Subject: Annual Evaluation and Fourth Quarter 2001 Groundwater Monitoring Report at 5050, 5051, and 5200 Coliseum Way and 750-50<sup>th</sup> Avenue, Oakland, California.  
SLIC No. 01S0422 (BG)

Dear Ms. Graham:

Enclosed please find Clayton Group Services, Inc.'s (Clayton's) *Annual Evaluation and Fourth Quarter 2001 Groundwater Monitoring Report at 5050, 5051, and 5200 Coliseum Way and 750-50<sup>th</sup> Avenue, Oakland, California*. This report presents the results of Clayton's quarterly monitoring conducted in December 2001 and a review of the historical data at the subject property.

Clayton, under penalty of perjury as an authorized representative of Oakland 5051, LLC, presents this report as true and correct to the best of our knowledge. If you have any questions or comments, please call me at (925) 426-2686.

Sincerely,

A handwritten signature in black ink, appearing to read "Dwight R. Hoenig".

## 1.0 INTRODUCTION

Clayton Group Services, Inc. (Clayton), performed quarterly groundwater monitoring activities at the Coliseum Way Properties located at 5050, 5051, and 5200 Coliseum Way and 750-50<sup>th</sup> Avenue in Oakland, California (Figure 1 and Figure 2). The California Regional Water Quality Control Board - San Francisco Bay region (RWQCB), has requested that groundwater monitoring be performed at the subject properties to monitor the fate of petroleum hydrocarbons and metal ions. This report also includes an annual evaluation of results.

The quarterly monitoring and sampling schedule employed is presented in Table 1. The fourth quarter 2001 monitoring event included collecting depth to water measurements for 22 groundwater-monitoring wells and groundwater samples from 12 wells. Field measurements and groundwater monitoring well sampling were carried out on December 5 and 6, 2001. This report presents groundwater measurements recorded in the field and the results of laboratory analyses performed on groundwater samples collected for the fourth quarter 2001 monitoring event.

## 2.0 SITE SETTING

The 5050 and 5200 properties are located about 600 feet east of Interstate 880 and the 5051 property is located about 75 feet east of Interstate 880, in Oakland, California. The properties are bordered by stormwater drainage channels that flow into the San Leandro Bay, located approximately one-half mile to the west (Figure 1). The 5050 and 5200 properties encompass approximately 10 acres and the 5051 property is approximately 4.4 acres of relatively flat ground approximately 7 to 15 feet above mean sea level (amsl). Regionally, groundwater flows from the Oakland Hills west towards San Leandro Bay.

The subject properties and surrounding area have a long history of industrial usage. The 5050 property (which also includes the 750-50<sup>th</sup> Avenue property) is the location of former lead smelting operations (1879-1903), acids manufacturing (1903-1917), various chemical operations (1917-1926), lithopone manufacturing (1926-1963), vacant or razed property (1963-1974), and truck maintenance operations (1974 to the present). The 5051 property and the mini-storage facility at 5200 property were also part of the former lithopone manufacturing facility.

Tidally-influenced stormwater drainage channels border each of the subject properties (Figure 2). An open and unlined channel parallels the southeast property boundary of the 5051 and 5200 properties. Two subsurface culverts, the Courtland Creek Culvert and the Second Line G Culvert, parallel the northwest property boundaries of the 5050 property and the 750-50<sup>th</sup> Avenue property. The two culverts merge into an open concrete-lined channel south of the intersection of Coliseum Way and 50<sup>th</sup> Avenue. The drainage channel is open and concrete-lined along the northwestern perimeter of the 5051 property, and is open and unlined along the southwestern perimeter of the property, prior to flowing under Interstate 880.

Construction of the groundwater diversion barrier, or groundwater barrier wall, was completed between October 30 and November 1, 2001, as a remedial action for the 5051 property as outlined in the site cleanup requirements (Task 4 of Board Order No. 01-032, March 21, 2001). The groundwater barrier wall (350 feet in length) was constructed of interlocking sheetpiles along the west property boundary (Figure 2) to a total depth of between 15 and 20 feet below ground surface (bgs) to provide a barrier for groundwater that contains elevated concentrations of soluble metals from flowing into the surface water channel that borders this portion of the subject property.

### **3.0 FIELD ACTIVITIES**

The following discussion outlines field activities used to obtain depth to water measurements, monitoring well samples, and other field data. Groundwater samples were collected from 12 monitoring wells (CW-1, CW-2, CW-6, CW-7, CW-12, CW-13, LF-5, LF-11, LF-12, MWA-1, MW-4, and MW-5).

