Subject: Quarterly Ground-Water Monitoring Report for
the Period from January 1 through March 31, 1993
5050 Coliseum Way and 750-50th Avenue
Oakland, California

Dear Mr. Chan:

On behalf of Volvo GM, and in accordance with our work plan dated January 6, 1993, and submitted to the Alameda County Health Care Services Agency (ACHCSA), we have prepared this quarterly monitoring report presenting results of recent ground-water sampling and analysis conducted at the properties located at 5050 Coliseum Way and 750-50th Avenue (collectively referenced as "the Site"; Figure 1).

Levine-Fricke collected water-level measurements and ground-water samples from 11 on-site wells on March 4 and 5, 1993. Ground-water samples were submitted to a state-certified analytical laboratory for analysis of CAM Title 22 metals.

If you have any questions or comments concerning the results presented in this report, please do not hesitate to contact me or Jenifer Beatty.

Sincerely,

Kathleen A. Isaacson, R.G.
Senior Hydrogeologist

QUARTERLY GROUND-WATER MONITORING REPORT FOR THE PERIOD FROM JANUARY 1 THROUGH MARCH 31, 1993 5050 COLISEUM WAY AND 750-50TH AVENUE OAKLAND, CALIFORNIA

1.0 INTRODUCTION

This report presents results of quarterly ground-water monitoring activities conducted during the period from January 1 through March 31, 1993, for the properties located at 5050 Coliseum Way and 750-50th Avenue (collectively referenced as "the Site"; Figure 1). This report was prepared on behalf of Volvo GM Heavy Truck Corporation (Volvo GM) in accordance with our work plan dated January 6, 1993, and submitted to the Alameda County Health Care Services Agency (ACHCSA). This report includes graphic illustrations of potentiometric head (water-level) data and presents historical summaries of ground-water elevation and ground-water quality data collected at the Site.

2.0 PREVIOUS INVESTIGATIONS CONDUCTED BY LEVINE·FRICKE

Levine·Fricke conducted soil and ground-water investigations for the Site on behalf of Volvo GM in response to a letter from the ACHCSA dated April 10, 1991. The letter requested a soil and ground-water investigation in the vicinity of the waste-oil tank to further assess the extent of oil and grease (O&G) and metals, and to assess the potential impact of previous activities conducted at the Site on soil and ground-water quality.

Results of the investigations indicated elevated concentrations of metals in soil and ground-water samples collected in portions of the Site. In general, elevated concentrations of metals in soils appear to be restricted to the upper 10 feet of material beneath the Site, except in the vicinity of well LF-1, where concentrations of zinc up to 16,000 parts per million (ppm) were detected to a depth of 20 feet below ground surface (bgs). Elevated concentrations of metals were detected in ground-water samples collected from several of the wells (Levine·Fricke 1992a).

Analytical results for semivolatile organic compounds, O&G, and hydrocarbons indicate that ground water in the vicinity of well LF-1, located approximately 50 feet downgradient from the

LEVINE-FRICKE

former waste-oil tank pit, has not been affected by these compounds (Levine-Fricke 1992b).

To monitor the concentrations of metals in shallow ground-water beneath the property, a quarterly monitoring program has been implemented at the Site. The following sections describe monitoring activities conducted at the Site in March 1993.

3.0 GROUND-WATER ELEVATIONS AND FLOW DIRECTION

The top of each well casing at the Site was surveyed relative to mean sea level by a state-licensed land surveyor in November 1991. Before sampling on March 4, 1993, water-level measurements were collected from all wells at the Site. Depth to water was measured using an electric water-level sounding probe to the nearest 0.01 foot, relative to the top of the well casing. Ground-water elevation contours for shallow ground water at the Site are presented in Figure 2. A historical summary of ground-water elevations for the Site is presented in Table 1.

Depth-to-water measurements collected at the Site in March 1993 indicate that ground-water elevations have increased relative to October 1992, apparently in response to recent rain. Ground-water elevation increases ranged from 0.75 foot in well LF-1 to 4.01 feet in well MW-1.

The general ground-water flow direction for the Site in March 1993 was toward the west. As indicated on Figure 2, ground-water elevation contours indicate apparent "mounding" of ground water in the vicinity of well MW-1, with ground-water generally flowing radially away from this well.

4.0 GROUND-WATER QUALITY

Ground-water samples were collected from 11 monitoring wells on March 4 and 5, 1993.

