Site is under Alameda County Health Dept. oversight. Because groundwater TPH plume is flowing off-site onto the Shellmound Ventures Property, DTSC is reviewing clean-up proposals.
 Self-Monitoring: Eight soil borings drilled to determine quantity and extent of diesel and other petroleum products in soil and groundwater. RWQCB is the lead agency.
 Self-Monitoring: Soil borings converted to monitoring wells.
 Sample Results: Five borings showed total fuel hydrocarbons greater than 1000 ppm (reported 08/11/86).

Relative: Higher BEP:
 Site Description : This site, which has been in operation since the early 1920s, is a Pacific Gas and Electric's Materials Distribution Center. The site has served as a warehouse, repair shop and storage yard for transformers, capacitors and other electrical supplies. A tank farm for the storage of fuel and transformer oil is also present on the site. The facility covers approximately two city blocks of an area which is generally industrialized.
 Hazardous Waste Desc : The soil is contaminated with polychlorinated biphenyls (PCBs) and lead, which is present at very high concentrations in localized areas. The ground water is contaminated with heavy metals that may have originated from the site.
 Threat To Public Health & Env : Direct contact with soil is unlikely; the site is completely fenced. Two ground water wells present on the site have been abandoned. There is no known use of the ground water for drinking water supply or for industrial uses.
 Site Activity Status : More PCB contamination has been found as the result of recent soil sampling. PG&E plans to modify their removal action plan, accordingly. If the cleanup costs are less than \$250,000, DHS will exempt the site from the formal RAP requirements.
 Project Revenue Source Co. : Not Reported
 PRS Company Address : Not reported
 Project Revenue Source Desc : DHS will be issuing a remedial action order or entering into an enforceable agreement with the responsible parties. DHS has budgeted \$50,000 for oversight/monitoring of cleanup efforts. DHS will recover 100 percent of

Site Description : This site is plating facility which previously disposed of chromium waste to shallow wells onsite.

Hazardous Waste Desc : Hexavalent chromium has been detected in the subsurface soil and the ground water.

Threat To Public Health & Env : This is a small site and the public health threat posed by the site is believed to be minimal. The site, which is located in an industrial area, is paved and has restricted access. There is salt water intrusion in the area and ground water is not used for drinking.

Site Activity Status : Phase I soil and ground water sampling has been completed. Phase II sampling has not been initiated because the company declared bankruptcy. This site has been placed in the backlog due to the relatively low public health/environmental hazard.

Project Revenue Source Co. : Not Reported

PRS Company Address : Not reported

Project Revenue Source Desc : This site is projected to be remediated by the responsible parties with reimbursement to DHS for its oversight and monitoring costs. However, if the responsible parties are unable to fund the remediation activities, another source of funds will need to be identified.

Responsible Party : BACKLOG SITE CLEANUP PLANNING REPORT

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List

Source: EPA

Telephone: N/A

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

Source: EPA

Telephone: 703-413-0223

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Source: EPA

Telephone: 703-413-0223

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

RCRIS: Resource Conservation and Recovery Information System

Source: EPA
Telephone: 800-424-9346

Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

UMTRA: Uranium Mill Tailings Sites

Source: Department of Energy
Telephone: 505-845-0011

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

RAATS: RCRA Administrative Action Tracking System

Source: EPA
Telephone: 202-564-4104

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 09/07/04
Date of Next Scheduled EDR Contact: 12/06/04

TRIS: Toxic Chemical Release Inventory System

Source: EPA
Telephone: 202-566-0250

Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/02
Database Release Frequency: Annually

Date of Last EDR Contact: 09/20/04
Date of Next Scheduled EDR Contact: 12/20/04

TSCA: Toxic Substances Control Act

Source: EPA
Telephone: 202-260-5521

Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 04/13/04
Database Release Frequency: Quarterly

Date of Last EDR Contact: 09/07/04
Date of Next Scheduled EDR Contact: 12/20/04

SSTS: Section 7 Tracking Systems

Source: EPA
Telephone: 202-564-5008

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Date of Government Version: 12/31/01
Database Release Frequency: Annually

Date of Last EDR Contact: 10/18/04
Date of Next Scheduled EDR Contact: 01/17/05

FTTS: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)

Source: EPA/Office of Prevention, Pesticides and Toxic Substances
Telephone: 202-564-2501

FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act). To maintain currency, EDR contacts the Agency on a quarterly basis.

Hazardous Materials Management Division Database

Source: Hazardous Materials Management Division
Telephone: 619-338-2268

The database includes: HE58 - This report contains the business name, site address, business phone number, establishment 'H' permit number, type of permit, and the business status. HE17 - In addition to providing the same information provided in the HE58 listing, HE17 provides inspection dates, violations received by the establishment, hazardous waste generated, the quantity, method of storage, treatment/disposal of waste and the hauler, and information on underground storage tanks. Unauthorized Release List - Includes a summary of environmental contamination cases in San Diego County (underground tank cases, non-tank cases, groundwater contamination, and soil contamination are included.)

Date of Government Version: 06/29/04
Database Release Frequency: Quarterly

US BROWNFIELDS: A Listing of Brownfields Sites

Source: Environmental Protection Agency

Telephone: 202-566-2777

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: N/A

Database Release Frequency: Semi-Annually

Date of Next Scheduled EDR Contact: N/A

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: PennWell Corporation

Telephone: (800) 823-6277

This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

GEOCHECK[®] - PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

6340-6390 CHRISTIE AVE.
6340-6390 CHRISTIE AVE.
EMERYVILLE, CA 94608

TARGET PROPERTY COORDINATES

Latitude (North):	37.843498 - 37° 50' 36.6"
Longitude (West):	122.295502 - 122° 17' 43.8"
Universal Transverse Mercator:	Zone 10
UTM X (Meters):	561986.4
UTM Y (Meters):	4188479.8
Elevation:	11 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map: 37122-G3 OAKLAND WEST, CA
General Topographic Gradient: General WSW
Source: USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> ALAMEDA, CA	FEMA Flood <u>Electronic Data</u> YES - refer to the Overview Map and Detail Map
--	--

Flood Plain Panel at Target Property: 0600050000A

<u>NWI Quad at Target Property</u> OAKLAND WEST	NWI Electronic <u>Data Coverage</u> YES - refer to the Overview Map and Detail Map
--	--

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data:*

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Cenozoic
 System: Quaternary
 Series: Quaternary
 Code: Q (decoded above as Era, System & Series)

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: sand
loamy sand
silty clay loam

Surficial Soil Types: sand
loamy sand
silty clay loam

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: sand
fine sand
stratified

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

1.0 INTRODUCTION

This report presents the methods and findings of Aqua Science Engineers, Inc. (ASE)'s soil and groundwater assessment at the Lerer Brothers Transmission Service property located at 6340 Christie Avenue in Emeryville, California (Figure 1). The site assessment activities were initiated by Mr. Rick Gold of Lerer Brothers Transmission Service to delineate the area of petroleum hydrocarbon contamination in soil and groundwater in the vicinity of the former underground storage tank (UST) in order to achieve case closure.

2.0 SITE HISTORY

One 2,000 gallon steel UST used to store unleaded gasoline was removed from the site in 1988. No verifiable records have been located regarding the UST removal.

3.0 SCOPE OF WORK (SOW)

Based on the site history and requirements of the Alameda County Health Care Services Agency (ACHCSA), ASE's scope of work was to:

- 1) Prepare a workplan for approval by the ACHCSA.
- 2) Obtain a drilling permit from the Alameda County Public Works Agency (ACPWA).
- 3) Drill five (5) soil borings at the site with a Geoprobe drill rig. Collect soil and groundwater samples from each boring.
- 4) Analyze one soil and one groundwater sample from each boring at a CAL-EPA certified analytical laboratory for TPH-G by modified EPA Method 5030/8015 and benzene, toluene, ethylbenzene and total xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by EPA Method 8020.
- 5) Backfill the borings with neat cement.
- 6) Prepare a report outlining the methods and findings of this assessment.

4.0 DRILL SOIL BORINGS AND COLLECT SAMPLES

Prior to drilling, ASE obtained a drilling permit from ACPWA. A copy of this permit is presented in Appendix A.

On October 9, 1998, Gregg Drilling of Martinez, California drilled soil borings BH-A through BH-E at the site using a Geoprobe hydraulic sampling rig (Figure 2). The drilling was directed by ASE staff geologist Greg Schramm and senior project manager David Allen.

Undisturbed soil samples were collected continuously as drilling progressed for lithologic and hydrogeologic description and for possible chemical analysis. The samples were collected by driving a sampler lined with acetate tubes using hydraulic direct push methods. Selective soil samples were immediately cut at the appropriate sampling interval, trimmed, sealed with Teflon tape, plastic end caps and duct tape, labeled, sealed in plastic bags and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP #1094) under chain of custody. Soil from the remaining tubes were described by the site geologist and was periodically screened for volatile compounds using an Organic Vapor Meter (OVM). The soil was screened by emptying soil from one of the sample tubes into a plastic bag. The bag was then sealed and placed in the sun for approximately 10 minutes. After the volatile compounds were allowed to volatilize, the OVM measured the vapor in the bag through a small hole punched in the bag. OVM readings are used as a screening tool only, since the procedures are not as rigorous as those used in the laboratory.

A temporary PVC well casing was driven into place in each boring for the collection of groundwater samples. Groundwater samples were removed from the borings with disposable polyethylene bailers. The groundwater samples were contained in 40-ml volatile organic analysis (VOA) vials (pre-preserved with hydrochloric acid) and capped without headspace. The samples were then labeled, placed in protective foam sleeves, and stored on ice for transport to Chromalab under chain of custody. Upon completion of the soil and groundwater sampling, the borings were backfilled with neat cement to the ground surface.

Drilling equipment was cleaned with a TSP solution between sampling intervals and between borings to prevent potential cross-contamination.

Sediments encountered during drilling generally consisted of up to three feet of a debris-free silty clay fill overlying a sandy fill material containing wood and asphalt shingle roofing material, brick and rubber to the total

depth explored of 8-feet below ground surface (bgs). No native soil was encountered. Groundwater was encountered at between 4 and 6 feet bgs and rose to approximately 4-feet bgs in each boring where it stabilized. Petroleum hydrocarbon odors and/or olive hydrocarbon staining were present in soil samples from borings BH-A, BH-B and BH-C. A hydrocarbon sheen was present on groundwater from boring BH-A. There were no obvious indications of hydrocarbons in borings BH-D and BH-E.

5.0 ANALYTICAL RESULTS FOR SOIL

One soil sample was collected from each boring for analysis. The soil sample chosen for analysis was collected from what appeared to be the capillary zone in each boring, just above completely saturated sediments. The samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015 and BTEX and MTBE by EPA Method 8020. The analytical results are tabulated in Table One, and the certified analytical report and chain of custody form are included in Appendix B.

TABLE ONE
Summary of Chemical Analysis of **SOIL** Samples
All results are in **parts per million**

Boring	Depth Sampled	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE
BH-A	6.0'	1,400	<6.2	25	7.1	15	<6.2
BH-B	3.5'	<1.0	0.0090	0.0083	0.012	0.039	<0.0050
BH-C	4.0'	<1.0	0.011	<0.0050	0.080	0.16	<0.0050
BH-D	4.0'	<1.0	<0.0050	<0.0050	<0.0050	0.0087	<0.0050
BH-E	5.5'	<1.0	<0.0050	<0.0050	<0.0050	<0.0050	<0.0050
PRG		NE	1.4	880	230	320	NE

Notes:

Detectable concentrations are in **bold**.

Non-detectable concentrations are noted by the less than sign (<) followed by the detection limit.

PRG is the United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goal (PRG) for industrial soil.

NE = US EPA PRG is not established.

The soil sample collected from 6.0-foot bgs in boring BH-A contained 1,400 parts per million (ppm) TPH-G, 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX compound at concentrations below 1 ppm. None of the BTEX concentrations detected at the site exceeded United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goals (PRGs) for industrial soil.

6.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015 and BTEX and MTBE by EPA Method 8020. The analytical results are tabulated in Table Two, and the certified analytical report and chain of custody forms are included in Appendix B.

TABLE TWO
Summary of Chemical Analysis of **GROUNDWATER** Samples
All results are in **parts per billion**

Boring	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE
BH-A	620,000	1,200	4,900	16,000	64,000	< 1,000
BH-B	40,000	280	110	3,200	6,400	< 250
BH-C	18,000	56	280	150	120	< 50
BH-D	< 50	< 0.5	< 0.5	< 0.5	< 0.5	< 5.0
BH-E	< 50*	< 0.5	< 0.5	< 0.5	1.2	< 5.0
DTSC MCL	NE	1.0	150	700	1,750	35**

Notes:

DTSC MCL is the California Department of Toxic Substances Control maximum contaminant level for drinking water.

NE = DTSC MCLs is not established.

* = Hydrocarbons uncharacteristic of gasoline detected in gasoline range at 98 parts per billion.

** = DTSC interim action level for drinking water. MCL not established.

Detectable concentrations are in **bold**.

Elevated hydrocarbon concentrations, including benzene, toluene, ethylbenzene and/or total xylene concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water, were detected in groundwater samples collected from the borings BH-A, BH-B and BH-C in the vicinity of the former UST at the site. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Up to 1,400 ppm TPH-G, 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX compounds at concentrations below 1 ppm. None of the BTEX concentrations exceeded US EPA PRGs for industrial soil. No MTBE was detected in any of the soil samples analyzed.

Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding DTSC MCLs for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

Based on these results, ASE anticipates that the ACHCSA will require further assessment activities, including the installation of three groundwater monitoring wells and at least one year of groundwater monitoring, prior to considering case closure at this site.

8.0 REPORT LIMITATIONS

The results of this assessment represent conditions at the time of the soil and groundwater sampling, at the specific locations where the samples were collected, and for the specific parameters analyzed by the laboratory.

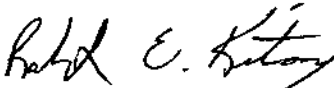

This report does not fully characterize the site for contamination resulting from unknown sources or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of an independent CAL-EPA certified laboratory. The

independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

Aqua Science Engineers appreciates the opportunity provide environmental consulting services for this project. Should you have any questions or comments, please feel free to call us at (925) 820-9391.

1.0 INTRODUCTION

This report presents the methods and findings of Aqua Science Engineers, Inc. (ASE)'s soil and groundwater assessment at the Lerer Brothers Transmission Service property located at 6340 Christie Avenue in Emeryville, California (Figure 1). The site assessment activities were initiated by Mr. Rick Gold of Lerer Brothers Transmission Service as required in a letter from the Alameda County Health Care Services Agency (ACHCSA) dated December 7, 1998 (Appendix A).

2.0 SITE HISTORY

One 2,000 gallon steel underground storage tank (UST) used to store unleaded gasoline was removed from the site in 1988. No verifiable records have been located regarding the UST removal.

On October 9, 1998, ASE drilled five soil borings at the site (Figure 2). Up to 1,400 parts per million (ppm) total petroleum hydrocarbons as gasoline (TPH-G), 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX (benzene, toluene, ethylbenzene and total xylenes) compound at concentrations below 1 ppm. None of the BTEX concentrations exceeded United States Environmental Protection Agency (US EPA) Region IX preliminary remediation goals (PRGs) for industrial soil. No methyl tertiary butyl ether (MTBE) was detected in any of the soil samples analyzed.

Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

3.0 SCOPE OF WORK (SOW)

Based on the site history and requirements of the ACHCSA, ASE's SOW was as follows:

- 1) Prepare a workplan and a health and safety plan for approval by the ACHCSA.
- 2) Obtain a drilling permit from the Alameda County Public Works Agency (ACPWA).
- 3) Drill three (3) soil borings to approximately 19-feet below ground surface (bgs) at the site.
- 4) Analyze at least one soil sample from each boring at a CAL-EPA certified analytical laboratory for TPH-G by modified EPA Method 5030/8015, BTEX and MTBE by EPA Method 8020 and lead by EPA Method 6010.
- 5) Install 2-inch diameter groundwater monitoring wells in each boring described in task 3.
- 6) Develop the monitoring wells.
- 7) Collect groundwater samples from each monitoring well for analyses.
- 8) Analyze the groundwater samples at a CAL-EPA certified analytical laboratory for TPH-G, BTEX, MTBE and dissolved lead.
- 9) Survey the top of casing elevation of each well, and determine the groundwater flow direction and gradient beneath the site.
- 10) Prepare a report detailing the methods and findings of this assessment.

Details of this assessment follow.

4.0 DRILLING SOIL BORINGS AND COLLECTING SAMPLES

Prior to drilling, ASE obtained an Alameda County Public Works Agency drilling permit (Appendix B). ASE also notified Underground Service Alert (USA) to have underground public utilities in the vicinity of the site marked prior to drilling.

On January 21, 1999, Kvilhaug Well Drilling of Concord, California drilled soil borings MW-1, MW-2 and MW-3 at the site using a Mobile B-61 drill rig equipped with 8-inch diameter hollow-stem augers (Figure 3). Groundwater monitoring wells MW-1, MW-2 and MW-3 were subsequently

constructed in these borings. These locations were chosen to monitor groundwater adjacent to and downgradient of the former UST. The groundwater flow direction was assumed to be to the west based on ASE's knowledge of regional groundwater flow as well as conversations with Ms. Susan Hugo of the ACHCSA, the case worker for several sites in the site vicinity. The drilling was directed by ASE staff geologist Greg Schramm and ASE senior geologist Robert E. Kitay, R.G.

Undisturbed soil samples were collected at 5-foot intervals as drilling progressed for lithologic and hydrogeologic description and for possible chemical analyses. The samples were collected by driving a split-barrel drive sampler lined with 2-inch diameter brass tubes ahead of the auger tip with successive blows from a 140-lb. hammer dropped 30-inches. One tube from each sampling interval was immediately trimmed, sealed with Teflon tape, plastic end caps and duct tape, labeled, sealed in a plastic bag and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP #1094) under chain of custody. Soil from the remaining tubes was described by the site geologist using the Unified Soil Classification System.

Drilling equipment was steam-cleaned prior to use, and sampling equipment was washed with a TSP solution between sampling intervals to prevent cross-contamination. Rinsate was contained on-site in sealed and labeled 55-gallon steel drums.

Sediments encountered during drilling generally consisted of silty or gravelly sand with abundant debris such as tar, tar paper, roofing shingle material, railroad ties and railroad spikes. Hydrocarbon odors were present in all three borings, including strong odors at times. Groundwater was encountered between 3.7 and 6.5-feet bgs. The boring logs and well construction details are included as Appendix C. Based on conversations with Ms. Hugo of the ACHCSA, this type of fill material is very common in the site vicinity. She also stated that there may have been a tar or asphalt plant in the immediate site vicinity.

Drill cuttings were contained in sealed and labeled 55-gallon steel drums and stored on-site for temporary storage until off-site storage can be arranged.

5.0 ANALYTICAL RESULTS FOR SOIL

The soil sample collected from 4.5-foot bgs in each boring was analyzed by Chromalab, Inc. for TPH-G by modified EPA Method 5030/8015, BTEX

and MTBE by EPA Method 8020 and total lead by EPA Method 7420. The analytical results are tabulated in Table One, and a copy of the certified analytical report and chain of custody form are included in Appendix D.

TABLE ONE
Summary of Chemical Analysis of SOIL Samples
All results are in parts per million

Boring	Depth Sampled	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE	Total Lead
MW-1	4.5'	< 100*	< 6.2	< 6.2	13	27	< 6.2	130
MW-2	4.5'	< 1.0	< 0.0050	< 0.0050	< 0.0050	< 0.0050	< 0.0050	49
MW-3	4.5'	< 1.2	< 0.005	< 0.005	0.0073	0.027	< 0.005	72
PRG		NE	0.62	520	230	210	NE	130

Notes:

Non-detectable concentrations are noted by the less than symbol (<) followed by the detection limit.

Detectable concentrations are in **bold**.

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 1,500 parts per million.

PRG is the United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goal (PRG) for residential soil.

None of the hydrocarbon or lead concentrations detected during this assessment exceeded US EPA PRGs for residential soil.

6.0 MONITORING WELL INSTALLATION, DEVELOPMENT AND SAMPLING

Groundwater monitoring wells MW-1, MW-2 and MW-3 were installed in borings MW-1, MW-2 and MW-3, respectively. The wells were constructed with 2-inch diameter, 0.020-inch slotted, flush-threaded, Schedule 40 PVC well screen and blank casing. Each well is screened between 3-feet bgs and the total depth of the well, between 15 and 19-feet bgs, to monitor the first water bearing zone encountered. Lonestar #3 Monterey sand occupies the annular space between the borehole and the casing from the bottom of the boring to approximately 1-foot above the well screen. A 0.5-foot thick hydrated bentonite layer separates the sand from the overlying cement surface seal. The wellheads are secured with locking wellplugs beneath at-grade traffic-rated vaults.

On January 24, 1999, ASE staff geologist Greg Schramm developed each monitoring well using at least two episodes of surge-block agitation and bailer evacuation. Over ten well casing volumes of water were removed from each well during development, and evacuation continued until the water was relatively clear.

On January 28, 1999, ASE staff geologist Greg Schramm collected groundwater samples from each monitoring well for analysis. A sheen was present on the surface of groundwater in all three monitoring wells. Prior to sampling, the wells were purged of four well casing volumes of groundwater. The pH, temperature and conductivity of the purge water were monitored during evacuation, and samples were not collected until these parameters stabilized. Samples were collected from the wells using pre-cleaned polyethylene bailers. The groundwater samples were decanted from the bailers into 40-ml volatile organic analysis (VOA) vials, preserved with hydrochloric acid and sealed without headspace. The samples for lead analysis were contained in 500-ml polyethylene bottles. All of the samples were labeled and stored on ice for transport to Chromalab, Inc. of Pleasanton, California under chain of custody. The laboratory was instructed to filter and preserve the samples for lead analysis immediately upon receipt. Well development and sampling purge water were contained in 55-gallon steel drums and stored on-site for temporary storage. See Appendix E for a copy of the Field Logs.

7.0 GROUNDWATER ELEVATIONS

ASE surveyed the top of casing elevation of each well relative to a site datum on January 28, 1999. An assumed site datum elevation of 10.00-feet above mean sea level (msl) was interpolated from the USGS Oakland West, California 7.5 Minute Quadrangle (1980). The top of casing elevation of monitoring well MW-1 was set at 10.00-feet and the top of casing elevations of monitoring wells MW-2 and MW-3 were surveyed relative to monitoring well MW-1. Depths to groundwater were measured in each well prior to sampling on January 28, 1999 with an electric water level sounder. Depth to groundwater measurements are presented in Table Two, and groundwater elevation (potentiometric surface) contours are plotted on Figure 4. On January 28, 1999, groundwater appeared to flow to the south beneath the site at a gradient of 0.0138-feet/foot.

TABLE TWO
Summary of Groundwater Well Survey Data

Well I.D.	Date of Measurement	Top of Casing Elevation (relative to project datum)	Depth to Water (feet)	Groundwater Elevation (project data)
MW-1	1-28-99	10.00	4.85	5.15
MW-2	1-28-99	9.96	4.17	5.79
MW-3	1-28-99	9.25	4.23	5.02

8.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015, BTEX and MTBE by EPA Method 8020 and dissolved lead by EPA Method 6010. The analytical results are tabulated in Table Three, and copies of the certified analytical report and chain of custody form are included in Appendix F.