#### **3.1. DEPTH TO WATER MEASUREMENTS**

Depth to water measurements were obtained from the 22 wells selected for monitoring of the Coliseum Way Properties on December 5, 2001 prior to well purging and sampling activities. The accessible wells were opened and allowed to stabilize prior to measuring the depth to water. Measurements were obtained in a timely manner in order to minimize tidal effects. The depth to water in each monitoring well was measured with a water level indicator meter from the top of the monitoring well casing to the free water surface. The depth to water measurement was used to determine the groundwater elevation at each monitoring well location, and also to determine the groundwater purge volume for each monitoring well. The depth to water measurements were recorded onto groundwater sampling data sheets and were used to calculate the groundwater elevations presented in Table 1.

#### **3.2. MONITORING WELL SAMPLES**

The monitoring wells selected for sampling were purged of approximately four well casing volumes of groundwater until the water quality parameters had stabilized. A low flow pump was used to purge groundwater from each well. During purging, the groundwater quality was monitored in the field for the following parameters: temperature, salinity, dissolved oxygen, oxygen reducing potential, specific conductance, pH and turbidity. The water quality parameters were recorded on groundwater sampling data sheets. After purging, a new disposable bailer was used to collect a groundwater sample from each select monitoring well. Groundwater samples were collected in appropriate laboratory-supplied containers. The containers were sealed, labeled with identifying information, entered onto a formal chain-of-custody document, and placed in a chilled ice-chest for transportation to the laboratory.

#### 4.0 LABORATORY ANALYSES

Groundwater samples were collected from 12 monitoring wells and submitted to Curtis & Tompkins, Ltd. Analytical Laboratory located in Berkeley, California, a State of California certified laboratory, for analyses. The groundwater samples were analyzed by the following United States Environmental Protection Agency (USEPA) methods:

- EPA Methods 6010 and 7470 for California Assessment Manual (CAM-17) Total Metals, Laboratory Filtered and Preserved
- EPA Methods 160.1 for Total Dissolved Solids (TDS)
- EPA Method 8015 modified for Total Petroleum Hydrocarbons as Gasoline (TPH-G) MW-4, MWA-1, CW-2, CW-6, and CW-7 only.
- EPA Method 8015 modified for Total Petroleum Hydrocarbons as Diesel (TPH-D) and Motor Oil (TPH-O) for LF-11, MWA-1, CW-2, CW-6, and CW-7 only. EPA
- Method 8020 for Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX) for MW-4, MWA-1, CW-2, CW-6, and CW-7 only.

#### 5.0 SITE HYDROLOGY

The groundwater elevation at each monitoring well location was determined by subtracting the depth to water measured in each monitoring well from its surveyed top of casing elevation. The groundwater elevations in the 5050, 5051 and 5200 Coliseum Way monitoring well network ranged from a low of 1.24 feet below msl (-1.24 feet) in monitoring well CW-9 to a high of 6.16 feet above msl (6.79 feet) in monitoring well CW-4, with the exception of well MWA-3 (recorded groundwater elevation of 8.43 amsl). The groundwater elevation in this well was not typical of elevations encountered over the past six years; therefore, this elevation was considered to be anomalous and was not used in contouring groundwater at the subject property.

The general property groundwater flow direction is to the west at a hydraulic gradient of 0.010 feet per foot (ft/ft) as measured between wells LF-11 and LF-12. The average groundwater elevation was approximately 0.70 feet higher (excluding well MWA-3) than the average elevation recorded on August 30, 2001. The subject property groundwater flow direction has flow components to the southwest and south at the 5051 and 5200 properties, which is apparently a result of the surrounding ditches.

A summary of current and historic depth to groundwater and groundwater elevation data for the monitoring well network at the subject properties is presented in Table 2. A potentiometric surface map was prepared from the December 6, 2001 groundwater elevation data and is presented as Figure 2.

## 6.0 GROUNDWATER ANALYTICAL RESULTS

The sampling schedule and analytical program for this monitoring event is presented in Table 1. The following discussion presents a summary of the laboratory analytical results.

### 6.1. PETROLEUM HYDROCARBONS

Six groundwater samples were submitted for petroleum hydrocarbon analyses (CW-2, CW-6, CW-7, LF-11, MWA-1, and MW-4). TPH-G results were below the laboratory-reporting limit of 0.05 milligrams per liter (mg/L) for two samples (MW-4 and CW-6) of the five samples analyzed. Detectable TPH-G was reported in MWA-1 at 0.70 mg/L, CW-2 at 0.071 mg/L, and CW-7 at 0.065 mg/L. Detectable total BTEX was reported in all five samples analyzed, ranging from a low of 0.00062 mg/L (MWA-1) to a high of 20.43 mg/L (CW-2). Benzene was reported in only three samples, MW-4 at 0.001 mg/L, CW-2 at 0.0038 mg/L, and CW-6 at 0.00073 mg/L. Only samples MW-4 and CW-2 had benzene concentrations that meet or exceed the maximum contaminant level established for drinking water of 0.001 mg/L. No TPH-D/O concentrations were detected in any of the five samples analyzed. A summary of petroleum hydrocarbons detected in groundwater is presented in Table 3.