4.1 Sampling Procedures

Before ground-water samples were collected, approximately 3 to 5 well casing volumes of water were removed from each well using a Teflon bailer. Specific conductance, pH, and temperature of the purged water were measured during this purging process to aid in evaluating overall ground-water quality. These parameters were recorded in the field on

LEVINE-FRICKE

water-quality sampling forms. Copies of these forms are included in Appendix A. Ground-water samples were collected after these parameters stabilized to within 15 percent of the previous measurement.

Ground-water samples were collected using the same Teflon bailer used to purge the well. Ground-water samples for metals analysis were filtered in the field and preserved with nitric acid. Samples were placed in an ice-chilled cooler immediately after collection for transportation to the analytical laboratory.

Samples were submitted to American Environmental Network, Inc. (formerly Quanteq Laboratories) of Pleasant Hill, California, a state-certified laboratory, for analysis of Title 22 metals. The pH values for ground-water samples collected from each monitoring well were measured and recorded in the field during sampling activities.

For quality assurance/quality control measures, a duplicate sample and a field blank were collected for well LF-1. The duplicate sample was submitted for Title 22 metals analysis and the field blank was submitted to the laboratory on a hold basis, pending analytical results.

4.2 Ground-Water Quality Results

Analytical results for metals analysis are presented on Figure 3 and in Table 2. Laboratory certificates are contained in Appendix B. Analytical results for ground-water samples collected during the recent round of sampling generally were consistent with analytical results reported previously for the Site, except for those samples collected from wells MW-2 and MW-3.

No chromium, lead, mercury, selenium, or thallium was detected in ground-water samples collected from the Site. Concentrations of 0.5 ppm or less of antimony, barium, beryllium, copper, molybdenum, silver, and vanadium were detected in samples collected from various wells on the Site.

Nickel and zinc were detected in all of the 11 wells sampled at concentrations ranging from 0.02 ppm to 11.0 ppm and 0.01 ppm to 14,000 ppm, respectively. The highest concentrations of nickel and zinc, as well as of arsenic (4.9 ppm), cadmium (44.0 ppm), and cobalt (3.9 ppm), were detected in ground-water samples collected from well LF-1.

LEVINE·FRICKE

Analytical results indicate that during the period from October 1992 to March 1993, the concentration of zinc decreased from 6,000 ppm to 290 ppm in well MW-2, and increased from 730 ppm to 3,000 ppm in well MW-3. Labeling errors in the field or laboratory may account for the anomalous data reported for wells MW-2 and MW-3, although neither field nor laboratory documentation supports this idea. Concentrations of metals detected in these wells will be monitored closely during future monitoring events to determine if there was a labeling error.

Measurements of ground-water pH were consistent with values previously reported for the Site and indicate that pH values for shallow ground water beneath the Site are variable. Low values of pH (6.4 or less) were measured for ground-water samples collected from eight wells. The pH values recorded for the remaining three wells ranged from 6.5 to 6.9 (Figure 3).

5.0 PROJECT ACTIVITIES TO BE CONDUCTED DURING THE PERIOD FROM APRIL 1 THROUGH JUNE 30, 1993

The following activities will be conducted during the period from April 1 through June 30, 1993:

- Water-level measurements will be collected from all on-site monitoring wells on a monthly basis.
- Ground-water samples will be collected from all monitoring wells in accordance to our work plan dated January 6, 1993.
- Ground-water samples will be submitted to American Environmental Network, Inc., of Pleasant Hill, California, for analysis of Title 22 metals.

PROJ. NAME: VOLVO GM

REPORT DATE: 03/18/93
DATE SAMPLED: 03/04-05/93
DATE RECEIVED: 03/05/93
QUANTEQ JOB NO: 9303045

PROJECT SUMMARY:

On March 5, 1993, this laboratory received thirteen (13) water samples.

Client requested twelve (12) samples be analyzed for CCR 17 Metals. One (1) sample was placed on hold. Sample identification, methodologies, results and dates analyzed are summarized on the following pages.

Analysis of samples LF-3, LF-7, LF-5, MW-2, MW-3, LF-1 and LF-101 (9303045-03A, 04A, 06A, 09A, 10A, 11A and 12A) have elevated reporting limits due to matrix interference. Zinc was analyzed by EPA Method 7950, Atomic Absorption Spectroscopy for all samples except LF-2 (9303045-01A) due to a malfunction of the ICP.

All laboratory quality control parameters were found to be within established limits. Batch QC data is included at the end of this report.

If you have any questions, please contact Client Services at (510) 930-9090.