TABLE THREE
Summary of Chemical Analysis of **GROUNDWATER** Samples
All results are in **parts per billion**

Well	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE	Dissolved Lead
MW-1	730	22	3.3	24	61	<5.0	<5.0
MW-2	710	20	180	14	67	<5.0	<5.0
MW-3	<50*	<0.5	<0.5	<0.5	0.69	<5.0	<5.0
DTSC MCL	NE	1.0	150	700	1,750	35**	15

Notes:

DTSC MCL is the California Department of Toxic Substances Control maximum contaminant level for drinking water.

NE = DTSC MCLs are not established.

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 68 parts per billion.
** = DTSC interim action level for drinking water; MCL not established.

Detectable concentrations are in **bold**.

Non-detectable concentrations noted by the less than sign (<) followed by the detection limit.

Benzene concentrations detected in groundwater samples collected from monitoring wells MW-1 and MW-2 exceeded the DTSC MCL for drinking water. The toluene concentration detected in groundwater samples collected from monitoring well MW-2 also exceeded the DTSC MCL for drinking water. Only very low concentrations of hydrocarbons, below DTSC MCLs for drinking water, were detected in groundwater samples collected from monitoring well MW-3. No lead was detected in groundwater samples collected from any of the monitoring wells.

9.0 CONCLUSIONS AND RECOMMENDATIONS

None of the hydrocarbon or lead concentrations detected in soil samples collected during this assessment exceeded US EPA PRGs for residential soil.

Benzene concentrations detected in groundwater samples collected from monitoring wells MW-1 and MW-2 exceeded DTSC MCLs for drinking water. The toluene concentration detected in groundwater samples collected from monitoring well MW-2 also exceeded the DTSC MCL for drinking water. No lead was detected in groundwater samples collected from any of the monitoring wells.

Based on the potentiometric surface contours, groundwater appears to flow to the south beneath the site at a gradient of 0.0138-feet/foot. This groundwater flow direction is not consistent with the expected groundwater flow direction to the west which was based on information provided by the ACHCSA and ASE's knowledge of regional groundwater in the Emeryville area.

Strong odors were present in soil encountered beneath the site, and a sheen was detected on the groundwater surface in the site monitoring wells. The analytical results do not indicate as significant contamination as field conditions would indicate. Based on this information, it appears that there is contamination beneath the site that is possibly related to the fill material beneath the site and not the former gasoline UST.

ASE recommends that groundwater samples be collected from the site wells on a quarterly basis. In addition, ASE recommends that water level measurements be collected from the site on a monthly basis for the next quarter to confirm the groundwater flow direction beneath the site. If the groundwater flow direction remains to the south, an additional groundwater monitoring well may be necessary downgradient of the former UST. The next groundwater sampling at the site is scheduled for April 1999. Lead analyses will be discontinued in future sampling periods.

10.0 REPORT LIMITATIONS

The results of this assessment represent conditions at the time of the soil and groundwater sampling, at the specific locations where the samples were collected, and for the specific parameters analyzed by the laboratory.

It does not fully characterize the site for contamination resulting from unknown sources, or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of an independent CAL-EPA certified laboratory. The independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

Aqua Science Engineers appreciates the opportunity to assist Lerer Brothers Transmission Service with their environmental needs. Should you have any questions or comments, please feel free to call us at (925) 820-9391.

This report presents the results of the October 22, 1999 quarterly groundwater sampling and additional boring groundwater sampling for the above-referenced site. This sampling was conducted as required by the ACHCSA. ASE has prepared this report on behalf of Mr. Richard Gold, owner of the property.

2.0 DRILL TWO ADDITIONAL SOIL BORINGS AND COLLECT GROUNDWATER SAMPLES

Two soil borings were drilled on the neighboring property to the south to determine the extent of groundwater contamination downgradient of the site. Prior to drilling, ASE obtained an access agreement from the neighboring property owner, The Martin Group, to allow this drilling on their property. ASE also obtained a drilling permit from the Alameda County Public Works Agency (ACPWA). A copy of this permit is presented in Appendix A.

On October 22, 1999, Gregg Drilling of Martinez, California drilled soil borings BH-F and BH-G on The Martin Group property south of the site using a Geoprobe hydraulic sampling rig (Figure 2). These borings were drilled south of the former Underground Storage Tank (UST) to determine the extent of groundwater contamination downgradient of the UST. The drilling was directed by ASE associate geologist Ian Reed and senior geologist Robert E. Kitay, R.G.

Undisturbed soil samples were collected continuously as drilling progressed for lithologic and hydrogeologic description. No soil samples were retained for analysis. The samples were collected by driving a sampler lined with acetate tubes using hydraulic direct push methods. Soil was described by the site geologist using the Unified Soil Classification System. Boring logs are presented in Appendix B.

Groundwater samples were removed from the borings with a bailer. The groundwater samples were contained in 40-ml volatile organic analysis (VOA) vials, preserved with hydrochloric acid, and sealed without headspace. The samples were then labeled and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP 1094) under chain of custody. Upon completion of the groundwater sampling, the borings were backfilled with neat cement to the ground surface.

Drilling equipment was cleaned with a TSP solution between sampling intervals and between borings to prevent potential cross-contamination.

3.0 GROUNDWATER FLOW DIRECTION AND GRADIENT

On October 22, 1999, ASE environmental scientist Ian Reed measured the depth to water in each site groundwater monitoring well using an electric water level sounder. The surface of the groundwater was also checked for the presence of free-floating hydrocarbons or sheen. There was no free-

floating product or sheen present in any well. Current and historical groundwater elevation data is presented as Table One.

TABLE ONE
Groundwater Elevation Data

Well I.D.	Date of Measurement	Top of Casing Elevation (relative to project datum)	Depth to Water (feet)	Groundwater Elevation (project data)
MW-1	1-28-99	10.00	4.85	5.15
	3-29-99		4.85	5.15
	7-20-99		5.08	4.92
	10-22-99		5.08	4.92
MW-2	1-28-99	9.96	4.17	5.79
	3-29-99		3.89	6.07
	7-20-99		4.30	5.66
	10-22-99		4.36	5.60
MW-3	1-28-99	9.25	4.23	5.02
	3-29-99		4.41	4.84
	7-20-99		3.86	5.39
	10-22-99		3.94	5.31

A groundwater potentiometric surface map is presented as Figure 2. The groundwater flow direction is to the southeast with a gradient of approximately 0.014-feet/foot. This groundwater flow direction and gradient are consistent with historical groundwater flow direction and gradient data which consistently shows the groundwater flow beneath the site to the south or southeast.

4.0 GROUNDWATER SAMPLE COLLECTION AND ANALYSIS

Prior to sampling, each monitoring well was purged of four well casing volumes of groundwater using a dedicated bailer. Slight petroleum hydrocarbon odors were present during the purging and sampling of the groundwater monitoring wells. The parameters pH, temperature and conductivity were monitored during the well purging. Samples were not collected until these parameters stabilized. Groundwater samples were collected from each well using dedicated polyethylene bailers. The samples were decanted from the bailers into 40-ml VOA vials, preserved with hydrochloric acid, sealed without headspace, labeled and placed in coolers with wet ice for transport to Chromalab under appropriate chain-

of-custody documentation. Well sampling field logs are presented in Appendix C.

5.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples collected from all three groundwater monitoring wells, as well as from borings BH-F and BH-G, were analyzed for total petroleum hydrocarbons as gasoline (TPH-G) by EPA Method 5030/8015M, benzene, toluene, ethylbenzene and total xylenes (collectively known as BTEX) by EPA Method 8020 and methyl tertiary butyl ether (MTBE) by EPA Method 8020. The analytical results are presented in Table Two. The certified analytical report and chain-of-custody documentation are included as Appendix D.

Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and boring BH-F all exceeded the California Department of Health Services (DHS) maximum contaminant level (MCL) for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. Although the benzene concentrations exceeded the DHS MCL for drinking water, these concentrations are relatively low and would not be considered a threat to human health in non-drinking water scenarios. The hydrocarbon trends are relatively stable although there does appear to be a slight increasing trend in hydrocarbon concentrations in groundwater samples collected from monitoring well MW-1.

TABLE TWO
Certified Analytical Results of GROUNDWATER Samples
All results are in parts per billion

Well ID & Dates Sampled	TPH-G	Benzene	Toluene	Ethyl- benzene	Total Xylenes	MTBE	Lead
<u>MW-1</u>							
1-28-99	730	22	3.3	24	61	< 5.0	< 5.0
3-29-99	950	37	5.7	27	60	< 5.0	--
7-20-99	970	40	5.4	67	120	< 5.0	--

10-22-99	280	13	10	6.2	36	< 5.0	--
<u>MW-3</u>							
1-28-99	< 50*	< 0.5	< 0.5	< 0.5	0.69	< 5.0	< 5.0
3-29-99	130	1.9	8.2	1.4	7.1	< 5.0	--
7-20-99	170	< 0.5	1.9	< 0.5	0.89	< 5.0	--
10-22-99	70**	< 0.5	< 0.5	< 0.5	< 0.5	< 5.0	--
BH-F	65	1.2	< 0.5	1.4	2.4	< 5.0	--
BH-G	180**	< 1.0	< 1.0	1.5	9.1	< 10	--
DHS MCL	NE	1	150	700	1,750	13	15
EPA METHOD	5030/ 8015M	8020	8020	8020	8020	8020	6010

Notes:

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 68 ppb.

** = Hydrocarbons detected do not match a gasoline standard.

-- = Not analyzed

NE = DHS MCL not established

DHS MCL = Department of Health Services maximum contaminant level for drinking water.

Non-detectable concentrations noted by the less than sign (<) followed by the laboratory detection limit.

4.0 CONCLUSIONS

The groundwater flow direction beneath this site is to the southeast at a gradient of 0.014 feet/foot, which is consistent with the historical groundwater flow direction and gradient beneath the site.

Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and boring BH-F all exceeded the DHS MCL for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. Although the benzene concentrations exceeded the DHS MCL for drinking water, groundwater in the site vicinity is not used for drinking water. In non-drinking water scenarios, these concentrations would be considered relatively low and not a threat to human health or the environment. The hydrocarbon trends are relatively stable although there does appear to be a slight increasing trend in hydrocarbon concentrations in groundwater samples collected from monitoring well MW-1.

5.0 RECOMMENDATIONS

Based on the relatively low hydrocarbon concentrations detected in groundwater samples collected during the one year of quarterly groundwater monitoring, the limited horizontal extent of hydrocarbons in groundwater, and the current commercial/industrial usage of the site, ASE recommends that the ACHCSA and RWQCB review this case for closure.

6.0 REPORT LIMITATIONS

The results presented in this report represent the conditions at the time of the groundwater sampling, at the specific locations where the groundwater samples were collected, and for the specific parameters analyzed by the laboratory. It does not fully characterize the site for contamination resulting from sources other than the former underground storage tanks and associated plumbing at the site, or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of independent CAL-EPA certified laboratory. The independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

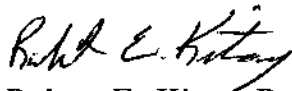

Aqua Science Engineers appreciates the opportunity to provide environmental consulting services to Lerer Brother Transmission Service, and trust that this report meets your needs. Please feel free to call us at (925) 820-9391 if you have any questions or comments.

Gentlemen:

Re: Claim # 013874

Susan Hugo, Alameda County Health Dept., gave me permission to have all three wells removed from 6340 Christie Ave., Emeryville. Last Friday, April 28, 2000, Aqua Science Engineers supervised the removal of the wells.

I am awaiting the necessary paperwork for "closure." When everything is completed I will forward it to you.

Sincerely,

A handwritten signature in cursive script that reads "Richard Gold".

Re: Claim #013874,
6340 Christie, Emeryville, CA

Gentlemen:

As per my phone conversation yesterday morning with Dolores Ortiz, I am requesting a 30-day extension on the above-listed claim. As I stated in my letter dated May 3, 2000 all the wells have been removed after receiving permission from Susan Hugo of the Alameda Health Dept. This letter will explain the delay in receiving closure and applying for reimbursement from The Fund.

Evidently, the site contains just enough contamination to prevent it from being used for residential purposes, or a school, hospital. However, the site is satisfactory for a commercial, business, or industrial use. I have presently leased it to an electrical supply and parts company.

Susan Hugo advises me that in order to receive closure, a "deed restriction" must be recorded by Alameda County. This is what is causing the delay. The County is in the process of preparing a standard form to be used. Last weeks Susan Hugo told me that it might take another month to complete the form (?). She suggests that I wait until it is completed rather than use an old format that she sent me.

I explained to Mrs. Hugo that my Letter of Commitment might be withdrawn. I will ask her again around the end of July, and if the form is still not ready I will use the old format and do the best I can.

Sincerely,

A handwritten signature in cursive script that reads "Richard Gold".

Richard Gold

Ms. Donna Drogos
Alameda County Health Care Services Agency
1131 Harbor Bay Parkway, Suite 250
Alameda, CA 94502-6577

SUBJECT: CASE CLOSURE REQUEST
Lerer Brothers Transmission Service
6340 Christie Avenue
Emeryville, California

Dear Ms. Drogos:

In May 2000, the Alameda County Health Care Services Agency (ACHCSA) agreed to close the above-referenced case once a deed restriction was put into place. The deed restriction was to exclude the site from use as residential, school, day care facilities and hospitals. The case worker at the time for the ACHCSA was Susan Hugo. My client, Mr. Richard Gold, the property owner, at the time decided to not sell the property and did not complete the deed restriction. Mr. Gold recently contacted ASE as he would like to pursue obtaining case closure for the site once again. His hope is to complete the case closure without a deed restriction if possible. The short term planned use of the property is a winery. The following is a brief history of the case:

SITE HISTORY

One 2,000 gallon steel underground storage tank (UST) used to store unleaded gasoline was removed from the site in 1988.

In October 1998, five soil borings were drilled at the site and soil and groundwater samples were collected. Up to 1,400 parts per million (ppm) total petroleum hydrocarbons as gasoline (TPH-G), 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX (benzene, toluene, ethylbenzene and total xylenes) compounds

at concentrations below 1 ppm. None of the BTEX concentrations exceeded United States Environmental Protection Agency (US EPA) Region IX preliminary remediation goals (PRGs) for industrial soil. No methyl tertiary butyl ether (MTBE) was detected in any of the soil samples analyzed. Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

In January 1999, monitoring wells MW-1, MW-2 and MW-3 were installed at the site. Sediments encountered during drilling generally consisted of silty or gravelly sand with abundant debris such as tar, tar paper, roofing shingle material, railroad ties and railroad spikes. Hydrocarbon odors were present in all three borings, including strong odors at times. Groundwater was encountered between 3.7 and 6.5-feet below ground surface (bgs). Soil samples collected during the monitoring well installation contained up to 13 ppm ethylbenzene, 27 ppm total xylenes and 130 ppm total lead. None of the hydrocarbon or lead concentrations detected exceeded US EPA PRGs for residential soil. Groundwater samples collected from the monitoring wells contained up to 730 parts per billion (ppb) TPH-G, 22 ppb benzene, 180 ppb toluene, 24 ppb ethylbenzene, and 67 ppb total xylenes. No dissolved lead or MTBE were detected in any of the groundwater samples collected. Groundwater appeared to flow to the south beneath the site at a gradient of 0.0138-feet/foot.

Groundwater samples were collected from the three site monitoring wells on a quarterly basis. The hydrocarbon concentrations were generally consistent over this period. Benzene concentrations in groundwater samples collected from monitoring well MW-1, the well with the highest hydrocarbon concentrations, ranged from 22 ppb to 71 ppb. Over this period, the groundwater flow direction was generally to the south or southeast.

In October 1999, ASE drilled soil borings BH-F and BH-G on The Martin Group property south and southeast of the site using a Geoprobe hydraulic sampling rig. These borings were drilled south of the former UST to determine the extent of groundwater contamination downgradient of the UST. Groundwater samples were also collected from the three site monitoring wells at this time. Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and

boring BH-F all exceeded the DHS MCL for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. The benzene concentration in the groundwater sample collected from boring BH-F was 1.2 ppb, which is just over the DHS MCL for drinking water and essentially defines the downgradient extent of contamination. Although the benzene concentrations exceeded the DHS MCL for drinking water, groundwater in the site vicinity is not used for drinking water. In non-drinking water scenarios, these concentrations would be considered relatively low and not a threat to human health or the environment.

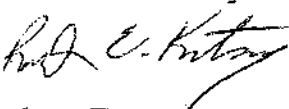

Following completion of the soil and groundwater assessment activities described above, the site groundwater monitoring wells were properly destroyed in May 2000 as approved by the ACHCSA in anticipation of case closure.

REQUEST FOR CASE CLOSURE

On behalf of Mr. Richard Gold, ASE requests that the ACHCSA review the file for the case to determine whether the case may be closed with the available information. If you have any questions, you can reach Robert Kitay of ASE at (925) 820-9391. Richard Gold can be reached at (650) 579-1919.

**QUARTERLY GROUNDWATER MONITORING REPORT
OCTOBER 1996 SAMPLING EVENT
EMERY BAY MARKETPLACE
EMERYVILLE, CALIFORNIA**

Dear Ms. Tolin:

This letter report presents data collected by PES Environmental, Inc. (PES) during the October 1996 quarterly groundwater monitoring conducted at the Emery Bay Marketplace site, located in Emeryville, California (Plate 1). PES has been retained by Christie Avenue Partners - J.S. to conduct quarterly groundwater at the subject site. The current groundwater monitoring program consists of measuring product thickness, if any, and depth to groundwater in 13 onsite and off-site monitoring wells on a quarterly basis, and purging and sampling six of the monitoring wells (Wells W-7, W-13, W-14, W-19, W-20 and W-24). Plate 2 shows the location of monitoring wells at the site.

The purpose of the groundwater monitoring program at this site is to: (1) evaluate the presence of hydrocarbons in groundwater; (2) monitor potential migration of dissolved-phase hydrocarbons; and (3) monitor seasonal water level variations at the subject property. The monitoring is performed in accordance with Alameda County Department of Environmental Health (ACDEH) requirements and the approved work plan for this site entitled *Work Plan for Groundwater Monitoring and Free Product Removal at the Emery Bay Marketplace, Emeryville, California*, prepared by McLaren Hart and dated July 6, 1990.

In addition to the standard scope of work performed during the quarterly groundwater monitoring and at the request of ACDEH, additional groundwater samples were collected during the October 1996 sampling event and analyzed for polynuclear aromatic hydrocarbons (PNAs). The purpose of the analyses was to support an evaluation of the decision for site closure.

Ms. Lynn Tolin
November 27, 1996
Page 2

BACKGROUND

Beginning in the early 1980's, environmental activities at this site consisted of removal of underground fuel storage tanks (USTs) and hydrocarbon contaminated soils, performing soil borings, and installing groundwater monitoring wells. As a result of these activities, fuel oil found in onsite soils and groundwater was attributed to leaking USTs and/or piping associated with an asphalt refinery formerly located at the site. Additionally, free floating product was observed in onsite groundwater monitoring wells.

Twenty-four monitoring wells have been installed at this site during the course of prior environmental investigations. McLaren Hart began quarterly groundwater monitoring activities at the subject site in July 1990. During that time, seven of these wells were abandoned. Due to the construction of the new roadway along the eastern portion of the property, four additional monitoring wells (W-5, W-8, W-15, and W-17) were abandoned on October 8, 1996. As a result, 13 onsite and off-site wells remain at the site. The present sampling is the fourteenth since PES began performing quarterly groundwater monitoring in July 1993.

GROUNDWATER ELEVATIONS

Water-level Measurement Procedures

Prior to sampling, groundwater levels in the monitoring wells were measured by Blaine Tech Services (Blaine Tech) to a precision of 0.01 foot using an electronic water-level indicator/interface probe. Prior to each measurement, the portion of the water-level indicator that was submerged in the well was cleaned with a mild detergent solution and rinsed with de-ionized water. The presence of free-phase product was evaluated and, if present, was measured to a precision of 0.01 foot using an interface probe.

Results

Water levels for the monitoring wells were measured on October 24, 1996. Two of the monitoring wells (Wells W-4 and W-16) were inaccessible due to grading related to construction activities along the adjacent railroad property. Two additional wells (Wells W-13 and W-14) could not be access on October 24 because they had been paved over. The wells were subsequently located and uncovered and groundwater levels were collected on October 30, 1996. Groundwater levels were converted to water-level elevations referenced to mean sea level (MSL). A groundwater elevation map constructed from the data is presented on Plate 3. An historical summary of groundwater elevations and product levels for wells at the site is presented in Table 1, and a report summarizing the water level measurement procedures is presented in Appendix A.

Ms. Lynn Tolin
November 27, 1996
Page 3

Water levels in all measured wells have generally varied relative to the July 1996 sampling event. Water levels decreased in six of the onsite monitoring wells and increased in five wells. Based on measured water levels on October 24 and 30, 1996, groundwater at the site flows in a southwesterly direction with an approximate gradient of 0.004 to 0.007. These measurements show no significant changes from historical groundwater flow direction and gradient.

Consistent with historical monitoring results, a free-phase product layer of 0.08 feet thick was found in Well W-19. No free-phase product or sheen were found in the remaining wells. The groundwater elevation of Well W-19 presented in Table 1 and Plate 3 have been corrected for the free-phase product layer observed.

GROUNDWATER SAMPLING AND ANALYTICAL TESTING

Sampling Protocol

Groundwater samples were collected by Blaine Tech from Wells W-7, W-19, W-20, and W-24 on October 24, 1996, and from Wells W-13 and W-14 on October 30, 1996. A minimum of three well volumes were purged prior to sampling using a clean teflon bailer. Purge water was contained and collected in a 55-gallon drum to be stored onsite prior to obtaining analytical results and subsequent disposal. During purging activities, the discharge water was measured for pH, temperature, electrical conductivity and turbidity. Groundwater samples were collected with a clean teflon bailer and decanted into clean 1-liter glass bottles preserved with hydrochloric acid.

Samples were immediately labeled to designate sample number, time and date collected, and analyses requested, and stored in a chilled, thermally insulated cooler for transport to the analytical laboratory for chemical analyses. The information collected during groundwater sampling activities and the chain of custody record is included in a groundwater sampling report prepared by Blaine Tech and presented in Appendix A.

Analytical Program

All groundwater samples collected during this quarterly monitoring event were analyzed by American Environmental Network (AEN), a State-certified laboratory located in Pleasant Hill, California. Samples were analyzed for total petroleum hydrocarbons quantified as diesel (TPH-diesel) and as motor oil (TPH-oil) by EPA Test Method 8015 (modified). PNAs were analyzed using EPA Test Method 8270.

Ms. Lynn Tolin
November 27, 1996
Page 4

Analytical Results

Sample analytical results from the recent groundwater monitoring event indicate that TPH-diesel was detected in five of the six wells sampled, at concentrations ranging from 0.12 milligrams per liter (mg/l) in Well W-24 to 15 mg/l in Well W-19. TPH-oil was detected in three of the six wells sampled, at concentrations ranging from 0.4 mg/l in Well W-20 and 2.3 mg/l in Well W-19. Concentrations of TPH-diesel have decreased in Wells W-7, W-13, W-14, and W-24, and increased in Well W-19 since the last monitoring event. Concentrations of TPH-oil have decreased in Wells W-7 and W-20, and increased in Well W-19. TPH-oil was not detected in Wells W-13, W-14, and W-24. No PNAs were detected in any of the six wells sampled.

Analytical results, including historical monitoring data for the previous sampling events, are presented in Table 2. The laboratory report and chain of custody records are provided in Appendix B. The distribution of hydrocarbons in groundwater at the site on October 24 and October 30, 1996 is presented on Plate 4.

SUMMARY

Groundwater elevations have generally varied since the July 1996 sampling event; however, the groundwater flow direction and gradient have remained approximately the same. Consistent with historical monitoring results, free-phase product was found on the groundwater in Well W-19. Reported concentrations of TPH-diesel and TPH-oil have generally decreased since the July 1996 monitoring activities, with increased concentrations TPH-diesel and TPH-oil in only one of the six wells sampled. The detected TPH concentrations are generally within the range of concentrations detected in previous monitoring events. No PNAs were present in the groundwater samples.

Ms. Lynn Tolin

NOTES:

(1) Well W-1 is located on the Nielson property.

(2) Groundwater elevation taken from earlier reports does not agree with calculated elevation using current top of casing elevation.

(3) Well abandoned on October 8, 1996, therefore, no water-level measurement was collected.

feet MSL = Feet above Mean Sea Level.

NA = Data not available.

NM = Not measured.

NP = Product not present or insufficient amount present to perform measurements.

WCC = Woodward Clyde Consultants

MH = McLaren Hart

PES = PES Environmental, Inc.

GROUNDWATER SAMPLING REPORT 961030-F-1

Blaine Tech Services, Inc. performs specialized environmental sampling and documentation as an independent third party. In order to avoid compromising the objectivity necessary for the proper and disinterested performance of this work, Blaine Tech Services, Inc. does not participate in the interpretation of analytical results, or become involved with the marketing or installation of remedial systems.

This report deals with the groundwater well sampling performed by our firm in response to your request. Blaine Tech Services, Inc. resampled well W-20 due to underpurging at the first event. Data collected in the course of our work at the site are presented in the TABLE OF WELL MONITORING DATA. This information was collected during our inspection, well evacuation and sample collection. Measurements include the total depth of the well and the depth to water. Water surfaces were further inspected for the presence of immiscibles. A series of electrical conductivity, pH, and temperature readings were obtained during well evacuation and at the time of sample collection.

STANDARD PRACTICES

Evacuation and Sampling Equipment

As shown in the TABLE OF WELL MONITORING DATA, the wells at this site were evacuated according to a protocol requirement for the removal of three case volumes of water, before sampling. The wells were evacuated using bailers.

Samples were collected using bailers.

Bailers: A bailer, in its simplest form, is a hollow tube which has been fitted with a check valve at the lower end. The device can be lowered into a well by means of a cord. When the bailer enters the water, the check valve opens and liquid flows into the interior of the bailer. The bottom check valve prevents water from escaping when the bailer is drawn up and out of the well.

Two types of bailers are used in groundwater wells at sites where fuel hydrocarbons are of concern. The first type of bailer is made of a clear material such as acrylic plastic and is used to obtain a sample of the surface and the near surface liquids, in order to detect the presence of visible or measurable fuel hydrocarbon floating on the surface. The second type of bailer is made of Teflon or stainless steel, and is used as an evacuation and/or sampling device.

Bailers are inexpensive and relatively easy to clean. Because they are manually operated, variations in operator technique may have a greater influence than would be found with more automated sampling equipment. Also, where fuel hydrocarbons are involved, the bailer may include near surface contaminants that are not representative of water deeper in the well.

Decontamination

All apparatus is brought to the site in clean and serviceable condition. The equipment is decontaminated after each use and before leaving the site.

Effluent Materials

The evacuation process creates a volume of effluent water which must be contained. Blaine Tech Services, Inc. will place this water in appropriate containers of the client's choice or bring new 55 gallon DOT 17 E drums to the site, which are appropriate for the containment of the effluent materials. The determination of how to properly dispose of the effluent water must usually await the results of laboratory analyses of the sample collected from the groundwater

well. If that sample does not establish whether or not the effluent water is contaminated, or if effluent from more than one source has been combined in the same container, it may be necessary to conduct additional analyses on the effluent material.

Sampling Methodology

Samples were obtained by standardized sampling procedures that follow an evacuation and sample collection protocol. The sampling methodology conforms to both State and Regional Water Quality Control Board standards and specifically adheres to EPA requirements for apparatus, sample containers and sample handling as specified in publication SW 846 and T.E.G.D. which is published separately.

Sample Containers

Sample containers are supplied by the laboratory performing the analyses.

Sample Handling Procedures

Following collection, samples are promptly placed in an ice chest containing deionized ice or an inert ice substitute such as Blue Ice or Super Ice. The samples are maintained in either an ice chest or a refrigerator until delivered into the custody of the laboratory.

Sample Designations

All sample containers are identified with both a sampling event number and a discrete sample identification number. Please note that the sampling event number is the number that appears on our chain of custody. It is roughly equivalent to a job number, but applies only to work done on a particular day of the year rather than spanning several days, as jobs and projects often do.

Chain of Custody

Samples are continuously maintained in an appropriate cooled container while in our custody and until delivered to the laboratory under our standard chain of custody. If the samples are taken charge of by a different party (such as another person from our office, a courier, etc.) prior to being delivered to the laboratory, appropriate release and acceptance records are made on the chain of custody (time, date and signature of person accepting custody of the samples).

Hazardous Materials Testing Laboratory

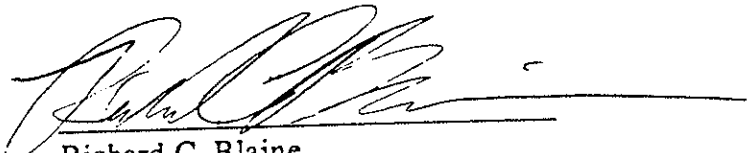

The samples obtained at this site were delivered to American Environmental Network in Pleasant Hill, California. AEN is certified by the California Department of Health Services as a Hazardous Materials Testing Laboratory, and is listed as DOHS HMTL #1172.

Personnel

All Blaine Tech Services, Inc. personnel receive 29 CFR 1910.120(e)(2) training as soon after being hired as is practical. In addition, many of our personnel have additional certifications that include specialized training in level B supplied air apparatus and the supervision of employees working on hazardous materials sites. Employees are not sent to a site unless we are confident they can adhere to any site safety provisions in force at the site and unless we know that they can follow the written provisions of an SSP and the verbal directions of an SSO.

In general, employees sent to a site to perform groundwater well sampling will assume an OSHA level D (wet) environment exists unless otherwise informed. The use of gloves and double glove protocols protects both our employees and the integrity of the samples being collected. Additional protective gear and procedures for higher OSHA levels of protection are available.

Please call if we can be of any further assistance.

PROJECT SUMMARY:

On October 30, 1996, this laboratory received 2 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. On November 5, 1996, client requested additional chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9610400

CLIENT PROJECT ID: EMERY BAY MRKT

Quality Control and Project Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

PROJECT SUMMARY:

On October 24, 1996, this laboratory received 4 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

Larry Klein
Laboratory Director

QUALITY CONTROL REPORT

AEN JOB NUMBER: 9610332

CLIENT PROJECT ID: EMERY BAY MARKET

Quality Control and Project Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

1.0 INTRODUCTION

This report presents the methods and findings of Aqua Science Engineers, Inc. (ASE)'s soil and groundwater assessment at the Lerer Brothers Transmission Service property located at 6340 Christie Avenue in Emeryville, California (Figure 1). The site assessment activities were initiated by Mr. Rick Gold of Lerer Brothers Transmission Service as required in a letter from the Alameda County Health Care Services Agency (ACHCSA) dated December 7, 1998 (Appendix A).

2.0 SITE HISTORY

One 2,000 gallon steel underground storage tank (UST) used to store unleaded gasoline was removed from the site in 1988. No verifiable records have been located regarding the UST removal.

On October 9, 1998, ASE drilled five soil borings at the site (Figure 2). Up to 1,400 parts per million (ppm) total petroleum hydrocarbons as gasoline (TPH-G), 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX (benzene, toluene, ethylbenzene and total xylenes) compound at concentrations below 1 ppm. None of the BTEX concentrations exceeded United States Environmental Protection Agency (US EPA) Region IX preliminary remediation goals (PRGs) for industrial soil. No methyl tertiary butyl ether (MTBE) was detected in any of the soil samples analyzed.

Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

3.0 SCOPE OF WORK (SOW)

Based on the site history and requirements of the ACHCSA, ASE's SOW was as follows:

- 1) Prepare a workplan and a health and safety plan for approval by the ACHCSA.
- 2) Obtain a drilling permit from the Alameda County Public Works Agency (ACPWA).
- 3) Drill three (3) soil borings to approximately 19-feet below ground surface (bgs) at the site.
- 4) Analyze at least one soil sample from each boring at a CAL-EPA certified analytical laboratory for TPH-G by modified EPA Method 5030/8015, BTEX and MTBE by EPA Method 8020 and lead by EPA Method 6010.
- 5) Install 2-inch diameter groundwater monitoring wells in each boring described in task 3.
- 6) Develop the monitoring wells.
- 7) Collect groundwater samples from each monitoring well for analyses.
- 8) Analyze the groundwater samples at a CAL-EPA certified analytical laboratory for TPH-G, BTEX, MTBE and dissolved lead.
- 9) Survey the top of casing elevation of each well, and determine the groundwater flow direction and gradient beneath the site.
- 10) Prepare a report detailing the methods and findings of this assessment.

Details of this assessment follow.

4.0 DRILLING SOIL BORINGS AND COLLECTING SAMPLES

Prior to drilling, ASE obtained an Alameda County Public Works Agency drilling permit (Appendix B). ASE also notified Underground Service Alert (USA) to have underground public utilities in the vicinity of the site marked prior to drilling.

On January 21, 1999, Kvilhaug Well Drilling of Concord, California drilled soil borings MW-1, MW-2 and MW-3 at the site using a Mobile B-61 drill rig equipped with 8-inch diameter hollow-stem augers (Figure 3). Groundwater monitoring wells MW-1, MW-2 and MW-3 were subsequently

constructed in these borings. These locations were chosen to monitor groundwater adjacent to and downgradient of the former UST. The groundwater flow direction was assumed to be to the west based on ASE's knowledge of regional groundwater flow as well as conversations with Ms. Susan Hugo of the ACHCSA, the case worker for several sites in the site vicinity. The drilling was directed by ASE staff geologist Greg Schramm and ASE senior geologist Robert E. Kitay, R.G.

Undisturbed soil samples were collected at 5-foot intervals as drilling progressed for lithologic and hydrogeologic description and for possible chemical analyses. The samples were collected by driving a split-barrel drive sampler lined with 2-inch diameter brass tubes ahead of the auger tip with successive blows from a 140-lb. hammer dropped 30-inches. One tube from each sampling interval was immediately trimmed, sealed with Teflon tape, plastic end caps and duct tape, labeled, sealed in a plastic bag and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP #1094) under chain of custody. Soil from the remaining tubes was described by the site geologist using the Unified Soil Classification System.

Drilling equipment was steam-cleaned prior to use, and sampling equipment was washed with a TSP solution between sampling intervals to prevent cross-contamination. Rinsate was contained on-site in sealed and labeled 55-gallon steel drums.

Sediments encountered during drilling generally consisted of silty or gravelly sand with abundant debris such as tar, tar paper, roofing shingle material, railroad ties and railroad spikes. Hydrocarbon odors were present in all three borings, including strong odors at times. Groundwater was encountered between 3.7 and 6.5-feet bgs. The boring logs and well construction details are included as Appendix C. Based on conversations with Ms. Hugo of the ACHCSA, this type of fill material is very common in the site vicinity. She also stated that there may have been a tar or asphalt plant in the immediate site vicinity.

Drill cuttings were contained in sealed and labeled 55-gallon steel drums and stored on-site for temporary storage until off-site storage can be arranged.

5.0 ANALYTICAL RESULTS FOR SOIL

The soil sample collected from 4.5-foot bgs in each boring was analyzed by Chromalab, Inc. for TPH-G by modified EPA Method 5030/8015, BTEX

and MTBE by EPA Method 8020 and total lead by EPA Method 7420. The analytical results are tabulated in Table One, and a copy of the certified analytical report and chain of custody form are included in Appendix D.

TABLE ONE
Summary of Chemical Analysis of SOIL Samples
All results are in parts per million

Boring	Depth Sampled	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE	Total Lead
MW-1	4.5'	< 100*	< 6.2	< 6.2	13	27	< 6.2	130
MW-2	4.5'	< 1.0	< 0.0050	< 0.0050	< 0.0050	< 0.0050	< 0.0050	49
MW-3	4.5'	< 1.2	< 0.005	< 0.005	0.0073	0.027	< 0.005	72
PRG		NE	0.62	520	230	210	NE	130

Notes:

Non-detectable concentrations are noted by the less than symbol (<) followed by the detection limit.

Detectable concentrations are in **bold**.

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 1,500 parts per million.

PRG is the United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goal (PRG) for residential soil.

None of the hydrocarbon or lead concentrations detected during this assessment exceeded US EPA PRGs for residential soil.

6.0 MONITORING WELL INSTALLATION, DEVELOPMENT AND SAMPLING

Groundwater monitoring wells MW-1, MW-2 and MW-3 were installed in borings MW-1, MW-2 and MW-3, respectively. The wells were constructed with 2-inch diameter, 0.020-inch slotted, flush-threaded, Schedule 40 PVC well screen and blank casing. Each well is screened between 3-feet bgs and the total depth of the well, between 15 and 19-feet bgs, to monitor the first water bearing zone encountered. Lonestar #3 Monterey sand occupies the annular space between the borehole and the casing from the bottom of the boring to approximately 1-foot above the well screen. A 0.5-foot thick hydrated bentonite layer separates the sand from the overlying cement surface seal. The wellheads are secured with locking wellplugs beneath at-grade traffic-rated vaults.

On January 24, 1999, ASE staff geologist Greg Schramm developed each monitoring well using at least two episodes of surge-block agitation and bailer evacuation. Over ten well casing volumes of water were removed from each well during development, and evacuation continued until the water was relatively clear.

On January 28, 1999, ASE staff geologist Greg Schramm collected groundwater samples from each monitoring well for analysis. A sheen was present on the surface of groundwater in all three monitoring wells. Prior to sampling, the wells were purged of four well casing volumes of groundwater. The pH, temperature and conductivity of the purge water were monitored during evacuation, and samples were not collected until these parameters stabilized. Samples were collected from the wells using pre-cleaned polyethylene bailers. The groundwater samples were decanted from the bailers into 40-ml volatile organic analysis (VOA) vials, preserved with hydrochloric acid and sealed without headspace. The samples for lead analysis were contained in 500-ml polyethylene bottles. All of the samples were labeled and stored on ice for transport to Chromalab, Inc. of Pleasanton, California under chain of custody. The laboratory was instructed to filter and preserve the samples for lead analysis immediately upon receipt. Well development and sampling purge water were contained in 55-gallon steel drums and stored on-site for temporary storage. See Appendix E for a copy of the Field Logs.

7.0 GROUNDWATER ELEVATIONS

ASE surveyed the top of casing elevation of each well relative to a site datum on January 28, 1999. An assumed site datum elevation of 10.00-feet above mean sea level (msl) was interpolated from the USGS Oakland West, California 7.5 Minute Quadrangle (1980). The top of casing elevation of monitoring well MW-1 was set at 10.00-feet and the top of casing elevations of monitoring wells MW-2 and MW-3 were surveyed relative to monitoring well MW-1. Depths to groundwater were measured in each well prior to sampling on January 28, 1999 with an electric water level sounder. Depth to groundwater measurements are presented in Table Two, and groundwater elevation (potentiometric surface) contours are plotted on Figure 4. On January 28, 1999, groundwater appeared to flow to the south beneath the site at a gradient of 0.0138-feet/foot.

TABLE TWO
Summary of Groundwater Well Survey Data

Well I.D.	Date of Measurement	Top of Casing Elevation (relative to project datum)	Depth to Water (feet)	Groundwater Elevation (project data)
MW-1	1-28-99	10.00	4.85	5.15
MW-2	1-28-99	9.96	4.17	5.79
MW-3	1-28-99	9.25	4.23	5.02

8.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015, BTEX and MTBE by EPA Method 8020 and dissolved lead by EPA Method 6010. The analytical results are tabulated in Table Three, and copies of the certified analytical report and chain of custody form are included in Appendix F.

TABLE THREE
Summary of Chemical Analysis of **GROUNDWATER** Samples
All results are in parts per billion

Well	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE	Dissolved Lead
MW-1	730	22	3.3	24	61	<5.0	<5.0
MW-2	710	20	180	14	67	<5.0	<5.0
MW-3	<50*	<0.5	<0.5	<0.5	0.69	<5.0	<5.0
DTSC MCL	NE	1.0	150	700	1,750	35**	15

Notes:

DTSC MCL is the California Department of Toxic Substances Control maximum contaminant level for drinking water.

NE = DTSC MCLs are not established.

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 68 parts per billion.
** = DTSC interim action level for drinking water; MCL not established.

Detectable concentrations are in **bold**.

Non-detectable concentrations noted by the less than sign (<) followed by the detection limit.

Benzene concentrations detected in groundwater samples collected from monitoring wells MW-1 and MW-2 exceeded the DTSC MCL for drinking water. The toluene concentration detected in groundwater samples collected from monitoring well MW-2 also exceeded the DTSC MCL for drinking water. Only very low concentrations of hydrocarbons, below DTSC MCLs for drinking water, were detected in groundwater samples collected from monitoring well MW-3. No lead was detected in groundwater samples collected from any of the monitoring wells.

9.0 CONCLUSIONS AND RECOMMENDATIONS

None of the hydrocarbon or lead concentrations detected in soil samples collected during this assessment exceeded US EPA PRGs for residential soil.

Benzene concentrations detected in groundwater samples collected from monitoring wells MW-1 and MW-2 exceeded DTSC MCLs for drinking water. The toluene concentration detected in groundwater samples collected from monitoring well MW-2 also exceeded the DTSC MCL for drinking water. No lead was detected in groundwater samples collected from any of the monitoring wells.

Based on the potentiometric surface contours, groundwater appears to flow to the south beneath the site at a gradient of 0.0138-feet/foot. This groundwater flow direction is not consistent with the expected groundwater flow direction to the west which was based on information provided by the ACHCSA and ASE's knowledge of regional groundwater in the Emeryville area.

Strong odors were present in soil encountered beneath the site, and a sheen was detected on the groundwater surface in the site monitoring wells. The analytical results do not indicate as significant contamination as field conditions would indicate. Based on this information, it appears that there is contamination beneath the site that is possibly related to the fill material beneath the site and not the former gasoline UST.

ASE recommends that groundwater samples be collected from the site wells on a quarterly basis. In addition, ASE recommends that water level measurements be collected from the site on a monthly basis for the next quarter to confirm the groundwater flow direction beneath the site. If the groundwater flow direction remains to the south, an additional groundwater monitoring well may be necessary downgradient of the former UST. The next groundwater sampling at the site is scheduled for April 1999. Lead analyses will be discontinued in future sampling periods.

10.0 REPORT LIMITATIONS

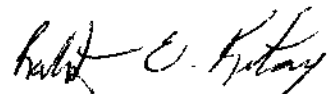

The results of this assessment represent conditions at the time of the soil and groundwater sampling, at the specific locations where the samples were collected, and for the specific parameters analyzed by the laboratory.

It does not fully characterize the site for contamination resulting from unknown sources, or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of an independent CAL-EPA certified laboratory. The independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

Aqua Science Engineers appreciates the opportunity to assist Lerer Brothers Transmission Service with their environmental needs. Should you have any questions or comments, please feel free to call us at (925) 820-9391.

Respectfully submitted,

AQUA SCIENCE ENGINEERS, INC.

Robert E. Kitay, R.G., R.E.A.
Senior Geologist

APPENDIX A	DRILLING PERMIT
APPENDIX B	ANALYTICAL REPORTS AND CHAIN OF CUSTODY FORMS FOR SOIL AND GROUNDWATER SAMPLES

1.0 INTRODUCTION

This report presents the methods and findings of Aqua Science Engineers, Inc. (ASE)'s soil and groundwater assessment at the Lerer Brothers Transmission Service property located at 6340 Christie Avenue in Emeryville, California (Figure 1). The site assessment activities were initiated by Mr. Rick Gold of Lerer Brothers Transmission Service to delineate the area of petroleum hydrocarbon contamination in soil and groundwater in the vicinity of the former underground storage tank (UST) in order to achieve case closure.

2.0 SITE HISTORY

One 2,000 gallon steel UST used to store unleaded gasoline was removed from the site in 1988. No verifiable records have been located regarding the UST removal.

3.0 SCOPE OF WORK (SOW)

Based on the site history and requirements of the Alameda County Health Care Services Agency (ACHCSA), ASE's scope of work was to:

- 1) Prepare a workplan for approval by the ACHCSA.
- 2) Obtain a drilling permit from the Alameda County Public Works Agency (ACPWA).
- 3) Drill five (5) soil borings at the site with a Geoprobe drill rig. Collect soil and groundwater samples from each boring.
- 4) Analyze one soil and one groundwater sample from each boring at a CAL-EPA certified analytical laboratory for TPH-G by modified EPA Method 5030/8015 and benzene, toluene, ethylbenzene and total xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by EPA Method 8020.
- 5) Backfill the borings with neat cement.
- 6) Prepare a report outlining the methods and findings of this assessment.

4.0 DRILL SOIL BORINGS AND COLLECT SAMPLES

Prior to drilling, ASE obtained a drilling permit from ACPWA. A copy of this permit is presented in Appendix A.

On October 9, 1998, Gregg Drilling of Martinez, California drilled soil borings BH-A through BH-E at the site using a Geoprobe hydraulic sampling rig (Figure 2). The drilling was directed by ASE staff geologist Greg Schramm and senior project manager David Allen.

Undisturbed soil samples were collected continuously as drilling progressed for lithologic and hydrogeologic description and for possible chemical analysis. The samples were collected by driving a sampler lined with acetate tubes using hydraulic direct push methods. Selective soil samples were immediately cut at the appropriate sampling interval, trimmed, sealed with Teflon tape, plastic end caps and duct tape, labeled, sealed in plastic bags and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP #1094) under chain of custody. Soil from the remaining tubes were described by the site geologist and was periodically screened for volatile compounds using an Organic Vapor Meter (OVM). The soil was screened by emptying soil from one of the sample tubes into a plastic bag. The bag was then sealed and placed in the sun for approximately 10 minutes. After the volatile compounds were allowed to volatilize, the OVM measured the vapor in the bag through a small hole punched in the bag. OVM readings are used as a screening tool only, since the procedures are not as rigorous as those used in the laboratory.

A temporary PVC well casing was driven into place in each boring for the collection of groundwater samples. Groundwater samples were removed from the borings with disposable polyethylene bailers. The groundwater samples were contained in 40-ml volatile organic analysis (VOA) vials (pre-preserved with hydrochloric acid) and capped without headspace. The samples were then labeled, placed in protective foam sleeves, and stored on ice for transport to Chromalab under chain of custody. Upon completion of the soil and groundwater sampling, the borings were backfilled with neat cement to the ground surface.

Drilling equipment was cleaned with a TSP solution between sampling intervals and between borings to prevent potential cross-contamination.

Sediments encountered during drilling generally consisted of up to three feet of a debris-free silty clay fill overlying a sandy fill material containing wood and asphalt shingle roofing material, brick and rubber to the total

depth explored of 8-feet below ground surface (bgs). No native soil was encountered. Groundwater was encountered at between 4 and 6 feet bgs and rose to approximately 4-feet bgs in each boring where it stabilized. Petroleum hydrocarbon odors and/or olive hydrocarbon staining were present in soil samples from borings BH-A, BH-B and BH-C. A hydrocarbon sheen was present on groundwater from boring BH-A. There were no obvious indications of hydrocarbons in borings BH-D and BH-E.

5.0 ANALYTICAL RESULTS FOR SOIL

One soil sample was collected from each boring for analysis. The soil sample chosen for analysis was collected from what appeared to be the capillary zone in each boring, just above completely saturated sediments. The samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015 and BTEX and MTBE by EPA Method 8020. The analytical results are tabulated in Table One, and the certified analytical report and chain of custody form are included in Appendix B.

TABLE ONE
Summary of Chemical Analysis of **SOIL** Samples
All results are in **parts per million**

Boring	Depth Sampled	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE
BH-A	6.0'	1,400	<6.2	25	7.1	15	<6.2
BH-B	3.5'	<1.0	0.0090	0.0083	0.012	0.039	<0.0050
BH-C	4.0'	<1.0	0.011	<0.0050	0.080	0.16	<0.0050
BH-D	4.0'	<1.0	<0.0050	<0.0050	<0.0050	0.0087	<0.0050
BH-E	5.5'	<1.0	<0.0050	<0.0050	<0.0050	<0.0050	<0.0050
PRG		NE	1.4	880	230	320	NE

Notes:

Detectable concentrations are in **bold**.

Non-detectable concentrations are noted by the less than sign (<) followed by the detection limit.

PRG is the United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goal (PRG) for industrial soil.

NE = US EPA PRG is not established.

The soil sample collected from 6.0-foot bgs in boring BH-A contained 1,400 parts per million (ppm) TPH-G, 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX compound at concentrations below 1 ppm. None of the BTEX concentrations detected at the site exceeded United States Environmental Protection Agency (US EPA) Region IX Preliminary Remediation Goals (PRGs) for industrial soil.

6.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples were analyzed by Chromalab for TPH-G by modified EPA Method 5030/8015 and BTEX and MTBE by EPA Method 8020. The analytical results are tabulated in Table Two, and the certified analytical report and chain of custody forms are included in Appendix B.

TABLE TWO
Summary of Chemical Analysis of **GROUNDWATER** Samples
All results are in **parts per billion**

Boring	TPH Gasoline	Benzene	Toluene	Ethyl Benzene	Total Xylenes	MTBE
BH-A	620,000	1,200	4,900	16,000	64,000	< 1,000
BH-B	40,000	280	110	3,200	6,400	< 250
BH-C	18,000	56	280	150	120	< 50
BH-D	< 50	< 0.5	< 0.5	< 0.5	< 0.5	< 5.0
BH-E	< 50*	< 0.5	< 0.5	< 0.5	1.2	< 5.0
DTSC MCL	NE	1.0	150	700	1,750	35**

Notes:

DTSC MCL is the California Department of Toxic Substances Control maximum contaminant level for drinking water.

NE = DTSC MCLs is not established.

* = Hydrocarbons uncharacteristic of gasoline detected in gasoline range at 98 parts per billion.

** = DTSC interim action level for drinking water. MCL not established.

Detectable concentrations are in **bold**.

Elevated hydrocarbon concentrations, including benzene, toluene, ethylbenzene and/or total xylene concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water, were detected in groundwater samples collected from the borings BH-A, BH-B and BH-C in the vicinity of the former UST at the site. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Up to 1,400 ppm TPH-G, 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX compounds at concentrations below 1 ppm. None of the BTEX concentrations exceeded US EPA PRGs for industrial soil. No MTBE was detected in any of the soil samples analyzed.

Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding DTSC MCLs for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

Based on these results, ASE anticipates that the ACHCSA will require further assessment activities, including the installation of three groundwater monitoring wells and at least one year of groundwater monitoring, prior to considering case closure at this site.

8.0 REPORT LIMITATIONS

The results of this assessment represent conditions at the time of the soil and groundwater sampling, at the specific locations where the samples were collected, and for the specific parameters analyzed by the laboratory.

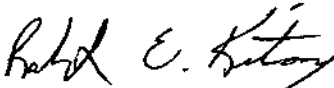

This report does not fully characterize the site for contamination resulting from unknown sources or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of an independent CAL-EPA certified laboratory. The

independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

Aqua Science Engineers appreciates the opportunity provide environmental consulting services for this project. Should you have any questions or comments, please feel free to call us at (925) 820-9391.

This report presents the results of the October 22, 1999 quarterly groundwater sampling and additional boring groundwater sampling for the above-referenced site. This sampling was conducted as required by the ACHCSA. ASE has prepared this report on behalf of Mr. Richard Gold, owner of the property.

2.0 DRILL TWO ADDITIONAL SOIL BORINGS AND COLLECT GROUNDWATER SAMPLES

Two soil borings were drilled on the neighboring property to the south to determine the extent of groundwater contamination downgradient of the site. Prior to drilling, ASE obtained an access agreement from the neighboring property owner, The Martin Group, to allow this drilling on their property. ASE also obtained a drilling permit from the Alameda County Public Works Agency (ACPWA). A copy of this permit is presented in Appendix A.

On October 22, 1999, Gregg Drilling of Martinez, California drilled soil borings BH-F and BH-G on The Martin Group property south of the site using a Geoprobe hydraulic sampling rig (Figure 2). These borings were drilled south of the former Underground Storage Tank (UST) to determine the extent of groundwater contamination downgradient of the UST. The drilling was directed by ASE associate geologist Ian Reed and senior geologist Robert E. Kitay, R.G.

Undisturbed soil samples were collected continuously as drilling progressed for lithologic and hydrogeologic description. No soil samples were retained for analysis. The samples were collected by driving a sampler lined with acetate tubes using hydraulic direct push methods. Soil was described by the site geologist using the Unified Soil Classification System. Boring logs are presented in Appendix B.

Groundwater samples were removed from the borings with a bailer. The groundwater samples were contained in 40-ml volatile organic analysis (VOA) vials, preserved with hydrochloric acid, and sealed without headspace. The samples were then labeled and stored on ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP 1094) under chain of custody. Upon completion of the groundwater sampling, the borings were backfilled with neat cement to the ground surface.

Drilling equipment was cleaned with a TSP solution between sampling intervals and between borings to prevent potential cross-contamination.

3.0 GROUNDWATER FLOW DIRECTION AND GRADIENT

On October 22, 1999, ASE environmental scientist Ian Reed measured the depth to water in each site groundwater monitoring well using an electric water level sounder. The surface of the groundwater was also checked for the presence of free-floating hydrocarbons or sheen. There was no free-

floating product or sheen present in any well. Current and historical groundwater elevation data is presented as Table One.

TABLE ONE
Groundwater Elevation Data

Well I.D.	Date of Measurement	Top of Casing Elevation (relative to project datum)	Depth to Water (feet)	Groundwater Elevation (project data)
MW-1	1-28-99	10.00	4.85	5.15
	3-29-99		4.85	5.15
	7-20-99		5.08	4.92
	10-22-99		5.08	4.92
MW-2	1-28-99	9.96	4.17	5.79
	3-29-99		3.89	6.07
	7-20-99		4.30	5.66
	10-22-99		4.36	5.60
MW-3	1-28-99	9.25	4.23	5.02
	3-29-99		4.41	4.84
	7-20-99		3.86	5.39
	10-22-99		3.94	5.31

A groundwater potentiometric surface map is presented as Figure 2. The groundwater flow direction is to the southeast with a gradient of approximately 0.014-feet/foot. This groundwater flow direction and gradient are consistent with historical groundwater flow direction and gradient data which consistently shows the groundwater flow beneath the site to the south or southeast.

4.0 GROUNDWATER SAMPLE COLLECTION AND ANALYSIS

Prior to sampling, each monitoring well was purged of four well casing volumes of groundwater using a dedicated bailer. Slight petroleum hydrocarbon odors were present during the purging and sampling of the groundwater monitoring wells. The parameters pH, temperature and conductivity were monitored during the well purging. Samples were not collected until these parameters stabilized. Groundwater samples were collected from each well using dedicated polyethylene bailers. The samples were decanted from the bailers into 40-ml VOA vials, preserved with hydrochloric acid, sealed without headspace, labeled and placed in coolers with wet ice for transport to Chromalab under appropriate chain-

of-custody documentation. Well sampling field logs are presented in Appendix C.

5.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples collected from all three groundwater monitoring wells, as well as from borings BH-F and BH-G, were analyzed for total petroleum hydrocarbons as gasoline (TPH-G) by EPA Method 5030/8015M, benzene, toluene, ethylbenzene and total xylenes (collectively known as BTEX) by EPA Method 8020 and methyl tertiary butyl ether (MTBE) by EPA Method 8020. The analytical results are presented in Table Two. The certified analytical report and chain-of-custody documentation are included as Appendix D.

Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and boring BH-F all exceeded the California Department of Health Services (DHS) maximum contaminant level (MCL) for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. Although the benzene concentrations exceeded the DHS MCL for drinking water, these concentrations are relatively low and would not be considered a threat to human health in non-drinking water scenarios. The hydrocarbon trends are relatively stable although there does appear to be a slight increasing trend in hydrocarbon concentrations in groundwater samples collected from monitoring well MW-1.

TABLE TWO
Certified Analytical Results of GROUNDWATER Samples
All results are in parts per billion

Well ID & Dates Sampled	TPH-G	Benzene	Toluene	Ethyl- benzene	Total Xylenes	MTBE	Lead
MW-1							
1-28-99	730	22	3.3	24	61	< 5.0	< 5.0
3-29-99	950	37	5.7	27	60	< 5.0	--
7-20-99	970	40	5.4	67	120	< 5.0	--
10-22-99	1,300	71	7.2	100	210	< 10	--

3-29-99	500	8.6	44	4.3	25	< 5.0	--
7-20-99	510	8.4	44	6.0	31	< 5.0	--
10-22-99	280	13	10	6.2	36	< 5.0	--
MW-3							
1-28-99	< 50*	< 0.5	< 0.5	< 0.5	0.69	< 5.0	< 5.0
3-29-99	130	1.9	8.2	1.4	7.1	< 5.0	--
7-20-99	170	< 0.5	1.9	< 0.5	0.89	< 5.0	--
10-22-99	70**	< 0.5	< 0.5	< 0.5	< 0.5	< 5.0	--
BH-F	65	1.2	< 0.5	1.4	2.4	< 5.0	--
BH-G	180**	< 1.0	< 1.0	1.5	9.1	< 10	--
DHS MCL	NE	1	150	700	1,750	13	15
EPA METHOD	5030/ 8015M	8020	8020	8020	8020	8020	6010

Notes:

* = Hydrocarbons uncharacteristic of gasoline detected in the gasoline range at 68 ppb.

** = Hydrocarbons detected do not match a gasoline standard.

-- = Not analyzed

NE = DHS MCL not established

DHS MCL = Department of Health Services maximum contaminant level for drinking water.

Non-detectable concentrations noted by the less than sign (<) followed by the laboratory detection limit.

4.0 CONCLUSIONS

The groundwater flow direction beneath this site is to the southeast at a gradient of 0.014 feet/foot, which is consistent with the historical groundwater flow direction and gradient beneath the site.

Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and boring BH-F all exceeded the DHS MCL for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. Although the benzene concentrations exceeded the DHS MCL for drinking water, groundwater in the site vicinity is not used for drinking water. In non-drinking water scenarios, these concentrations would be considered relatively low and not a threat to human health or the environment. The hydrocarbon trends are relatively stable although there does appear to be a slight increasing trend in hydrocarbon concentrations in groundwater samples collected from monitoring well MW-1.

5.0 RECOMMENDATIONS

Based on the relatively low hydrocarbon concentrations detected in groundwater samples collected during the one year of quarterly groundwater monitoring, the limited horizontal extent of hydrocarbons in groundwater, and the current commercial/industrial usage of the site, ASE recommends that the ACHCSA and RWQCB review this case for closure.

6.0 REPORT LIMITATIONS

The results presented in this report represent the conditions at the time of the groundwater sampling, at the specific locations where the groundwater samples were collected, and for the specific parameters analyzed by the laboratory. It does not fully characterize the site for contamination resulting from sources other than the former underground storage tanks and associated plumbing at the site, or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of independent CAL-EPA certified laboratory. The independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

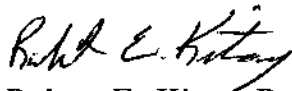

Aqua Science Engineers appreciates the opportunity to provide environmental consulting services to Lerer Brother Transmission Service, and trust that this report meets your needs. Please feel free to call us at (925) 820-9391 if you have any questions or comments.

SUBJECT: CASE CLOSURE REQUEST
Lerer Brothers Transmission Service
6340 Christie Avenue
Emeryville, California

Dear Ms. Drogos:

In May 2000, the Alameda County Health Care Services Agency (ACHCSA) agreed to close the above-referenced case once a deed restriction was put into place. The deed restriction was to exclude the site from use as residential, school, day care facilities and hospitals. The case worker at the time for the ACHCSA was Susan Hugo. My client, Mr. Richard Gold, the property owner, at the time decided to not sell the property and did not complete the deed restriction. Mr. Gold recently contacted ASE as he would like to pursue obtaining case closure for the site once again. His hope is to complete the case closure without a deed restriction if possible. The short term planned use of the property is a winery. The following is a brief history of the case:

SITE HISTORY

One 2,000 gallon steel underground storage tank (UST) used to store unleaded gasoline was removed from the site in 1988.

In October 1998, five soil borings were drilled at the site and soil and groundwater samples were collected. Up to 1,400 parts per million (ppm) total petroleum hydrocarbons as gasoline (TPH-G), 25 ppm toluene, 7.1 ppm ethylbenzene and 15 ppm total xylenes were detected in the soil sample collected from boring BH-A. No TPH-G was detected in soil samples collected from the remaining borings above detection limits. Soil samples collected from borings BH-B through BH-D contained one or more BTEX (benzene, toluene, ethylbenzene and total xylenes) compounds

at concentrations below 1 ppm. None of the BTEX concentrations exceeded United States Environmental Protection Agency (US EPA) Region IX preliminary remediation goals (PRGs) for industrial soil. No methyl tertiary butyl ether (MTBE) was detected in any of the soil samples analyzed. Groundwater samples collected from borings BH-A, BH-B and BH-C contained BTEX concentrations exceeding California Department of Toxic Substances Control (DTSC) maximum contaminant levels (MCLs) for drinking water. Very low to non-detectable hydrocarbon concentrations were detected in groundwater samples collected from borings BH-D and BH-E further away from the former UST location. No MTBE was detected in any of the groundwater samples analyzed.

In January 1999, monitoring wells MW-1, MW-2 and MW-3 were installed at the site. Sediments encountered during drilling generally consisted of silty or gravelly sand with abundant debris such as tar, tar paper, roofing shingle material, railroad ties and railroad spikes. Hydrocarbon odors were present in all three borings, including strong odors at times. Groundwater was encountered between 3.7 and 6.5-feet below ground surface (bgs). Soil samples collected during the monitoring well installation contained up to 13 ppm ethylbenzene, 27 ppm total xylenes and 130 ppm total lead. None of the hydrocarbon or lead concentrations detected exceeded US EPA PRGs for residential soil. Groundwater samples collected from the monitoring wells contained up to 730 parts per billion (ppb) TPH-G, 22 ppb benzene, 180 ppb toluene, 24 ppb ethylbenzene, and 67 ppb total xylenes. No dissolved lead or MTBE were detected in any of the groundwater samples collected. Groundwater appeared to flow to the south beneath the site at a gradient of 0.0138-feet/foot.

Groundwater samples were collected from the three site monitoring wells on a quarterly basis. The hydrocarbon concentrations were generally consistent over this period. Benzene concentrations in groundwater samples collected from monitoring well MW-1, the well with the highest hydrocarbon concentrations, ranged from 22 ppb to 71 ppb. Over this period, the groundwater flow direction was generally to the south or southeast.

In October 1999, ASE drilled soil borings BH-F and BH-G on The Martin Group property south and southeast of the site using a Geoprobe hydraulic sampling rig. These borings were drilled south of the former UST to determine the extent of groundwater contamination downgradient of the UST. Groundwater samples were also collected from the three site monitoring wells at this time. Benzene concentrations in groundwater samples collected from monitoring well MW-1, monitoring well MW-2 and

boring BH-F all exceeded the DHS MCL for drinking water. Concentrations of the other compounds detected did not exceed DHS MCLs for drinking water. The benzene concentration in the groundwater sample collected from boring BH-F was 1.2 ppb, which is just over the DHS MCL for drinking water and essentially defines the downgradient extent of contamination. Although the benzene concentrations exceeded the DHS MCL for drinking water, groundwater in the site vicinity is not used for drinking water. In non-drinking water scenarios, these concentrations would be considered relatively low and not a threat to human health or the environment.

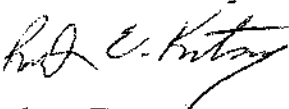

Following completion of the soil and groundwater assessment activities described above, the site groundwater monitoring wells were properly destroyed in May 2000 as approved by the ACHCSA in anticipation of case closure.

REQUEST FOR CASE CLOSURE

On behalf of Mr. Richard Gold, ASE requests that the ACHCSA review the file for the case to determine whether the case may be closed with the available information. If you have any questions, you can reach Robert Kitay of ASE at (925) 820-9391. Richard Gold can be reached at (650) 579-1919.

1. INTRODUCTION

1.1. PURPOSE

- Review past and current land use for indications of the manufacture, generation, use, storage and/or disposal of hazardous substances at the site;
- Evaluate the potential for site soil and/or groundwater contamination resulting from past and present land use activities and, to the extent possible, adjacent off-site operations;
- Render findings and professional opinion regarding the potential for environmental contamination at the site;
- If necessary, recommend further investigations to evaluate whether contamination, environmental hazards or special resource value concerns may exist at the locations identified.

1.2. INVOLVED PARTIES

JoAnn Copperud, Certified Environmental Inspector and Certified Asbestos Consultant with RGA Environmental, Inc. (RGA), conducted the Phase I site assessment update and the visual asbestos survey at the subject Property (Property). Karin Schroeter, Registered Environmental Assessor and California Certified Asbestos Consultant, reviewed the report.

2. SCOPE OF WORK

2.1. SCOPE

- Inspect and research all areas of the Property for evidence of potential hazards;
- Review previous Phase I site assessment report prepared by Tetra Tech and include their historical data and any modifications subsequent to their report dated May 31, 1994;
- Research and review information from local, state and federal environmental regulatory agencies and computerized databases concerning the subject Property and its neighbors;
- Identify suspect asbestos containing materials; and
- Submit final Phase I site assessment update report according to Sumitomo Bank's requested scope of work.

2.2. ASSUMPTIONS

The conclusions presented in this report are professional opinions based on the data described in this report. They are intended only for the subject site, and apply only to conditions existing at the time of our study. This report does not provide the level of detail necessary to be utilized for structural demolition or remodeling, or soil or ground water remediation. Changes in applicable standards can occur as the result of legislation or broadening knowledge which may invalidate, wholly or in part, the findings of this report. This report may contain records or database information misidentified by federal, state, or local agencies.

3. SITE OVERVIEW

3.1. PROPERTY LOCATION AND DESCRIPTION

The subject site (Property) is occupied by a one story concrete structure that is approximately 14,000 square feet in area. The building is subdivided into three (3) tenant unit, two of which front 64th Street and one which fronts Christie Avenue. Interior building materials include carpet over concrete slab, drywall, cove siding and exposed fiberglass batting ceilings. The roof was not accessible.

The building was constructed in 1966 and was extensively renovated in 1994. Based on the RGA site inspection conducted on September 27, 1996, the overall condition of the building was good.

3.2. ADJACENT PROPERTIES

The Property is located in a mixed-use area of commercial, light industrial, retail and residential. The immediately adjacent properties are as follows:

North:	Apartment complex
East:	Movie Theater complex, Emery Bay Market Place
South:	Commercial
West:	Transmission repair facility

4. SITE HISTORY AND OPERATIONS

4.1. SANBORN FIRE INSURANCE MAPS

Sanborn maps were ordered from the Sanborn Company through Environmental Data Resources, Inc. in Southport, CT. The following maps were reviewed by Tetra Tech.

- 1912: A fertilizer company was located south of the Property. The Property was not mapped.
- 1951: A paint manufacturer was located south of the Property. The Property was not mapped.

4.2. HISTORIC DOCUMENTATION.

The following historical topographic maps were reviewed by Tetra Tech:

- 1949: The subject Property does not appear to be developed. A highway is mapped approximately 600 feet west. Railroad tracks are located 600 feet to the east. Industrial buildings are located 700 feet to the south.
- 1959: Oil tanks, approximately 450 feet east, are indicated on the map.
- 1980: No significant changes from the previous map.

4.3. AERIAL PHOTOGRAPHS REVIEWED.

The following aerial photographs were reviewed by Tetra Tech :

- 1950: Grading activity is apparent at the subject Property. It appears that new roads are being graded in the general area. The surrounding areas to the east and south appear to be primarily industrial.
- 1974: The subject Property appears in its current configuration. The surrounding area is primarily industrial.
- 1981: No significant changes to previous photograph.

1992: The subject site as it appears in its current configuration. Significant changes in surrounding area with a decrease in industrial usage. Major apartment and movie complexes are visible on adjacent sites.

5. ENVIRONMENTAL SETTING

5.1. PHYSIOGRAPHIC FEATURES

The elevation at the subject Property is approximately 15 feet above mean sea level (MSL). Elevation differences at the subject Property are less than five feet. The U.S. Geological Survey (USGS) Oakland West Quadrangle shows that the topography in the vicinity of the subject Property slopes to the west-southwest. The nearest surface water is the San Francisco Bay located approximately 800 feet west of the subject Property.

5.2. SOILS AND GEOLOGIC CONDITIONS

The Property lies on the flatlands east of the San Francisco Bay. The Bay is a drowned valley which is thought to have originally formed by erosion by the ancestral Sacramento River and subsequently widened by subsidence and a rise in sea level. Quaternary (Pleistocene to recent) sediments deposited in what is now the Bay, include both shallow marine and continental deposits.

The surficial deposit in the area is known as "Bay Mud" and generally occurs in the low lying areas adjacent to the Bay. Bay Mud is composed of unconsolidated, olive gray, blue gray, or black silty clay. Bay Mud is typically highly plastic and varies from soft to stiff in consistency. Organic remains, such as shells and peat, are not uncommon. Permeability is generally low except where lenses of sand occur. Bay Mud is mainly derived from the sediment load carried by the Sacramento and San Joaquin Rivers and has been deposited in the Bay for almost 10,000 years.

According to Flatland Deposits of the San Francisco Bay Region, Bay Mud can be found underlying the subject Property. These recently deposited sediments consist of unconsolidated, water-saturated, plastic clay and silty clay rich in organic material. Artificial fill was used over Bay Mud prior to construction of the building on the Property. Fill is composed of dune sand, silt, clay, rock waste, man-made debris and organic waste.

5.3. GROUNDWATER CONDITIONS

The direction of ground water flow at the subject Property is expected to be toward the west-southwest based on topographic expression. Ground water gradient is reported to the

west at approximately four to seven feet below ground level at the Peterson Manufacturing site.

6. RESULTS OF INVESTIGATION

6.1. SITE INSPECTION AND OBSERVATIONS

On September 27, 1996 RGA conducted site inspections of the Property and surrounding areas. Visual inspection of the Property did not reveal the presence of petroleum products, monitoring wells, unusual odors, or drums.

6.2. ADJACENT SITE AND SITE VICINITY OBSERVATIONS

Visual inspection and observation made in the area of the Property revealed the presence of one apparently unlabeled 55 gallon drum on the adjacent Property to the south. The adjacent Property usage appeared to be automotive. At the time of the survey there was visual evidence of pavement staining on the south side of the Property. Monitoring wells were observed on the adjacent Property to the east approximately 400 feet southeast of the subject Property. No other evidence of improper hazardous materials use, storage, handling or disposal practices was noted in the drive-by inspection of surrounding areas.

6.3. REGULATORY AGENCY LIST REVIEW AND FILE SEARCH

6.3.1. NATIONAL PRIORITY LIST (NPL) - List is updated to May of 1996.

U.S. EPA maintains this list under the Comprehensive Environmental Response Compensation and Liability Act of 1980 (CERCLA) 42 U.S.C. Section 9601 (1985). Once sites have been designated on the CERCLIS List, U.S. EPA uses its Hazard Ranking System (HRS) to determine potential risks to human health and the environment. Only those CERCLIS sites which present the greatest risk are added to the NPL, which qualifies the sites to receive CERCLA remedial funding.

The subject Property and surrounding sites within a one mile radius are not listed.

6.3.2. CERCLIS - List is updated to May of 1996.

Since 1982, U.S. EPA has developed and maintained lists of contaminated properties under the federal Superfund program pursuant to the Comprehensive Environmental Response Compensation and Liability Act of 1980 (CERCLA), 42 U.S.C. Section 9601 (1985). U.S. EPA discovers these sites from citizen reports, routine inspection of hazardous waste generators, treatment, storage and disposal facilities, and reporting requirements.

The subject Property and surrounding sites within a one mile radius are not listed.

6.3.3. U.S. EPA RESOURCE CONSERVATION AND RECOVERY ACT (RCRA) - GENERATORS OF HAZARDOUS MATERIALS - List is updated to May of 1996.

This database report contains information pertaining to facilities which generate hazardous waste. Information pertaining to the status of facilities tracked by the RCRA Administrative Action Tracking System (RAATS). The database is inclusive of, but not limited to: conditionally exempt small quantity generators, small quantity generators, and large quantity generators. Under the Resource Conservation and Recovery Act, the EPA compiles a list of generators of hazardous waste materials. Generators in this classification are required to have U.S. EPA I.D. numbers on all waste manifest disposal records.

No adjacent properties were listed as small or large quantity generators. The neighboring automotive repair facility is not listed as a small or large quantity generator.

6.3.4. U.S. EPA RESOURCE CONSERVATION AND RECOVERY ACT (RCRA) - TSD FACILITIES - List is updated to May of 1996.

This database report contains information pertaining to facilities which either treat, store, or dispose of hazardous waste. Information pertaining to the status of facilities is tracked by the RCRA Administrative Action Tracking System.

The subject Property and surrounding sites within a one mile radius are not listed.

6.3.5. EMERGENCY RESPONSE NOTIFICATION SYSTEM (ERNS) - List is updated to December of 1995.

ERNS is a national database and retrieval system of Incident - Notification information as initially reported. Reported incidences include releases of oil and hazardous substances. Information is recorded in an ERNS database when a release is initially reported to the federal government by any party. Most of the information in ERNS is comprised of initial notifications, supplying preliminary information on a release and are cited as unverified data.

The subject Property is not listed on the ERNS database.

6.3.6. UNDERGROUND STORAGE TANKS LISTING - List is current to August 1994.

The State of California Water Resources Control Board (WRCB) in Sacramento provides a list of all permitted underground storage tanks containing hazardous substances. This database provides information on all registered underground storage tanks.

The subject Property and immediately adjacent sites are not listed in the database as having underground storage tanks.

6.3.7. LEAKING UNDERGROUND STORAGE TANKS - List is updated to April of 1996.

The Regional Water Quality Control Board (RWQCB) provides a list of all leaks of hazardous substances from underground storage tanks (LUSTs). This database provides information on contamination case types. There are 37 LUST sites within a half mile radius of the Property.

1. The EmeryBay Market Place located at 6426 Christie Avenue is adjacent and upgradient to the subject Property. The site was not discussed in the previous report conducted in June, 1994 . Information in the file at the RWQCB was from 1988. This site was contiguous with the Neilsen truck site which is located approximately 400 hundred feet south of the subject Property. All underground fuel and waste oil tanks were removed in 1987. At the time the survey was conducted, there was visual evidence of monitoring wells on the EmeryBay Market Place Property. The monitoring wells were located approximately 300 feet southeast of the subject Property. Based upon the proximity of the site, groundwater gradient and the depth to groundwater, it is possible there has been an adverse environmental impact to the subject site.
2. King Knight Co. located at 6202 Christie Avenue is approximately .092 miles southeast and crossgradient to the Property. The site was closed fo further remediation by the local regulatory agency on June 9, 1993. It is not expected to negatively impact the Property.
3. Chiron located 4300 Eastshore Highway is approximately .166 miles southwest and downgradient to the Property. It is not expected to negatively impact the Property.
4. PIE Nationwide Property located at 5500 Eastshore Highway is approximately .183 miles northwest and downgradient to the Property. It is not expected to negatively impact the Property.
5. Emery Bay Plaza/Bayfront located at 1650 65th Street is approximately .204 miles northwest and crossgradient to the Property. It is not expected to negatively impact the Property
6. Peterson Manufacturing Co. located at 1600 63rd Street is approximately .207 miles northeast and crossgradient to the Property. It is not expected to negatively impact the Property
7. Bay Center Project located at 1665 65th Street is approximately .208 miles northwest and crossgradient to the Property. It is not expected to negatively impact the Property

8. Wetherford BMW located at 5903 Christie Avenue is approximately .233 miles southwest and crossgradient to the Property. The site was closed by local regulatory on March 31, 1993. It is not expected to negatively impact the Property.
9. Ryerson Steel & Aluminium located at 1465 65th Street is approximately .248 miles northeast and crossgradient to the Property. It is not expected to negatively impact the Property
10. Lowenberg Corporation located at 1410 64th Street is approximately .249 miles southwest and downgradient to the Property. This site was closed fo further remediation on January 1, 1996. It is not expected to negatively impact the Property.
11. Hollis Street Project located at 6050 Hollis Street is approximately .250 miles northeast and upgradient to the Property. A groundwater investigation was conducted at the site following removal of a 500-gallon underground fuel tank in 1987. The site is currently undergoing quarterly groundwater monitoring. Based upon sampling results and distance from the subject Property this site is not expected to negatively impact the Property.
12. US Post Office located at 6121 Hollis Street #8 is approximately .251 miles northeast and upgradient to the Property. No data was available in the file.
13. Post Office located at 1505 62nd Street is approximately .252 miles southeast and crossgradient to the Property. No data was available in the file. Based on distance and groundwater gradient it is not expected to negatively impact the Property.
14. Nielsen Property located at 5800 Shellmound Street is approximately .262 miles southeast and crossgradient to the Property. This site is contiguous to the Emeryville Market Place Property. Based upon the groundwater gradient it is not expected to negatively impact the Property.
15. Fire Station No. 2 located at 6303 Hollis Street is approximately .277 miles northeast and crossgradient to the Property. It is not expected to negatively impact the subject Property.
16. Hydraulic Electro Service Corp. located at 5812 Hollis Street is approximately .278 miles southeast and crossgradient to the Property. It is not expected to negatively impact the subject Property.

The remainder of the LUST sites are unlikely to negatively impact the subject Property based on groundwater gradient or distance.

6.3.8. SOLID WASTE INFORMATION SYSTEM (SWF) - List is updated to April of 1996.

The California Waste Management Board maintains this list pursuant to the Solid Waste Management and Resources Recovery Act of 1972. The list contains an inventory of active, inactive and closed solid waste disposal and transfer facilities.

The subject Property and surrounding sites within a half mile radius are not listed.

6.3.9. CAL-SITES (HWS) - List is updated to April of 1996.

The California Department of Health Services (CDHS) compiled this database pursuant to Section 253596 of the California Health and Safety Code. The list contains information on potential hazardous waste sites that have been identified by the Historical Abandoned Site Survey Program. The CDHS researched a portion of the various state environmental agencies that could possibly help identify potential hazardous waste sites. Once sites are confirmed as hazardous sites, they may be merged into the database of the Cortese List and/or the Bond Expenditure Program (BEP). Names may remain on this list even though a determination has been made that no leak had occurred or that the CDHS is requiring "No Further Action" to protect the environment or public health.

81 sites are listed within a one mile radius, 61 of which are reported as requiring "No Further Action." The remainder of the sites are either hydrogeologically down or crossgradient from the subject Property or were reported in a separate database. It is unlikely any HSW sites have adversely impacted the subject Property.

6.3.10. CALIFORNIA OIL AND GAS WELL REPORT

The California Oil and Gas Well data report contains location and production information for all regulated oil and gas wells in the State of California

The subject Property and sites within a quarter mile radius are not listed.

6.4. SITE HISTORY/LAND USE REVIEW

6.4.1. CITY OF EMERYVILLE BUILDING DEPARTMENT

The City Building Department files were researched for original building construction permits. No original building records are kept on file, however RGA notified the Alameda County Assessors Office and their files indicate that the building was constructed in 1966.

6.4.2. CITY ZONING DEPARTMENT

The Property is zoned M-U - Mixed Use District (see appendices for copies of commercial district restrictions).

6.4.3. FLOOD ZONING

Based on a conversation with Maurice Kaufman, Civil Engineer for the City of Emeryville, The Property is in Flood Zone C, which is defined as "areas of minimal flooding".

6.4.4. CITY FIRE DEPARTMENT

The Fire Department in the City of Emeryville was contacted by written request. No information has been received to date concerning the presence of registered underground storage tank(s) or hazardous materials releases on the Property. Any information received that alters the conclusions presented in this report will be forwarded as an addendum.

6.4.5. COUNTY HEALTH DEPARTMENT

The Alameda County Department of Environmental Health Services Department was contacted regarding any hazardous materials on the Property. In August, 1986 a spill of concrete sealer contain xylene and polymeric resin in water was reported. The material had spilled into the concrete dock ramp area below grade on the north side of the facility, accumulated in a double-chamber five-sided concrete sump about 2 feet deep. The material was then pumped onto the asphalt by an automatic sump pump. The water/spill mixture was cleaned by a hazardous waste contractor and a total of eight drums of hazardous waste were manifested and removed from the site.

6.5. STATE DEPARTMENT OF HEALTH SERVICES

The State Department of Health Services, Toxic Substance Control was contacted regarding hazardous waste or hazardous substance releases at the subject Property. No records of reported toxic substance releases on the subject Property have been received from DHS.

6.6. PREVIOUS ENVIRONMENTAL INVESTIGATIONS

A previous environmental investigation was conducted on the Property by Tetra Tech in May, 1994. The conclusions of the previous report were:

- "No obvious signs of surface contamination, such as soil discoloration, dead vegetation, surface spills, or poor housekeeping were found within the subject Property."
- "Regulatory agency sites were identified within the vicinity that may have an effect on soil or ground water at the subject Property."

6.7. COMPREHENSIVE ASBESTOS SURVEY

Interior building materials include cove siding and drywall and associated joint compound. The subject Property was extensively remodeled in 1994, therefore it is extremely unlikely that any asbestos containing building materials were used as a part of the renovation activities.

6.8. PCBS

Light ballasts associated with fluorescent fixtures installed or replaced prior to 1979 may contain PCBs. Based upon the renovation dates of 1994, it is unlikely that light fixtures observed during the building survey contain PCB's. There was no evidence of pad-mounted transformers on the Property.

6.9. RADON

The Department of Environmental Health was contacted regarding radon concentrations in the city of Emeryville. There have been no reported cases of exposure to elevated levels of radon.

The EPA's Map of Radon Zones in California lists the Alameda County area as having average concentrations ranging between 2.0 and 4.0 picocuries per liter pCi/L. Currently the U.S. EPA recommends taking remedial action if the levels exceed 4.0 pCi/L.

7. CONCLUSIONS AND RECOMMENDATIONS

On September 27, 1996 JoAnn Copperud of RGA conducted an Environmental Site Investigation at 6390 Christie Avenue in Emeryville, California. The purpose of the inspection was to determine the potential for hazardous or toxic substance contamination originating from, or migrating to, the subject Property.

- An adjacent upgradient site is listed as a fuel release site. At the time the survey was conducted there was visual evidence of monitoring wells located approximately 300 feet southeast of the subject Property. Based upon distance, groundwater gradient and depth to groundwater it is possible there has been an adverse environmental impact to the subject Property.
- An adjacent site is currently used for automotive repair. At the time the survey was conducted, there was visual evidence of drums containing unknown quantities or types of materials and areas of visible staining. The Property is not listed as a small quantity hazardous waste generator. Work practices at the adjacent site could have an adverse environmental impact on the subject Property, however nothing was observed on the day of the survey.

- The subject Property is located in an area which has historically been used for industrial purposes.
- The subject Property has been developed since 1966. The building was extensively renovated in 1994.
- At the time of the survey, there was no known pending environmental regulatory action concerning the subject Property.
- Visual inspection and observation made at the subject site did not reveal the presence of urea formaldehyde insulation; drums containing unknown quantities or types of hazardous or solid wastes; material spills; chemicals or other raw materials; pits or sumps; stressed vegetation; unusual or noxious odors; on-site storage tanks, oil wells, disposal wells, dry wells or monitoring wells. There was no sign of unusual discharges, discolored flowing or ponded water, cisterns, septic tanks, or unnatural fill.

8. LIMITATIONS

The conclusions presented in this report are professional opinions based on the data described in this report. They are intended only for the subject site, and apply only to conditions existing at the time of our study. This report does not provide the level of detail necessary to be utilized for structural demolition or remodeling, or soil or ground water remediation. All analyses are based upon available information.

Changes in applicable standards can occur as the result of legislation or broadening knowledge which may invalidate, wholly or in part, the findings of this report. This report may contain records or database information mis-identified by federal, state, or local agencies. RGA is not responsible for database or record errors or omissions.

California Health and Safety Code requires that information be given regarding commercial and public buildings in which asbestos-containing materials are known to be present. Under this law, owners of such buildings may be required to notify their employees and contractors who work in those buildings of the asbestos-containing materials found within, and may be required to send a copy of the notice to tenants, subtenants and others with whom such owners are in contact.

The reader should be aware that the strict interpretation of the Federal Comprehensive Emergency Response and Compensation Liability Act (CERCLA) and case law may hold the landowner responsible for any toxic liability including future cleanup costs. This statement is not motivated by any condition of the subject Property but as a general statement of the advisability that Property owners and purchasers exercise all appropriate precautions to hazardous materials risks.

(ERIIS)**

ERIIS DISCLAIMER

The information contained in this report has been obtained from publicly available sources and other secondary sources of information produced by entities other than Environmental Risk Information & Imaging Services (ERIIS). Although great care has been taken by ERIIS in compiling and checking the information contained in this report to insure that it is current and accurate, ERIIS disclaims any and all liability for any errors, omissions, or inaccuracies in such information and data, whether attributable to inadvertence or otherwise, and for any consequences arising therefrom. The data provided hereunder neither purports to be nor constitutes legal or medical advice. It is further understood that ERIIS MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND, INCLUDING, BUT NOT LIMITED TO, THE WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE OF MERCHANTABILITY, NOR ANY SUCH REPRESENTATIONS OR WARRANTIES TO BE IMPLIED WITH RESPECT TO THE DATA FURNISHED, AND ERIIS ASSUMES NO RESPONSIBILITY WITH RESPECT TO CUSTOMER'S, ITS EMPLOYEES', CLIENTS', OR CUSTOMERS' USE THEREOF. ERIIS SHALL NOT BE LIABLE FOR ANY SPECIAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES RESULTING, IN WHOLE OR IN PART, FROM CUSTOMER'S USE OF THE DATA. Liability on the part of the Environmental Risk Information & Imaging Services (ERIIS) is limited to the monetary value paid for this report. The report is valid only for the geographical parameters specified on the cover page of this report, and any alteration or deviation from this description will require a new report. This report does not constitute a legal opinion.

ERIIS REPORT OVERVIEW

The following features are available for an ERIIS report:

- * Database Report
 - * Statistical Profile
 - * Database Records
- * Related Maps
 - * Digital Custom Plotted Map
 - * Sanborn Fire Insurance Map(s)
 - * Topographical Map(s)

Statistical Profile

The statistical profile is an at-a-glance numeric summary of the databases searched for your ERIIS Report.

Database Records

The detailed federal and state database information indicates potential and actual environmental threats within the study radius. These records are sorted by their distance from the study site.

Digital Custom Map

The digital custom map is cross referenced with the database records. The cross-in-circle in the center of the map represents the study site. The red circles represent distances from the study site. The plottable sites in the report are distinguished on the map by symbols of different shape and color.

Historic Fire Insurance Maps

The ERIIS collection of historical Sanborn Fire Insurance Maps covers 14,000 cities and towns. These maps may indicate prior use of the study site. If no maps are available for the study site, a notice to that effect is included. This notice should serve as evidence of due diligence.

Topographical Map

USGS topographical maps show natural and man-made features as well as the shape and elevation of the terrain. The 7.5 minute quad maps are produced at a scale of 1:24,000, or one inch represents 2,000 feet.

Radon Zone Level: 2

Zone 2 has a predicted average indoor screening level ≥ 2 pCi/L and ≤ 4 pCi/L

A Radon Zone should not be used to determine if individual homes need to be tested for radon. The EPA's Office of Radiation and Indoor Air (202/233-9320) recommends that all homes be tested for radon, regardless of geographic location or the zone designation in which the property is located.

**A property is defined as a .05 mile buffer around the site's latitude and longitude.

A blank radius count indicates that the database was not searched by this radius per client instructions.

NR in a radius count indicates that the database cannot be reported by this search criteria due to insufficient and/or inaccurate addresses reported by a federal/state agency.

NPL

Date of Data: 05/01/1996
Release Date: 05/13/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
703/603-8881

National Priorities List

The NPL Report, also known as the Superfund List, is an EPA listing of uncontrolled or abandoned hazardous waste sites. The list is primarily based upon a score which the site receives from the EPA's Hazardous Ranking System. These sites are targeted for possible long-term remedial action under the Superfund Act of 1980.

RCRIS TS

Release Date: 06/10/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
202/260-4610

Resource Conservation and Recovery Information System - Treatment, Storage, And Disposal Facilities

The RCRIS TS Report contains information pertaining to facilities which either treat, store, or dispose of EPA regulated hazardous waste. The following information is also included in the RCRIS TS Report:

- Information pertaining to the status of facilities tracked by the RCRA Administrative Action Tracking System (RAATS)
- Inspections & evaluations conducted by federal and state agencies
- All reported facility violations, the environmental statute(s) violated, and any proposed & actual penalties
- Information pertaining to corrective actions undertaken by the facility or EPA
- A complete listing of EPA regulated hazardous wastes which are generated or stored on-site

CERCLIS

Date of Data: 05/01/1996
Release Date: 05/13/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
703/603-8730

Comprehensive Environmental Response, Compensation, and Liability Information System

The CERCLIS Database is a comprehensive listing of known or suspected uncontrolled or abandoned hazardous waste sites. These sites have either been investigated, or are currently under investigation by the U.S. EPA for the release, or threatened release of hazardous substances. Once a site is placed in CERCLIS, it may be subjected to several levels of review and evaluation, and ultimately placed on the National Priorities List (NPL). As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from the CERCLIS Database.

NFRAP

Date of Data: 05/01/1996
Release Date: 05/13/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
703/603-8881

No Further Remedial Action Planned Sites

The No Further Remedial Action Planned Report (NFRAP), also known as the CERCLIS Archive, contains information pertaining to sites which have been removed from the U.S. EPA's CERCLIS Database. NFRAP sites may be sites where, following an initial investigation, either no contamination was found, contamination was removed quickly without need for the site to be placed on the NPL, or the contamination was not serious enough to require federal Superfund action or NPL consideration.

RCRIS LG

Date of Data: 05/10/1996
Release Date: 06/10/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
202/260-4610

Resource Conservation and Recovery Information System - Large Quantity Generators

The RCRIS LG Report contains information pertaining to facilities which either generate more than 1000kg of EPA regulated hazardous waste per month, or meet other applicable requirements of the Resource Conservation And Recovery Act. The following information is also included in the RCRIS LG Report:

- Information pertaining to the status of facilities tracked by the RCRA Administrative Action Tracking System (RAATS)
- Inspections & evaluations conducted by federal and state agencies
- All reported facility violations, the environmental statute(s) violated, and any proposed & actual penalties
- Information pertaining to corrective actions undertaken by the facility or EPA
- A complete listing of EPA regulated hazardous wastes which are generated or stored on-site

RCRIS SG

Date of Data: 05/10/1996
Release Date: 06/10/1996
US Environmental Protection Agency
Office of Solid Waste and Emergency Response
202/260-4610

Resource Conservation and Recovery Information System - Small Quantity Generators

The RCRIS SG Report contains information pertaining to facilities which either generate between 100kg and 1000kg of EPA regulated hazardous waste per month, or meet other applicable requirements of the Resource Conservation And Recovery Act. On advice of the U.S. EPA, ERIIS does not report so-called "RCRA Protective Filers." Protective Filers, commonly called Conditionally Exempt Small Quantity Generators (CESQG's), are facilities that have completed RCRA notification paperwork, but are not, in fact, subject to RCRA regulation. The determination of CESQG status is made by the U.S. EPA. The following information is also included in the RCRIS SG Report:

- Information pertaining to the status of facilities tracked by the RCRA Administrative Action Tracking System (RAATS)
- Inspections & evaluations conducted by federal and state agencies
- All reported facility violations, the environmental statute(s) violated, and any proposed & actual penalties

Emergency Response Notification System - 1995

ERNS is a national computer database system that is used to store information concerning the sudden and/or accidental release of hazardous substances, including petroleum, into the environment. The ERNS Reporting System contains preliminary information on specific releases, including the spill location, the substance released, and the responsible party. Please note that the information in the ERNS Report pertains only to those releases that occurred between January 1, 1995 and December 31, 1995.

FINDS

Date of Data: 05/10/1996
Release Date: 06/10/1996
US Environmental Protection Agency
Office of Information Resources Management
800/908-2493

Facility Index System

The FINDS Report is a computerized inventory of all facilities that are regulated or tracked by the U.S. Environmental Protection Agency. These facilities are assigned a unique identification number which serves as a cross-reference for other databases in the EPA's Program System. Each FINDS record indicates the EPA Program Office which is responsible for the tracking of the facility.

OPENDUMP

Open Dumps Report

The Resource Conservation and Recovery Act defines the term "Open Dump" to mean "...any facility or site where solid waste is disposed of which is not a sanitary landfill which meets the criteria promulgated under Section 4004 and which is not a facility for the disposal of hazardous waste." Thus, any facility which fails to comply with any one element of the criteria is considered to be an Open Dump.

California Calsites

The California CalSites Report contains information pertaining to potentially contaminated hazardous waste sites. Sites formerly listed in the Annual Workplan (AWP), the Abandoned Sites Project Information System (ASPIS), and the Bond Expenditure Plan (BEP) are now included in the CalSites Database. Of the 26,000+ sites listed within CalSites, approximately 16,000 sites are listed as "No Further Action". Further, only about 300+ sites listed within the CalSites database are confirmed and active hazardous substance release sites.

California Leaking Underground Storage Tank Report

The California LRST Report contains information pertaining to reported leaking underground storage tanks within the State of California. ERIIS has obtained the LUSTIS information from the California EPA and the LUST lists from each of the Regional Water Quality Control Boards. The dates of the information for each of the regions are as follows:
Region 1 - North Coast Region - 03/21/96 - (707) 576-2220
Region 2 - San Fran. Bay Region - 03/05/96 - (510) 286-1255
Region 3 - Central Coast Region - 03/13/96 - (805) 549-3147

Unplottable Sites

The remaining report pages list additional environmental sites that have been selected based on geographic criteria unique to your study site. They are classified as "unplottable sites" and require further investigation to assess their potential impact on your site.

How to Evaluate Unplottable Sites

Step 1

Streets Within the Radius: the following page is an alphabetical index of all streets that intersect or are contained within the largest study radius (usually one mile).

Step 2

Cross-Reference: use the "Streets Within the Radius" index to cross-reference the unplottable sites. For example, if Maple Avenue and Oak Avenue are listed in the street index, then any unplottable sites with a Maple Avenue or Oak Avenue address should be checked for possible impact on study site.

Questions on ERIIS' Proprietary Geocoding?

We're happy to answer any questions you might have about our data processing and **point-geocoding** (assigning a latitude and longitude to each address). Just give us a call on our toll-free number at (800) 989-0402 and let us know what state you're calling from. Our customer service staff is available from 8 a.m. to 8 p.m. (EST).

The ASTM Standard Practice For Environmental Site Assessments

As stated in the recently published **Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process** (E1527) by the American Society for Testing and Materials (ASTM):

"For large databases with numerous facility records (such as RCRA hazardous waste generators and registered underground storage tanks), the records are not practically reviewable unless they can be obtained from the source agency in the smaller geographic area of ZIP code (3.3.24)."

Therefore, this Report contains information available by latitude/longitude or by ZIP code. If your research requires environmental records for which only city or county information is available (i.e., no valid street or ZIP code) ERIIS will include this data at no extra charge.

APPENDIX 2)
ZONING INFORMATION

ARTICLE 9-4.36

M-U MIXED USED DISTRICT

Sections:

9-4.36.1	Title and Purpose.
9-4.36.2	Uses: Permitted.
9-4.36.3	Uses: Subject to Conditional Use Permit.
9-4.36.4	Uses: Accessory.
9-4.36.5	Uses: Type of Structures.
9-4.36.6	Standards: Density/Intensity.
9-4.36.7	Standards: Height.
9-4.36.8	Standards: Yards and Coverage.
9-4.36.9	Standards: Landscaping, Buffering, and Screening.
9-4.36.10	Standards: Off-Street Parking and Loading.
9-4.36.11	Standards: Special Provisions.
9-4.36.12	Standards: Mixed Uses.
9-4.36.13	Standards: Live/Work Space.
9-4.36.14	Standards: Performance.
9-4.36.15	Standards: Signs.
9-4.36.16	Procedures: General.

Section 9-4.36.1 Title and Purpose. Article 9-4.36 establishes the Mixed Use District, also known as the M-U District, and prescribes use types and other regulations for this district. Any applicable overlay districts described in Articles 9-4.40 through 9-4.49 may impose regulations in addition to those for this district. The purpose of the regulations for this district is to implement policies contained in the Community Development component of the General Plan, particularly policies prescribed by the Mixed Use land use category.

Section 9-4.36.2 Uses: Permitted. The following use types shall be permitted:

- (a) Residential. None.
- (b) Civic. Essential Services.
- (c) Commercial. None.
- (d) Industrial. None.

Section 9-4.36.3 Uses: Subject to Conditional Use Permit. The following types shall be permitted subject to obtaining a conditional use permit:

- (a) Residential. Family Residential:
 - Two-Family
 - Multi-Family
 - Group Residential

- (b) Civic.
 - Administrative Services
 - Community Education
 - Community Recreation
 - Convalescent Services
 - Cultural and Library Services
 - Day Care Services: Day Care Center
 - Group Care
 - Hospital Services
 - Major Public Services
 - Park and Recreation
 - Public Parking Services
 - Religious Assembly
 - Safety Services
 - Utility Services

- (c) Commercial.
 - Administrative and Business Offices
 - Animal Sales and Services:
 - Grooming and Pet Services
 - Veterinary
 - Automotive and Equipment:
 - Automotive Rentals
 - Automotive Sales
 - Commercial Parking
 - Business and Professional Support
 - Building Maintenance Services
 - Commercial Recreation:
 - Amusement Center
 - Indoor Entertainment
 - Indoor Sports and Recreation
 - Outdoor Entertainment
 - Outdoor Sports and Recreation
 - Construction Sales and Services
 - Convenience Sales and Services
 - Eating and Drinking Establishments:
 - Convenience
 - Full Service
 - Financial Services
 - Food and Beverage Retail Sales
 - Gasoline Sales
 - Lodging Services
 - Medical Services
 - On-Premise Liquor Sales

Personal Services
Professional Services
Repair Services
Research Services
Retail Sales:
 General
 Used and Seconds
Transportation Services

- (d) Industrial. Custom Manufacturing
High Technology
Light Manufacturing
Laundry Services
Wholesaling and Distribution: Light

Section 9-4.36.4 Uses: Accessory. Accessory uses and structures are subject to the provisions of Article 9-4.5.

Section 9-4.36.5 Uses: Type of Structures.

- (a) Open Storage. All open storage shall require a conditional use permit pursuant to Article 9-4.82.
- (b) Drive-In Facilities. All drive-in facilities shall require a conditional use permit pursuant to Article 9-4.82.
- (c) Multi-Tenant Facilities. All multi-tenant facilities shall require a conditional use permit pursuant to Article 9-4.82.

Section 9-4.36.6 Standards: Density/Intensity.

- (a) Floor-Area Ratio. The floor area ratio of building(s) other than dwellings shall be as prescribed on the adopted Building Intensity map.
- (b) Residential Density. The maximum allowable number of dwelling units per gross acre in this district shall be forty-five (45); provided, however, that the density may be increased to sixty (60) with a conditional use permit pursuant to Article 9-4.82.
- (c) Minimum Building Site Area. There is no minimum building site area in the M-U District.

Section 9-4.36.7 Standards: Height.

- (a) Maximum Building Height. The height of buildings and structures in this district shall be as prescribed on the adopted Building Height map.

- (b) General Requirements. The general requirements for height of buildings and structures are contained in Article 9-4.52.

Section 9-4.36.8 Standards: Yards.

- (a) General Requirements. The requirements for yards in this section shall be in addition to the general yard requirements contained in Article 9-4.53.
- (b) Yards. Front, side, and rear yards shall not be required in the Mixed Use (M-U) District, except as follows:
- (1) Where the side of a lot abuts property in a residential district (R-M or R-H), the side yard shall not be less than ten (10) feet, plus an additional two (2) feet of setback shall be required for each one (1) foot by which the height of the building on the commercial lot exceeds three (3) stories.
 - (2) Where the rear of a lot abuts property in a residential district, the rear yard shall be not less than ten (10) feet, plus an additional two (2) feet of setback shall be required for each one (1) foot by which the height of the building on the commercial lot exceeds three (3) stories.
 - (3) Where the street frontage of a lot is adjacent to property in a residential district, the front yard depth or side yard width on the street side adjacent to the residential district shall be not less than that required for the residential district.
 - (4) Where a lot has frontage on two (2) streets, and both such frontages are adjacent to property in a residential district, the front yard depth and the side yard width on the street sides adjacent to the residential district properties shall be not less than those required for the adjacent residential district.

Section 9-4.36.9 Standards: Landscaping, Buffering, and Screening. Landscaping, buffering and screening shall be provided pursuant to the provisions of Article 9-4.54.

Section 9-4.36.10 Standards: Off-Street Parking and Loading. Off-street parking and loading shall be provided pursuant to the provisions of Article 9-4.55.

Section 9-4.36.11 Standards: Special Provisions. Access to all off-street parking and loading areas shall conform with requirements of the City Engineer and shall be subject to modification during review of the site plan.

Section 9-4.36.12 Standards: Multiple Uses. The standards for multiple-use development are contained in Article 9-4.57.

Section 9-4.36.13 Standards: Live/Work Space. The standards for live/work space are contained in Article 9-4.58.

Section 9-4.36.14 Standards: Performance. All development shall be subject to the performance standards as set forth in Article 9-4.59.

Section 9-4.36.15 Standards: Signs. The standards for signs are contained in Article 9-4.61.

Section 9-4.36.16 Procedures: General. The procedures for obtaining permits and other approvals are contained in Articles 9-4.80 through 9-4.99.

AUG 18 1986
HAZARDOUS MATERIALS/
WASTE PROGRAM

August 14, 1986

Spill Response Report of August 13, 1986

Site: Fuller Brush Co. 6390 Christie Ave. Emeryville. CA
Material: Concrete sealer containing xylene and polymeric resin
in water.

The material had spilled into the concrete dock-ramp area below grade on the north side of the facility, accumulated in a double-chamber five-sided concrete sump about 2 feet deep and had then been pumped out onto the asphalt by the automatic sump pump.

Zero Waste Systems absorbed and cleaned up the water/spill mixture which had accumulated behind dykes of absorbent (installed by the Fire Department). We scraped up the thicker clumps of material which we thought might not evaporate to dryness, and swept and scrubbed up as much of the dried material as possible.

The storm drain in the parking lot contained about 6 inches of dirt which was contaminated with the xylene/resin mixture. We shovelled out the dirt, scraped the drain clear and cleaned the grate of dirt held up in the grid. The storm drain in the street was flowing with water and seemed to contain no significant residue, so it was left undisturbed.

The heaviest contamination was in the below grade ramp and the sump. The sump had floating concrete sealer in the pump chamber. This was bucketed out and solidified with the approximately 4 gals. of remaining product in the 5 gal. cans plus the crushed empty cans. The sump contents were then pumped out and solidified, the grates cleaned of dirt and the concrete scraped and scrubbed on the ramp and in the sump. The ramp area was then water-blasted into the sump and the walls of the sump then repeatedly water blasted and pumped out until no further concrete sealer was evident.

The area which the sump-pump out let pumped into was also water-blasted. All water, scrapings debris etc. was solidified with absorbent, drummed and manifested. The sump appears to continuously fill with subsurface water, filling up about every 16 hours or so. This leads us to conclude that there is no possible

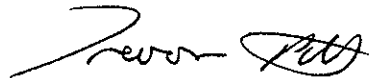

Page 2
Spill Response
August 14, 1986

groundwater contamination due to the spill. The sump water appears clean and odor-free as of 9:00 a.m. August 14, 1986.

On Alameda County Health Department advice, we informed Fuller Brush Co. that the remaining thin film of dried resin was non-hazardous and could be cleaned up with brushes, and that the electric sump pump could be turned back on. A total of eight drums of hazardous waste were generated and manifested (copy enclosed) and will be shipped today to the Casmalia disposal site. The cleanup total cost was approximately \$4,200.00. We found that Fuller Brush Co. was entirely helpful and cooperative. They did not understand the nature of the chemicals spilled or the environmental and legal implications of its entry into storm sewers or onto land surfaces.

Sincerely,

ZERO WASTE SYSTEMS by

Dear JoAnn Copperud:

Subject: Your Letter Dated **September 15, 1996** regarding property
located at **6390 Christie Avenue, Emeryville, CA 94608**

Upon reviewing the Department's calendar for routine file searches
it was determined that the Department will be able to provide your
organization the file(s) for your review on **September 26, 1996** at
9:00 AM. The file(s) will be available for review at the following
address:

County of Alameda
Environmental Health Services
1131 Harbor Bay Parkway
Suite No. 250
Alameda CA 94502

If it is necessary for you to have access to the requested file(s)
prior to the date and time indicated above, the Department may,
subject to staff availability, be able to provide Technical
Consultation Services. The fees currently charged by the
Department for file searches are contained in the enclosed
Departmental Public Records Search Policy.

Should you desire to schedule the file search prior to the date and
time indicated above, please contact me in writing at the address
indicated above or via FAX at (510) 337-9335.

Very truly yours,

Juliette Blake
File Search Coordinator

ALAMEDA COUNTY
DEPARTMENT OF ENVIRONMENTAL HEALTH

Public Records Search Policy

The following will be policy of the Department of Environmental Health regarding requests to inspect public records.

When the Department receives inquiry about a file, the requestor will be informed that they have the option of requesting an inspection of our files at a date and time established by the Department at no cost, or technical consultation of the record in question by the specialist assigned to the project. If the requestor wishes to only inspect the files, the Department will provide file oversight by clerical support staff and no technical answers will be provided. If a technical consultation is requested, the Department will make a Project Specialist available at a mutually agreed upon date and time to answer questions and explain the materials. The Project Specialist may also certify in writing, as appropriate, as to the completeness of the Departmental file(s) in question. The requestor should send the Department a letter stating their preferred method of file inspection and the authorizing of the appropriate fees, if any. Both public record's inspection and technical consultation may be limited or delayed by the availability of staff.

FEES:

The following fees will be assessed according to the request:

- (1) **For Inspecting a File . . .** No Fee
- (2) **For Copies:** Ten cents (\$0.10) per page for the reproduction of documents of 8.5" x 11" or 8.5" x 14". Reproduction charges for oversized documents (larger than 8.5" x 14") or any other copy media will be equivalent to the direct cost of duplication. Copy requests in excess of twenty (20) pages may be subject to a reasonable delay.
- (3) **For Technical Consultation** or any explanation of any materials in the file, a charge of \$94.00 per hour, or fraction thereof.

REQUESTS:

All requests should be submitted in writing and sent to:

APPENDIX B

CONSTRUCTION WORKER HEALTH & SAFETY PLAN

APPENDIX B

CONSTRUCTION WORKER HEALTH AND SAFETY PLAN REMEDATION WORK PLAN PROPOSED 64th AND CHRISTIE RESIDENTIAL BUILDING EMERYVILLE, CALIFORNIA

B1.0 INTRODUCTION

This Construction Worker Health and Safety Plan (HASP) has been prepared by PES Environmental, Inc. (PES) and describes the minimum health and safety requirements for planned site remediation activities at the properties located at 6340 and 6390 Christie Avenue (site).

Redevelopment plans consist of demolition of the existing structures and construction of a single reinforced concrete and steel building. The lowest level will be a subgrade parking area with a ground level consisting of additional parking, a leasing office, residences, and the lobby for the upper-floor residential units.

The subgrade parking level will be constructed approximately 10 feet below the existing ground surface and will be accessed by a ramp situated at the garage entrance along 64th Street. The footprint of the subgrade parking level, which encompasses the majority of the subject property, is shown in plan view and in cross-section on Plate 3. The proposed structure will be constructed atop the subgrade garage level and basically “float” above the existing ground surface. Narrow landscaped areas and concrete sidewalks fronting on 64th Street and Christie Avenue will be constructed at-grade.

In addition to the procedures and requirements described in this HASP, all onsite PES personnel shall follow applicable procedures and requirements specified by Federal, State, and local authorities to include those requirements specified in Title 8 of the California Code of Regulations, Section 5192 “Hazardous Waste Operations and Emergency Response” (T8-CCR, Section 5192). This HASP has been prepared to address the basic requirements of the overall safety and health program, with attention to those characteristics of site-specific activities. Any modifications made to this HASP because of encountered field conditions must be approved by the site-safety officer (SSO) and/or project manager (PM).

A copy of this HASP will be available at the site during all work activities.

B2.0 KEY PERSONNEL AND RESPONSIBILITIES

B2.1 Key Personnel and Qualifications

The PES Project Manager (PM) is James Dunn. The SSO is Mitch Buttress, or a designated alternate engineer, geologist, or environmental specialist. The project field staff has completed 40 hours of comprehensive health and safety training, which meets the requirements of Title 29 CFR 1910.120, T8-CCR, Section 5192 and an 8-hour supervisory course in health and safety management, including training in site safety planning, emergency planning, and drilling safety. The PES corporate Health and Safety Officer (HSO) is Nick Pogoncheff. Documentation for all training completed by PES personnel is available from the HSO on request.

B2.2 Responsibilities

The PM is responsible for the preparation and review of this HASP for accuracy and incorporating new information or guidelines, which aid the SSO in further definition and control of the potential health and safety hazards associated with the project. The PM and SSO are responsible for assuring that adequate training and safety briefing(s) for the project are provided to the project team. The PM or SSO will provide a copy of this HASP to each member of the project field team. The HSO is responsible for coordinating the PES corporate health and safety program. The SSO's responsibilities also include:

- Following the HASP;
- Reporting to the PM any unsafe conditions or practices;
- Reporting to the PM all facts pertaining to incidents which result in injury or exposure to toxic materials; and
- Reporting to the PM all equipment malfunctions or deficiencies.

The SSO has onsite responsibility for ensuring that all PES team members comply with the HASP. Immediately prior to initiating field activities, the SSO will conduct a tailgate briefing session for PES personnel and subcontractors to discuss PES' HASP and the procedures contained herein. Subcontractors will be responsible for complying with the minimum requirements specified in this HASP. It is the SSO's responsibility to inform field personnel of chemical and physical hazards as he or she becomes aware of them. The SSO has the authority to monitor and correct health and safety problems as noticed onsite to include "Stop Work". Additional SSO responsibilities include:

- Providing site safety briefings for PES team members;
- Updating equipment or procedures to be used based on new information gathered during the site investigation;

- Inspecting all personal protective equipment (PPE) for PES team members prior to onsite use;
- Making sure a first aid kit is available in work areas and that it is fully stocked;
- Assisting the PM in documenting compliance with the HASP by completing the standard PES forms;
- Assisting in and evaluating the effectiveness of decontamination procedures for personnel, protective equipment, sampling equipment and containers;
- Enforcing the “buddy” system as appropriate for site activities;
- Supplying phone numbers, location and route to the nearest medical facility, and arranging for emergency transportation if necessary;
- Enforcing the conditions of the access agreement with the property owners;
- Stopping operations that threaten the health and safety of the field team;
- Entering the exclusion area in emergencies after notifying emergency services; and
- Observing PES field team members for signs of exposure, stress, or other conditions related to preexisting physical conditions or site work activities.

B3.0 EMERGENCY PROCEDURES

A first aid kit will be available at the site for minor injuries. If an injury is sustained that is not minor, site personnel should: (1) contact off site medical help (see below); and (2) contact the PES PM or any available PES Principal.

If offsite medical or other emergency assistance is required, the following telephone numbers can be used:

Emeryville Fire Department: 911

Emeryville Police Department: 911

Hospital: Alta Bates Summit Medical Center
350 Hawthorne Avenue
Oakland, California 94609-3100
(510) 655-4000

Route to Hospital (also shown on attached Google map) (3.4 mi – about 6 minutes):

From: Site

6340 and 6390 Christie Ave
Emeryville, CA 94608

To: Alta Bates Summit Medical Center

350 Hawthorne Ave
Oakland, California

- | | | |
|---|---|--------|
| 1. Head south on Christie Ave toward Shellmound Way |  | 0.3 mi |
| 2. Turn right at Powell St |  | 0.1 mi |
| 3. Turn right at Frontage Rd |  | 440 ft |
| 4. Merge onto I-580 E/I-80 W via the ramp to San Jose/I-580/San Francisco
Continue to follow I-580 E |  | 2.2 mi |
| 5. Take the Webster St/Broadway-Auto Row exit |  | 0.6 mi |
| 6. Slight left at Webster St |  | 0.1 mi |
| 7. Turn right at Hawthorne Ave |  | 85 ft |

PES Corporate HSO: Nick Pogoncheff (415) 899-1600

B4.0 HAZARD EVALUATION

The potential hazards to personnel working at the site have been principally identified as chemical exposure and physical hazards of working in the vicinity of excavators and other heavy equipment. Each potential hazard relative to the potential for exposure is described below.

B4.1 Chemical Hazards

Based on the results of previous activities performed at the site, cleanup goals were determined for the following chemicals for site soil vapor, soil, and/or groundwater: total petroleum

hydrocarbons quantified as diesel, motor oil, and gasoline, (TPHd, TPHmo, and TPHg, respectively), benzene, toluene, ethylbenzene, total xylenes (BTEX), arsenic, cadmium, and lead. In addition, although not toxic, methane may be present at the site. Pertinent properties of these chemicals are as follow:

TPHd

LEL/UEL = 0.6/7.5 percent

TLV (TWA)/IDLH = not established

Hazard Properties = ignitable, toxic, volatile, carcinogenic

Exposure Routes = inhalation, skin absorption, and ingestion

Target Organs = central nervous system, skin, mucous membranes

Acute exposure symptoms = irritation, dizziness, loss of sense of smell

TPHmo

LEL/UEL = Not established

TLV (TWA)/IDLH = Not established

Hazard Properties = ignitable, toxic, volatile

Exposure Routes = inhalation, skin absorption, and ingestion

Target Organs = central nervous system, skin, mucous membranes

Acute exposure symptoms = irritation, dizziness

TPHg

LEL/UEL = 1.4/7.6 percent

Cal OSHA PEL / Short Term Exposure Limit³ (STEL)/IDLH = 300 / 500 /900 ppm

Hazard Properties = ignitable, toxic, volatile

Exposure Routes = inhalation, skin absorption, ingestion

Target Organs = skin, eyes, respiratory system, central nervous system

Acute exposure symptoms = cough, eye irritation, skin inflammation, central nervous system depression

Benzene

LEL/UEL = 1.2/7.8 percent

Cal OSHA Action Level / PEL / / STEL/IDLH = 0.5 / 1 / 5 /500 ppm

Hazard Properties = ignitable, toxic, volatile, carcinogen

Exposure Routes = inhalation, skin absorption and contact, ingestion

Target Organs = Respiratory system, skin, blood, central nervous system, bone marrow, eyes

Acute exposure symptoms = Irritated eyes, skin, nose and respiratory system; giddiness; headache, nausea, staggered gait; fatigue, anorexia, lassitude; dermatitis; bone marrow depression

³ An employee exposure to an airborne contaminant, expressed as a 15-minute time-weighted average concentration and shall not exceed the STEL specified above at any time during the workday.

Toluene

LEL/UEL = 1.1/7.1 percent

Cal OSHA PEL / Ceiling Limit / STEL / IDLH = 50 / 500 / 125 / 500 ppm

Hazard Properties = ignitable, toxic, volatile

Exposure Routes = Inhalation, skin absorption and contact, ingestion

Target Organs = Central nervous system; eyes; liver; kidneys

Acute exposure symptoms = Fatigue, weakness, confusion; euphoria, dizziness, headache; dilated pupils; insomnia; tears, dermatitis; liver, kidney damage

Ethylbenzene

LEL/UEL = 1.4/14 percent

Cal OSHA PEL / STEL /IDLH = 100 / 125 /800 ppm

Exposure Routes = inhalation, skin and eye contact, ingestion

Target Organs = Eyes, upper respiratory system, skin, central nervous system

Exposure Symptoms = Irritated eyes, skin, and mucous membranes; headache; dermatitis; sleepiness; narcosis; coma

Total Xylenes

LEL/UEL = 1.0/7.0 percent

Cal OSHA PEL / Ceiling Level / STEL //IDLH = 100 / 300 / 150 /1,000 ppm

Hazard Properties = ignitable, toxic, volatile

Exposure Routes = inhalation, skin absorption and contact, ingestion

Target Organs = Central nervous system, eyes; blood; liver, kidneys, Gastro-intestinal tract

Acute exposure symptoms = Dizziness, excitement, drowsiness, incoherence, staggering gait; irritated eyes, nose and throat; anorexia; nausea, vomiting, abdominal pain; dermatitis

Lead

LEL/UEL = NA

Cal OSHA Action Level / PEL /IDLH = 0.03 / 0.05 / 100 mg/m³

Hazard Properties = toxic

Exposure Routes = Inhalation, skin or eye contact, ingestion

Target Organs = eyes, gastrointestinal tract, central nervous system, kidneys, blood, gingival tissue

Acute exposure symptoms = weakness, low weight, constipation, abdominal pain, gingival lead line, tremors, irritated eyes, hypo-tension, insomnia, lassitude

Cadmium

LEL/UEL = NA

Cal OSHA Action Level / PEL /IDLH = 0.0025 /0.005 / 9 mg/m³

Hazard Properties = toxic

Exposure Routes = inhalation, ingestion

Target Organs = respiratory system, kidneys, prostate, blood

Acute exposure symptoms = Pulmonary edema, dyspnea (breathing difficulty), cough, chest tightness, substernal (occurring beneath the sternum) pain; headache; chills, muscle aches; nausea, vomiting, diarrhea; anosmia (loss of the sense of smell), emphysema, proteinuria, mild anemia; [potential occupational carcinogen]

Arsenic

LEL/UEL = NA

Cal OSHA Action Level / Permissible Exposure Level (PEL) = 0.005 / 0.01 mg/m³

Hazard Properties = carcinogen, slight explosion hazard in dust form, toxic

Exposure Routes = absorption, inhalation, ingestion, skin/eye contact

Target Organs = liver, kidneys, skin, lungs, lymphatic system

Acute exposure symptoms = ulceration of nasal septum, gastrointestinal disturbances, respiratory irritation, hyper-pigmentation of skin.

Methane

Methane (CH₄) is a non-toxic, highly flammable, colorless, odorless natural gas that may occur in site soil gas.

B4.2 Physical Hazards

Onsite physical hazards may include:

- Mechanical hazards related to operations associated with excavation equipment, soil handling equipment, and soil sampling equipment;
- Tripping or falling hazards around excavation equipment and open excavations;
- Noise hazards from operating or working near heavy equipment;
- Subsurface utility lines (e.g., gas, electricity, and water); and
- Hazards inherent to operating a passenger vehicle.

B5.0 HAZARD MITIGATION

B5.1 Chemical Hazards

The chemical hazards listed above will be mitigated by a combination of onsite air monitoring and having onsite personnel wear the appropriate PPE, as needed. The potential presence of VOCs in ambient air will be monitored using a portable photo-ionization detector (PID). The PID will be calibrated following instructions provided by the manufacturer. The presence of dust containing heavy metals in ambient air will be monitored using a portable particulate air monitor. Initial meter readings will be made prior to sampling in order to establish background concentrations. Sampling operations will commence and the following level of protection will be adhered to:

Level D Respiratory Protection - not required, available if necessary
 Dermal Protection - Steel-toed boots and disposable latex and vinyl gloves
 Other Equipment - hard hat, eye and ear protection

If measured average concentrations of VOCs and metals in ambient air exceed background concentrations, personnel will be required to utilize respirators with organic vapor (OV) filters and wear Tyvek suits (Level C), in addition to the PPE required for Level D.

Finally, PES will be prepared to halt operations or control emissions, if any, if it appears that any nuisance emissions are evident.

Decontamination procedures for onsite personnel during Level C conditions will follow applicable NIOSH/OSHA regulations. Decontamination procedures for Level D conditions consist of being required to wash hands with soap and potable water after performing any onsite activities and prior to ingestion of food or liquids.

Due to the presence of methane gas, appropriate measures should be taken to protect against fire or explosion potentials by using properly spark-arrested equipment and adequate ventilation for the excavation.

B5.2 Physical Hazards

The potential mechanical hazards associated with heavy equipment will be avoided by maintaining adequate clearance around operating equipment. While working at the site, the field personnel must be aware of equipment movement, general traffic, and facility operations.

Potential traffic hazards will be avoided by maintaining adequate clearance around moving equipment and vehicles and implementing safe speed practices. A traffic control subcontractor will be used to provide traffic control (e.g., lane closures, placement of no parking signs) if work is to be conducted within or adjacent to city streets.

Potential electrical hazards can be avoided by: (1) locating buried utilities in areas where subsurface work is performed; (2) making sure all equipment is properly grounded; (3) keeping equipment a safe distance away from overhead lines; (4) using ground-fault circuit breakers; and (4) taking appropriate action in the event a storm approaches (e.g., take shelter in building or vehicle; stay away from drill rig, isolated trees and standing water; stay low to ground). Underground Service Alert will be contacted a minimum of three (3) days prior to the onset of subsurface work to clear utilities.

All personnel will be required to wear eye and ear protection, a hard hat, and steel-toed boots when working.

All personnel must be aware of potential trip or fall hazards and shall exert due caution when walking in all work areas.

B6.0 EXPOSURE MONITORING

Exposure air monitoring will be conducted to measure air quality impacts at the project site to gauge the need for worker protection, need for improved dust control and provide documentation of air quality monitoring.

Based upon soil analytical data, the primary constituents of potential concerns for ambient and worker air are petroleum hydrocarbons (and related constituents) and dusts containing varying concentrations of lead, cadmium, and/or arsenic. The maximum detected residual lead concentration in the soil is 760 milligrams per kilogram (mg/kg). Cadmium was detected at a maximum concentration of 2.6 mg/kg. Other metals such as arsenic, chromium, copper, nickel, and zinc may also be present. Based on the soil concentration and the exposure criteria, lead is the most significant hazard. If the airborne lead concentration is controlled to be below exposure criteria, other contaminant exposures should be below the exposure criteria.

Air monitoring will be conducted as follows:

- A minimum of twice per field mobilization to document ambient levels (VOC/dust) in each active exclusion zone;
- Intermittently as field work proceeds, and at a frequency commensurate with all field tasks to adequately protect workers from potential chemical exposures;
- Immediately, if noticeable odors occur during field activities;
- When visible dust is observed in the exclusion zone;
- When work begins at a different location of the site;
- When a different type of operation is initiated; and

- When required by the SSO.

The following types of monitoring are selected based on known site conditions and assumptions made during the review of site contaminants. Additional types of monitoring may be needed if conditions change to evaluate whether increased protection is warranted.

B6.1 Total Organic Vapor Monitoring

Organic vapors (VOCs) could potentially become airborne and be a risk to construction workers. When contaminated soils are encountered or intrusive activities are conducted and it is the opinion of the SSO in discussions with the client, periodic monitoring of the breathing zone for Total Organic Vapors (TOV) with a PID or equivalent (e.g. organic vapor analyzer [OVA]) will be conducted. If the PID detects TOV at sustained concentrations greater than 1 ppm over background concentrations, air-purifying respirators will be worn and a colorimetric benzene detector tube will be used to measure benzene concentration. If the PID readings exceed 5 ppm sustained or 1 ppm benzene, all work will stop and the source of the contaminants identified by site personnel wearing Level C protection. Full face air purifying respirators (Protection Factor = 100 with OV/HEPA cartridges) will be worn if investigators are exposed to greater than 10 ppm. Work may not resume until airborne TOV readings are below 5 ppm. Should detector tube readings for benzene exceed 1 ppm in the breathing zone, industrial hygiene sampling will be conducted to determine employee's 8 hour exposure and appropriate control measures implemented thru cooperation of the SSO and Project Certified Industrial Hygienist (CIH).

B6.2 Airborne Particulate Monitoring

Monitoring shall be conducted on a daily basis for the duration of the soil excavation activities. Monitoring shall include real-time monitoring for dust and collection of airborne inorganic lead should anticipated dust levels exceed the action trigger based upon reported lead levels.

B6.2.1 Real-Time Air Monitoring

Real time air monitoring will be conducted in the work area (i.e. mini-Ram / *personal data* RAM or equivalent) to evaluate worker and perimeter exposure to airborne dusts.

In general the HSO or designated representative will conduct exposure monitoring at a minimum of 15 minute intervals during intrusive activities at the site. After the first two hours of real time exposure monitoring, real-time air monitoring frequency may be reduced to once per 30 minutes. Upon review of these monitoring results, the real-time air monitoring frequency may be further reduced following discussions with the project manager.

Also, dust generated from onsite activities will be visually monitored continuously. If dust is visible in normal light, if the eyes and respiratory tract become irritated, or if the nasal passages become congested, a half- or full-face respirator with HEPA (P-100) cartridges will

be worn; increased dust suppression methods increased and increased exposure monitoring will be conducted.

Air monitoring will be conducted in the workers breathing zone (of employees with greatest opportunity for exposure).

Monitoring shall be conducted on a daily basis for the duration of the potential contaminant exposure (e.g. earthwork) activities.

The mini-Ram (or equivalent) will be calibrated before commencement of each day's activities and will be operated and maintained in accordance with the manufacturers specifications. Background levels of total dust will be verified during excavation work to establish whether off site sources of dust are contributing to the readings indicated during routine exposure monitoring. Exposure monitoring data will be recorded on the "Direct Reading Instrument Log".

The action levels for total dust are identified below and the calculations used to determine the action levels are identified below. The action levels for dust have been calculated from guidance from the Department of Toxic Substances Control (DTSC).

B6.2.2 Industrial Hygiene Monitoring

In addition to real-time air monitoring, samples using traditional industrial hygiene techniques may be collected for lead and/or other airborne contaminant analysis (e.g. arsenic) as described below if airborne dust levels cannot be controlled to less than the airborne dust trigger levels. All monitoring shall be conducted by a trained and CIH and/or industrial hygiene technician under the direction of a CIH. The levels of concern for air contaminants from sample monitoring will be the Cal/OSHA PELs and Action Level for inorganic lead. The Cal/OSHA PEL and Action Level for inorganic lead are specified above.

B6.3 Initial Exposure Assessment

Initial exposure assessment will be performed to evaluate PPE requirements for onsite workers and dust control measures for protection of site workers. As noted above, if airborne dust cannot be maintained below the Airborne Dust Trigger Level, air sampling for inorganic lead will be performed within the workers breathing zone. At least one worker representing each work task who would be expected to have the highest "worst case" potential for exposure shall be selected for sampling for inorganic lead monitoring.

B6.3.1 Daily Monitoring

If analytical results from the initial exposure assessment are less than the PEL or Action Levels then a downgrade in PPE may be made upon agreement from the client, the PEI Project Manager and SSO. However, if analytical results indicate that sample concentrations are

greater than the PEL, monitoring will be continued on at least a daily basis until additional dust suppression measures are implemented and lead analytical results indicate that sample concentrations are less than the Action Level and/or PEL.

B6.3.2 Sample and Analysis

Sample Collection: Air samples will be collected with air monitoring pumps in accordance with the NIOSH Methods 7300 (lead). Procedures outlined in the NIOSH Manual of Analytical Methods for monitoring are as follows:

1. For lead sampling, the preferred collection device will be the 37-mm diameter air sampling cassette with a 0.8 micrometer mixed cellulose ester filter.
2. Sampling pumps will be calibrated before and after use with a representative sampler installed between the pump and calibration devices.
3. For personal sampling, fasten the (uncapped) cassette to the workers lapel. The inlet should be oriented downward. Other sample cassettes should be placed upwind and downwind of the work area at an elevation of 4 to 6 feet above ground surface (human breathing zone).
4. Each set of samples will include 10% field blanks for QA/QC purposes. Open the field blank cassettes and other cassettes just prior to sampling. The top covers and field blank cassettes will be stored in a clean area (i.e. closed freezer bag) during the sampling period.
5. For lead sampling, sample at 1 L/min or greater (to a maximum of 4 L/min). NIOSH regulations specify a minimum sampling volume of 50 L and a maximum sampling volume of 2,000 L.
6. After the approximate volume of sample has been collected, replace end plugs.
7. Ship samples to the analytical laboratory in a rigid container with sufficient packing material to prevent damage.

Sample Analysis: Air samples collected during this project shall be submitted to the analytical laboratory and analyzed as follows:

1. Samples will be delivered to a designated American Industrial Hygiene Association (AIHA) accredited laboratory on a shift basis so that verbal reports on air sample results can be obtained within 12 to 24 hours after collection.
2. Lead samples will be analyzed in accordance with the NIOSH Method 7300 inductive coupled ion plasma (ICP).

Other additional air monitoring may be necessary during the project as required by Cal/OSHA, by the client’s representatives and as determined by the Project Manager and SSO.

B6.4 Action Levels

B6.4.1 Calculation of Total Dust Occupational Action (Trigger Levels)

Assumptions:

1. Lead is the contaminant with the greatest concentration and potential for employee exposure on-site through dust.
2. Controlling lead exposure to less than the Action Level for lead will prevent exposure to other contaminants to below their respective Permissible Exposure Levels (PELs).
3. Maximum residual lead concentration in soil is 760 mg/kg (=0.000760 mg Pb/ mg soil).
4. *Maximum lead concentration in dust is 0.000760 mg Pb/mg.*

Calculations:

1. The allowable dust concentration in air is calculated as:
 - Allowable lead dust concentration = Allowable lead concentration in air (mg/m3)/Concentration of Pb in dust = 0.03/0.000760 = **39.47 mg/m3**
2. The trigger level for allowable dust in air is 50% of the allowable dust concentration or:
 - Trigger level lead dust concentration = Allowable lead dust concentration (mg/m3) X 50% = 39.47 mg/m3 X 0.50 = **19.73 mg/m3**

B6.4.2 Direct-Reading Instrument Action Levels for Area Monitoring

Direct reading instrument action levels are presented below:

Monitored Parameter	Action Level	Response to Action Level
<p>Particulates and dust (respirable dust) in the work area using a <i>personal data</i>-Ram portable aerosol monitor. Every 15 min. during intrusive work in contaminated site locations. May be downgraded.</p>	<ul style="list-style-type: none"> • Visible dust or • 19 mg/m³ intermittent (less than 1 minute) in the construction area for construction worker 	<p>The SSO shall:</p> <ol style="list-style-type: none"> 1. Monitor onsite airborne particulate concentrations. 2. Initiate dust suppression measures to ensure worker breathing zone concentrations are below action

a photoionization detector (PID) or flame ionization detector (FID). Initially twice per day to determine potential hazard. Frequency may be downgraded/upgraded based upon measure levels.	zone for 1 minute. > 1 ppm benzene as measured with a detector tube (operators breathing zone)	2. Identify source of airborne contamination. 3. Implement necessary controls to maintain levels to less than 5 ppm (1 ppm benzene).

B6.4.3 Employee Exposure Monitoring

If in the opinion of the Project Manager and/or SSO that employees potential to airborne contaminants may exceed specified PELs and/or Action Levels, employee exposure monitoring will be conducted as shown below and compared to applicable workplace exposure standards (i.e., PELs). Employees will be notified of exposures as required by regulations.

Employee Exposure Monitoring Requirements During Soil Disturbance Activities

Contaminant and Equipment	Collection and Analytical Methods	Frequency, Duration and Location	Calibration Schedule
VOCs Air sampling pump equipped with charcoal tube	NIOSH 1501	One sample per job task for an 8-hour period, for actual operator exposure period.	Twice daily using primary standard calibration device.
Particulate (lead, hexavalent chromium)	NIOSH 7300	At least one full shift sample of each separate task w/ exposure to lead or hexavalent chromium above PEL and / or AL (Action Level, see Title 8, California Code of Regulations, Section 1532.1 – Lead)	Follow NIOSH guidelines and OSHA requirements (OSHA Technical Manual)

B7.0 SITE CONTROL MEASURES

The PES project geologist or engineer will be in charge of onsite activities and will be responsible for site control. Communication between field team members will consist of verbal communications either directly, or through mobile phones.

B8.0 ENGINEERING CONTROLS

Concentrations of petroleum hydrocarbon constituents and heavy metals in soil indicate that dust control measures will be, at a minimum, consistent with standard construction practices. These will include, but are not limited to, the following:

- Watering of active excavation areas to prevent visible dust plumes from forming or migrating; and
- Misting or spraying while loading or transporting soil, broken concrete or other construction debris.

Subsurface activities shall immediately cease if visible dust is continually being generated beyond reasonable levels.

Additional dust measurement and dust mitigation measures to be followed during plating shop closure and site investigation activities are presented in Appendix C of the RWP.

B9.0 WORK PRACTICES

Safe work practices to be employed during the entire progress of field activities are as follows:

- Set up, assemble, and check out all equipment for integrity and proper function prior to starting work activities;
- Do not use faulty or suspect equipment; and
- Use only new and intact protective clothing.

Additional standard safe work practices are listed in the PES Injury and Illness Prevention Program, a copy of which is located at the PES corporate office.

Procedures for site work in areas where previously unknown contamination is discovered are presented in Section B10.

The Cal OSHA Safe Work Practices requirements will be posted at the jobsite (see Section B15).

B9.1 Sanitation

Temporary sanitary facilities will be established or identified at the site for the duration of the work and will be serviced at regular intervals. Workers will complete the following personal hygiene procedures before leaving the work site:

- Toilet and hand washing facilities will be located on site or an alternate sanitary facility and their specific location identified prior to beginning work activities;
- Where employees are engaging in the application of paints, coatings, or in other operations involving substances which may be harmful to the employees, cleansing facilities shall be provided in proximity of the worksite and shall be so equipped as to enable employees to remove such substances. Depending upon the problem, these facilities may be in the form of ordinary soap and water or in the form of special compounds designed specifically for removal of the harmful material from skin surfaces;
- Potable drinking water will be on site for use by site personnel;
- Personal protective equipment shall be kept clean and in good repair. Safety devices, including protective clothing worn by the employee, shall not be interchanged among the employees until properly cleaned; and
- All equipment leaving the site will be free of gross hazardous and non hazardous waste (i.e. mud and/or soil).

B9.2 Heat Stress

Heat stress conditions are not anticipated because of the location and time of year of work. The provisions of the Cal OSHA Heat Illness Prevention standard will be implemented. These include:

1. Provision of Water - Employees shall have access to potable drinking water. Water shall be provided in sufficient quantity at the beginning of the work shift to provide one quart per employee per hour for drinking for the entire shift.
2. Access to Shade - Employees suffering from heat illness or believing a preventative recovery period is needed, shall be provided access to an area with shade that is either open to the air or provided with ventilation or cooling for a period of no less than five minutes. Such access to shade shall be permitted at all times.
3. Training:
 - A. Employee Training - Training in the following topics shall be provided to all supervisory and non-supervisory employees.
 - The importance of frequent consumption of small quantities of water, up to 4 cups per hour under extreme conditions of work and heat;
 - The importance of acclimatization;

- The different types of heat illness and the common signs and symptoms of heat illness;
 - The importance of immediately reporting to the employer, directly or through the employee's supervisor, symptoms or signs of heat illness in themselves, or in co-workers;
 - The employer's procedures for responding to symptoms of possible heat illness, including how emergency medical services will be provided should they become necessary;
 - Procedures for contacting emergency medical services, and if necessary, for transporting employees to a point where they can be reached by an emergency medical service provider; and
 - How to provide clear and precise directions to the work site.
- B. Supervisor Training - Prior to assignment to supervision of employees working in the heat, training on the following topics shall be provided:
- The procedures the supervisor is to follow to implement the applicable provisions in this section; and
 - The procedures the supervisor is to follow when an employee exhibits symptoms consistent with possible heat illness, including emergency response procedures.

B9.3 Illumination

All work will be done during daytime hours. If poor light levels are identified during any activity, adequate illumination levels will be provided to provide a minimum of 20 foot-candles in any work area.

B9.4 Spill Control

Spills of soils and water will be cleaned up as soon as possible once they are observed with appropriate methods including wet methods, and/or HEPA vacuums.

Employees cleaning up debris and waste in the exclusion zone/ regulated area where respirators are required shall wear respirators which are selected, used and fitted per PES' Respiratory Protection Program Requirements.

B10.0 PROCEDURES FOR DISCOVERY OF UNKNOWN AREAS OF CONTAMINATION

Site development activities may result in the identification of previously unknown areas or types of contamination. To determine if an environmental condition is unknown, the SS and / or SSO should review all available soil and groundwater analytical reports which may provide and/or describe known types of compounds previously discovered on the site, the magnitude of the detections, and the specific locations where they were discovered. This information will guide the contractor in determining whether an encountered environmental condition is unknown and therefore will trigger contingency monitoring, as described in the succeeding paragraphs below.

Unknown conditions which may trigger contingency monitoring procedures during site development include, but are not limited to the following:

- Oily, shiny, or saturated soil or separate-phase product in previously undocumented areas;
- Soil with a significant chemical or hydrocarbon-like odor in previously undocumented areas; and
- Significantly discolored soil that reasonably indicates a concentrated source of metals within the site other than metals naturally occurring or otherwise known to be present in the Native Soils.

Upon the discovery of one of the conditions identified above, and if the conditions on the site vary materially from those previously documented such that they could require either alternative or additional measures to protect human health or additional calculations and assessments to confirm that the existing site measures will be sufficiently protective, contractor will conduct the contingency monitoring.

Contingency monitoring, if conducted, will consist of the following steps: If unknown areas of potential concentrated metals are encountered, additional analyses should be conducted for the suspected constituents to assess the potential leach-ability of the metals, or the “client” should be contacted for assistance in determining if additional sampling and potential mitigation is necessary. If the encountered materials are suspected to be volatiles, the following contingency monitoring procedures may be followed by trained site personnel (i.e. SSO) protected in at least Level B or C PPE depending upon the risk:

- i) Conduct contingency monitoring by taking organic vapor readings using an organic vapor meter (e.g. PID) or a flame ionization detector (FID) to screen for the presence of fuel, oil, or solvents. If the PID/FID indicates that an unknown area of fuel, oil, or solvents has been detected, the client and/or regulatory agency will be notified to determine if additional sampling is appropriate prior to continuing construction in that area. Such additional characterization will not be required if the client and/or

regulatory agency concurs that the current risk management measures already mitigate the risk of the chemicals detected in this area. PID/FID or equivalent screening methods will be conducted by experienced personnel only.

- ii) If an unknown area of fuel, oil or solvents has been identified, and the client and/or regulatory agency has requested additional characterization, the following steps will be taken:

Samples will be collected from the identified area and analyzed for volatiles and/or TPH compounds, depending on the suspected type of contamination. The sampling strategy will be discussed with the client and/or regulatory agency prior to the initiation of the sampling activities. Analytical results collected from the suspected source will be compared to the health based site-specific target levels (SSTLs) developed and approved for the site. If the levels are below the relevant health based SSTLs, and the client and/or regulatory agency concludes that the potential for ecological impacts is insignificant and does not require mitigation, then soil removal activities will not be required and the soil may be temporarily stored elsewhere pending reuse on the site. All soils will be contained during transport within the site so as to minimize the potential for spillage and exposure.

B11.0 TRAINING AND MEDICAL MONITORING

All PES employees have fulfilled the applicable training and medical monitoring requirements described in 40 CFR 1910.120 and T8-CCR, Section 5192. All subcontractors to PES shall provide evidence of having met the same requirements prior to performing onsite work.

In addition, all on-site workers will have received Lead Awareness training as specified in: Title 8, California Code of Regulations, Section 1532.1 (lead).

Also, immediately prior to initiating field activities, a tailgate training session shall be held to discuss this HASP and the procedures contained herein.

B15.0 CODE OF SAFE PRACTICES

(To be posted on-site)

(This is a suggested code. It is general in nature and intended as a basis for preparation by the contractor of a code that fits his operations more exactly.)

GENERAL

1. All persons shall follow these safe practice rules, render every possible aid to safe operations, and report all unsafe conditions or practices to the foreman or superintendent.
2. Foremen shall insist on employees observing and obeying every rule, regulation, and order as is necessary to the safe conduct of the work, and shall take such action as is necessary to obtain observance.
3. All employees shall be given frequent accident prevention instructions. Instructions shall be given at least every 10 working days.
4. Anyone known to be under the influence of drugs or intoxicating substances that impair the employee's ability to safely perform the assigned duties shall not be allowed on the job while in that condition.
5. Horseplay, scuffling, and other acts that tend to have an adverse influence on the safety or well-being of the employees shall be prohibited.
6. Work shall be well planned and supervised to prevent injuries in the handling of materials and in working together with equipment.
7. No one shall knowingly be permitted or required to work while the employee's ability or alertness is so impaired by fatigue, illness, or other causes that it might unnecessarily expose the employee or others to injury.
8. Employees shall not enter manholes, underground vaults, chambers, tanks, silos, or other similar places that receive little ventilation, unless it has been determined that is safe to enter.
9. Employees shall be instructed to ensure that all guards and other protective devices are in proper places and adjusted, and shall report deficiencies promptly to the foreman or superintendent.
10. Crowding or pushing when boarding or leaving any vehicle or other conveyance shall be prohibited.
11. Workers shall not handle or tamper with any electrical equipment, machinery, or air or water lines in a manner not within the scope of their duties, unless they have received instructions from their foreman.
12. All injuries shall be reported promptly to the foreman or superintendent so that arrangements can be made for medical or first aid treatment.
13. When lifting heavy objects, the large muscles of the leg instead of the smaller muscles of the back shall be used.
14. Inappropriate footwear or shoes with thin or badly worn soles shall not be worn.
15. Materials, tools, or other objects shall not be thrown from buildings or structures until proper precautions are taken to protect others from the falling objects.

APPENDIX C

DUST & ODOR MANAGEMENT PLAN

APPENDIX C

DUST AND ODOR MANAGEMENT PLAN REMEDICATION WORK PLAN PROPOSED 64th AND CHRISTIE RESIDENTIAL BUILDING EMERYVILLE, CALIFORNIA

C1.0 INTRODUCTION

PES Environmental, Inc. (PES) has prepared this dust and odor management plan for remediation activities to be conducted at the property located at the southeast corner of the intersection of 64th Street and Christie Avenue, Emeryville, California (site). As part of the remediation, excavation and off-site disposal of soil is considered to be the most appropriate remedial alternative for the site.

Redevelopment plans consist of demolition of the existing structures and construction of a single reinforced concrete and steel building. The lowest level will be a subgrade parking area with a ground level consisting of additional parking, a leasing office, residential units, and the lobby for the upper-floor residential units.

The subgrade parking level will be constructed approximately 10 feet below the existing ground surface and will be accessed by a ramp situated at the garage entrance along 64th Street. The footprint of the subgrade parking level, which encompasses the majority of the subject property, is shown in plan view and in cross-section on Plate 3 of the main text. The proposed structure is to be constructed atop the subgrade garage level and basically “float” above the existing ground surface. Narrow landscaped areas and concrete sidewalks fronting on 64th Street and Christie Avenue will be constructed at-grade.

C2.0 DUST MANAGEMENT DURING REMEDIATION ACTIVITIES

Depending upon the soil conditions, during excavation there is a potential to generate a nuisance dust condition. Water will be applied to the work area where soil is being disturbed on an as needed basis to mitigate the potential for dust generation. Dust level monitoring of air will be conducted to evaluate the potential exposure to site personnel and to offsite downwind receptors. The presence of airborne dust will be evaluated through the use of real time personal sampling equipment and perimeter air sampling. The dust standard will be based on a ceiling level of no more than 50 micrograms per cubic meter difference between upwind and downwind sampling locations. If this level is exceeded additional dust suppression activities such as water application, will be conducted in the areas of active soil excavation and handling. Information gathered will be used to verify the adequacy of the levels of protection being employed at the site, and may be used as the basis for upgrading or downgrading levels of personal protection, at the discretion of the Site Safety Officer. Dust level monitoring of air

activities is further described below and in detail in the site-specific Health and Safety Plan (HASP) prepared for the site and presented previously in Appendix B of the RWP.

Stockpile management practices discussed in the previous section will be used to control fugitive odor or dust emissions in the stockpile staging area. Trucks used for transporting affected soil will be covered to reduce the potential for fugitive dust during transport to the disposal facility. Street sweeping will be used to remove soil/dust from public roadways as required. Swept material will be added to the soil stockpile for subsequent disposal off the site.

C3.0 ODOR MANAGEMENT DURING REMEDIATION ACTIVITIES

Although the proposed remedial action is not a soil aeration process, some volatilization of lighter-fraction organic compounds (i.e., total petroleum hydrocarbons quantified as gasoline [TPHg] and petroleum hydrocarbon constituents [benzene, toluene, ethylbenzene, and total xylenes]) may occur during excavation and soil management activities associated with the petroleum hydrocarbon-affected soils, if encountered.

In addition, applicable guidelines and notification requirements set by the Bay Area Air Quality Management District (BAAQMD) in Regulation 8, Rule 40 of the BAAQMD Rules and Regulations for aeration of contaminated soil will apply to the removal action. Notification will be provided to BAAQMD as required.

C4.0 DUST AND ODOR MONITORING

To the extent feasible, the presence of airborne contaminants will be evaluated through the use of portable monitoring equipment. Information gathered will be used to ensure the adequacy of the levels of protection being employed at the site, and may be used as the basis for upgrading or downgrading levels of personal protection, at the discretion of the Site Safety Officer. Details of the air monitoring program are provided in the project Health and Safety Plan (HASP).

The following air sampling equipment will/may be utilized for dust and odor monitoring:

- Photo-Ionization Detector (PID); and
- Dust monitor (MiniRAM, Dataram, or similar).

The PID will serve as the primary instrument for personal exposure monitoring during excavation. The instrument will need to be utilized to fully characterize potential employee exposure and the need for equipment upgrades/downgrades. Air monitoring will be conducted in accordance with the requirements set forth in the HASP.

Dust monitoring will be conducted to characterize the potential for exposure to site personnel during soil disruption operations using a direct-reading dust monitor. In addition, perimeter or “fence line” monitoring will be performed at a location(s) downwind of site operations on a periodic basis. Continuous monitoring should be performed during operations that have not been characterized. After initial site screening, monitoring shall be conducted periodically (i.e., every 30 minutes) or anytime site conditions might be altered (i.e., weather, drilling, excavation, spills, etc.).

Integrated Industrial Hygiene (IH) sampling for lead will be conducted during the excavation process and/or loading operation. Lead was selected on the basis of its detection in site soil above the Regional Water Quality Control Board, San Francisco Bay Region (RWQCB) direct exposure soil screening level (ESL) for commercial/industrial workers of 88 milligrams per kilogram (mg/kg) for lead in soil. This IH sampling will be performed to properly characterize potential employee exposures and/or to establish baseline levels. Sampling may include personnel monitoring and fence line sampling. The duration of such monitoring will be determined based upon analytical results, regulatory requirements, etc.

Results of monitoring information shall be recorded, and will include time, date, location operations, and any other conditions that may contribute to potential exposures. All maintenance and calibration information shall be maintained and made available upon request. The monitoring equipment will be calibrated in accordance with the manufacturer’s specifications, and the records of such maintained with the project health and safety plan.

C5.0 DUST MEASUREMENT AND MITIGATION PROCEDURES

C5.1 Dust Control

A MiniRAM dust meter (PDM-3 or equivalent) will be used to measure real-time dust levels. Action levels will be based on the site-specific Health and Safety Plan. If dust levels exceed the specified action level for one minute or more in the worker breathing zone, then work should be stopped and mitigation measures undertaken before work resumes.

C5.2 Worker Protection

Worker protection will be conducted according to the site-specific Health and Safety Plan. Worker protection will use respirators, real-time monitors, rotation of crews in work areas, and/or mitigation of dust as necessary to meet the health and safety requirements.

C5.3 Dust Mitigation Measures

Dust mitigation measures will be specified based on the results of the dust monitoring. The best (most reasonable) available control measures will be used to minimize dust emissions. The preferred method of dust control at this site is spraying water over the dust source(s) periodically to keep the exposed surface moist. Plastic sheets will be used to cover stockpiled

soil and construction debris as well as other exposed areas. If the wind speed rises to greater than 15 miles per hour (mph), operations will cease.

Control measures for fugitive dust include, but are not limited to, the following procedures:

- Dust monitoring
- Watering the area of demolition and/or excavation at least twice daily
- Covering construction debris and/or soil stock piles with plastic tarps or equivalent
- Ceasing operation during high wind (greater than 15 mph)
- Sufficiently watering and/or securely covering material transported offsite
- Minimizing the area that requires excavation and earth moving operation
- Impose site speed limits for all vehicles to less than 5 miles per hour
- Minimizing the drop height of soil from the excavator bucket to the haul truck bed.

Prior to departure to the surface streets surrounding the site, the waste-hauling trucks will be checked for material residue and rinsed down in the contaminant reduction zone. Following exit of trucks bearing excavated material, the public paved roadways surrounding the site will be checked for any material possibly tracked out, despite mitigation efforts. The roadways will be cleaned of this material within an hour of observation.

C6.0 ADDITIONAL DUST CONTROL PROCEDURES

The information discussed below was provided by the California Environmental Protection Agency, Air Resources Board.

“Ways to Control Naturally Occurring Asbestos Dust”

Note: Although this document addresses naturally occurring asbestos, similar control techniques are appropriate for other dusts (i.e. nuisance dusts).

PES will designate a person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site and to implement methods for mud control on pavement. Their duties will include holiday and weekend periods when work may not be in progress.

In addition to the above, the following information is provided to serve as a tool for the SSO / Competent Person in identifying and evaluating dust control methods. Any and/or all methods will be used to accomplish the goal of maximum dust control.

Fact Sheet #3

Ways to Control Naturally-Occurring Asbestos Dust

- Shown below are ways to control asbestos dust from construction projects and roadways. These control actions will not eliminate asbestos, but offer options to reduce release of airborne asbestos fibers from various activities.

Construction Projects and Roadways

Dust Source	Mitigation Measure	Application Frequency	Relative Effectiveness¹
Excavation	Water wetting	as needed	2-3
	Excavate during calm periods	when possible	1
Mobile Construction Equipment	Water wetting of roads surfaces	as needed	2-3
	Rinse vehicles / equipment	as needed	3
	Wet loads of excavated material	each load	3
	Cover loads of excavated material	each load	2-3
	Wet and cover loads	each load	4
Exposed Ultramafic or Serpentine Areas	Water wetting	as needed	3-4
	Cover with 6 to 12 inches of non-asbestos material	end of project	4
	Wind breaks / berms	where needed	1-2
	Chemical sealants / dust suppressants	3 mos. - 1 yr.	3
	Vegetative reclamation	end of project	3
	Asphalt cement paving	as needed	4

Roads	Water wetting	as needed	3-4
	Speed control	always	1-3
	Wind breaks / berms	where needed	1-2
	Cover with 2 to 4 inches of non-asbestos rock	as needed	3-4
	Chemical sealants / dust suppressants	3 mos. - 1 yr.	2-3
	Single-coat chip/seal	as needed	4
	Triple-coat chip/seal	as needed	4
	Petroleum sealants	as needed	4
	Asphalt cement paving	as needed	4

1. Subjective rating where: 1 = least effective, and 4 = most effective

APPENDIX D

WASTE TRANSPORTATION PLAN

APPENDIX D

WASTE TRANSPORTATION PLAN REMEDATION WORK PLAN PROPOSED 64th AND CHRISTIE RESIDENTIAL BUILDING 6340 AND 6390 CHRISTIE AVENUE EMERYVILLE, CALIFORNIA

D1.0 INTRODUCTION

PES Environmental, Inc. (PES) has prepared this waste transportation plan for remediation activities proposed for the properties located at 6340 and 6390 Christie Avenue (the site), Emeryville, California. As part of the remediation, excavation and off-site disposal of soil is considered to be the most appropriate remedial alternative for the site. This document provides information related to the off-haul and off-site disposal of the excavated soils.

D2.0 WASTE GENERATION

Based on the results of previous environmental investigations, soil at the site includes varying concentrations of petroleum hydrocarbons, petroleum hydrocarbon constituents, and/or metals. Design plans for the building include subgrade parking beneath the building footprint. Based on an approximated range depths of 11 to 15 feet for the lower garage excavation, between 19,800 to 26,900 cubic yards (roughly 30,000 to 40,000 tons) of soil will be excavated from the site for building construction purposes. The total amount of soil proposed for excavation is estimated to result in approximately 1,700 to 2,200 truck trips leaving the subject property for disposal of affected soil at approved facilities, assuming a truck load capacity of approximately 18 tons. Further characterization of soil quality will be conducted prior to implementation of the excavation activities to aid in waste characterization and off-site disposal. Waste characterized as Class 1 materials will likely be sent to the Class 1 disposal facility in Kettleman Hills, California. Waste characterized as Class 2 materials will likely be sent to a Class 2 disposal facility in Contra Costa County, California

D2.1 Truck Loading and Preparation for Off-Haul

Following waste characterization and acceptance of the excavated soil at an appropriate disposal facility (distinct facilities may be required based on the waste characterization results), the affected soil will be loaded in licensed haul trucks (end-dumps or transfers) and transported off the site following appropriate California and federal waste manifesting procedures. The appropriate waste manifest documentation will be provided to the truck driver hauling the affected soil offsite.

As each truck is filled, an inspection will be made to verify that the solid waste and soil is securely covered and that the tires of the haul trucks are reasonably free of accumulated soil prior to leaving the site. Soil residue on the excavator tracks/tires and truck tires will be removed using a combination of wet and dry methods. During dry conditions, soil residues will be removed by dry brushing with a stiff-bristled broom and/or wire brush. Soil that cannot be removed by this procedure will be removed from equipment by washing with high-pressure hot water in a prepared decontamination area. During wet conditions, high-pressure hot water washing will be used in a prepared decontamination area to remove material residues and mud from the tracks and tires of equipment. Water generated during decontamination activities will be contained for analysis and appropriate disposal/recycling.

The work areas will be kept clean and free of excessive soil or debris. A street sweeper will be made available, as needed, to keep the loading area and haul roads clean. The soils will be wetted, as necessary, to reduce the potential for dust generation during loading and transportation activities. To verify that trucks are loaded within appropriate weight limits, the weight of initial trucks will be verified using either portable scales onsite or nearby stationary scales.

D2.2 Haul Routes

Once the filled trucks have been deemed suitable for leaving the subject property, the trucks will proceed through security fencing and approach Christie Avenue. If necessary, a flagman will be provided to insure safe entrance from the subject property onto the public right-of-way.

All wastes will be hauled to off-site disposal facilities via surface streets to the closest suitable freeway on-ramp. All truck traffic travelling along this surface street route will pass through commercial and light industrial areas only. No residential areas will be entered. A map of the surface street route from the site to the freeway is provided below. Once on the freeway, the exact truck route will be dependent on the location of the disposal facility that accepts the soil for disposal.

Hauls routes from the City of Emeryville to the selected landfill sites will be determined once appropriate facilities have been identified for the excavated soil. This waste transportation plan will be updated at that time and provided to the City of Emeryville for review and approval.

APPENDIX E

RESPONSIVENESS SUMMARY

**CITY OF EMERYVILLE REDEVELOPMENT
AGENCY**
1333 PARK AVENUE, EMERYVILLE, CA 94608

Cleanup Activity Fact Sheet

Proposed 64th and Christie Residential Building
6340 and 6390 Christie Avenue
Emeryville, California

December 2010

INTRODUCTION

This fact sheet has been prepared to provide information pertaining to environmental remediation activities to be conducted at 6340 and 6390 Christie Avenue (the Site) in conjunction with redevelopment of the properties by constructing a new mixed-use residential/commercial building. This fact sheet summarizes Site environmental information contained in project documents and is intended to facilitate community awareness.

LOCATION AND SITE HISTORY

The Site is located near the southeast corner of Christie Avenue and 64th Street (Figures 1 and 2). The Site is comprised of two parcels, and includes a southern parcel (6340 Christie Avenue) and a northern parcel (6390 Christie Avenue). Currently, onsite structures include a vacant 12,000 square-foot commercial building on the northern parcel, and a vacant 14,400 square foot commercial building on the southern parcel.

The Site is located in a former industrial area of Emeryville which has been undergoing redevelopment for residential and commercial purposes since the mid-1980s. The land was historically tidal mud flats and was reclaimed from the San Francisco Bay with imported soils sometime between the late 1930s and early 1940s. The existing buildings, believed to be the original construction on the Site, were built in 1966.

PLANNED PROJECT

Redevelopment plans consist of demolishing the existing structures and construction of a new five-story building, consisting of commercial office and residential uses over ventilated parking levels.

This project will be funded in part through the State of California's CALReUSE Remediation Program.

The Emeryville Redevelopment Agency is acting as the Lead Agency, in accordance with a Memorandum of Understanding with the California Department of Toxic Substances Control (DTSC).

SITE INVESTIGATION

Several environmental investigations have been conducted at the Site between 1988 and 2005. A summary of prior environmental investigations is presented in the *Draft Remediation Work Plan, Proposed 64th and Christie Residential Building, 6340 and 6390 Christie Avenue* (RWP) dated November 8, 2010 (see information below for document availability). The RWP indicates that soil and groundwater affected with petroleum hydrocarbons is present, and that soil affected by lead may also be present.

It is anticipated that soil excavation will be performed concurrent with construction of below-grade portions of the proposed building. As described in the RWP, pre-excavation testing will be conducted to assess identified and suspected contaminants at the Site and to address identified data gaps. The investigation will include: (1) soil sampling to further evaluate the extent and nature of affected soil at the Site and for pre-excavation waste characterization purposes; and (2) installation and sampling of groundwater monitoring wells across the Site to evaluate shallow groundwater quality, depth, and flow direction.

PROPOSED SITE CLEANUP

One purpose of the cleanup is the removal of affected soil so as to ensure the safety of future residents and site workers. Excavation of the affected soil will also remove potential onsite sources of contamination to groundwater. The planned cleanup activities include excavation, transportation, and disposal of soil to off-site permitted disposal facilities.

The RWP provides the following plans that describe the procedures required to implement the cleanup and to provide guidance for health and safety measures to be employed during cleanup to protect the public and the environment:

- The Waste Transportation Plan specifies procedures for loading and transporting excavated soil, procedures for truck and loading area decontamination, and haul routes that transportation vehicles will utilize to arrive at and depart from the construction site;
- The Dust and Odor Management Plan specifies procedures to limit generation of dust and monitor dust and odors during Site grading activities; and

- The Storm Water Pollution Prevention Plan specifies monitoring and mitigation of potential surface stormwater impacts during redevelopment.

The estimated duration for excavation and cleanup is approximately 60 days.

PUBLIC REVIEW OF THE RWP

A 30-day public review period for the RWP is scheduled to begin on Wednesday, December 29, 2010. A public meeting to present an overview of the RWP and to receive comments will be held on Wednesday, January 19, 2011 at 7:30 p.m. at Emeryville City Hall, 1333 Park Avenue, Emeryville, CA. Comments on the RWP should be submitted in writing (email preferred) to the Agency's project manager identified below before the close of the public comment period at 5:00 p.m. on Monday, January 31, 2011.

NOTICE OF PUBLIC MEETING REMIEDIATION WORK PLAN

6340 and 6390 Christie
Avenue, Emeryville, CA
Wednesday,
January 19, 2011

NOTICE IS HEREBY GIVEN that a public meeting will be held on Wednesday, January 19, 2011, commencing at 7:30 p.m. at the Emeryville City Hall, 1333 Park Avenue, Emeryville, California to hear comments on the Conditional Approval and Remediation Work Plan for the proposed environmental remediation activities at 6340 and 6390 Christie Avenue, located at the corner of 64th Street and Christie Avenue, in Emeryville.

Copies of the Fact Sheet, Conditional Approval, and Remediation Work Plan are available for review at the City Clerk, City Administrative Offices, 1333 Park Avenue and on the City's webpage at <http://www.ci.emeryville.ca.us/> under the "News & Events" section.

ALL INTERESTED PARTIES are invited to attend the above public meeting and express opinions or submit comments relative to the Remediation Work Plan and proposed remedial action. Written comments should be received by 5:00 p.m. Monday, January 31, 2011 and sent to the City of Emeryville, Attn. Markus Niebanck, 1333 Park Avenue, Emeryville, CA 94608; phone number (510)-596-4356; fax number (510)-596-4389; email mniebanck@ci.emeryville.ca.us.

**Responsiveness Summary
Final Remediation Work Plan
Proposed 64th and Christie Residential Building
Emeryville, CA**

This Responsiveness Summary is for the draft Remediation Work Plan (PES, December 27, 2010) for the proposed residential building to be located at the intersection of 64th Street and Christie Avenue. The Public Meeting was held on January 19, 2011 at the City of Emeryville offices and the sign-in sheet is in the City's project file. One member of the public attended the meeting, Mr. Niko Douchis. The public comment period ended January 31, 2011 and no written comments were received. The questions and answers about the remediation that were discussed at the Public Meeting are grouped into similar topics and summarized below.

1. When will demolition begin?

The demolition will likely begin during the first or second quarter of 2011 and the project will take about 18 months.

2. Do you know what was under the buildings; were there any tanks?

There are no known current tanks beneath the property; however, there was a gasoline tank on the southeast corner that was removed approximately 23 years ago. Remaining petroleum and other constituents in soil will be cleaned up by excavating most of the soil at the site to approximately 11 to 15 feet deep. Approximately 20,000 cubic yards of soil will be removed to accommodate the underground parking as part of the redevelopment of the property.

3. Do you update the Remediation Work Plan on a regular basis?

The Remediation Work Plan will be finalized after the public comment period. No changes are anticipated at this time. Changes may be made after additional investigation is conducted if new information is revealed. Changes may also occur by the contractor after the contractor is selected.