### 6.2. METALS

Twelve groundwater samples were submitted for metals analyses. Fourteen of the seventeen CAM 17 metal analytes were detected above laboratory reporting limits during this monitoring event. Antimony, silver, and vanadium were the only metals not detected in one or more samples. The highest concentration and corresponding monitoring well location for each detected metal ion are listed below:

Arsenic	to 2.8 mg/L	(CW-2)
Barium	to 410 mg/L	(CW-6)
Beryllium	to 0.050 mg/L	(LF-11)
Cadmium	to 79 mg/L	(LF-11)
Chromium	to 0.021 mg/L	(LF-11)
Cobalt	to 3.1 mg/L	(LF-11)
Copper	to 3.4 mg/L	(LF-11)
Lead	to 0.94 mg/L	(MWA-1)
Mercury	to 0.00054 mg/l	(MWA-1)
Molybdenum	to 0.028 mg/L	(CW-7)
Nickel	to 14.0 mg/L	(LF-11)
Selenium	to 0.081mg/L	(LF-11)
Thallium	to 0.34 mg/L	(LF-11)
Zinc	to 34,000 mg/L	(LF-11)

Total Dissolved Solids (TDS) ranged in concentration from 860 mg/L in monitoring well CW-7 to 98,800 mg/L in monitoring well LF-11. Field measurements of groundwater pH levels ranged from 3.75 in monitoring well LF-11 to 9.37 in monitoring well CW-7.

A historical summary of metals, total dissolved solids (TDS), and pH detected in groundwater is presented in Table 4. Isoconcentration maps for arsenic, barium, cadmium, and zinc in groundwater are presented in Figures 3, 4, 5, and 6, respectively.

## 7.0 ANNUAL EVALUATION OF RESULTS

An annual review of the historical analytical results for the subject property groundwater monitoring and sampling program indicates that the groundwater quality at the subject property is relatively stable, with the possible exception of petroleum hydrocarbon concentrations at the 5051 and 5200 properties.

The depth to groundwater in the fourth quarter is typically at its lowest level for the year, as the rainy season typically begins during this time of the year. The groundwater elevations appear to have risen slightly in all but three wells, most likely in response to several precipitation events that occurred prior to this monitoring event. An exception was noted during field monitoring of well MWA-3. The groundwater elevation in MWA-3 was found to be more than 6 feet above the average groundwater elevation recorded in this well since 1995. This groundwater elevation is considered to be anomalous and may be due to recent precipitation events and surface runoff impacting the groundwater elevation in this well. The groundwater elevation and condition of this well will be evaluated in future monitoring events.

Petroleum hydrocarbon concentration results in groundwater were evaluated in six wells around the perimeter of a petroleum hydrocarbon plume in groundwater that has its source area in the west and central portions of the 5200 property. Detectable concentrations of TPH-g were found in samples CW-2 and CW-7 and various BTEX compounds were also found in samples MW-4, CW-6, and CW-7. The concentration of benzene equaled or only slightly exceeded the maximum contaminant level (MCL) for drinking water suppliers in samples MW-4 and CW-2. Clayton will further evaluate the petroleum hydrocarbon concentrations in these wells in the next quarterly monitoring event to confirm if this finding is representative of site conditions or is possibly a laboratory contamination problem.

The metal concentrations monitored in 12 wells indicate that the metal concentrations are relatively stable across the Coliseum Way Properties when compared with historic results. Indicator metals used in this evaluation are cadmium and zinc on the west side of the properties and arsenic and barium on the east side of the properties.

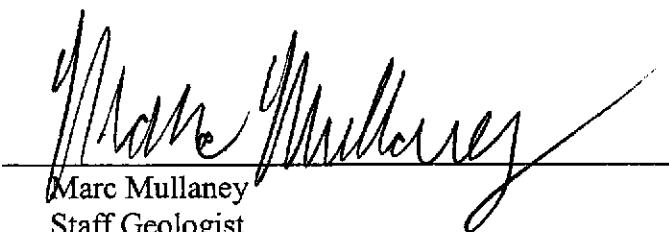

No notable changes in the groundwater quality were noted in groundwater samples collected in the vicinity of the newly constructed groundwater barrier wall on the 5051 property. Clayton proposes to implement quarterly "weep-water" sampling during the next quarterly sampling event. Weep-water sampling will consist of the collection of groundwater samples from the weep holes that are located at the base of the concrete

channel wall along the west side of the 5051 property. Clayton proposes to collect up to 6 samples, if conditions allow, from the same 6 weep holes that were previously sampled on January 13, 1999 (Clayton report: *Additional Remedial Investigation 1999 at 5050, 5051, and 5200 Coliseum Way and 750-50<sup>th</sup> Avenue, Oakland, California*, May 25, 1999). The weep-water samples will be analyzed for soluble barium, cadmium, and zinc. The sampling will be conducted during low-tide events when the holes are exposed.

## 8.0 LIMITATIONS

The information and opinions rendered in this report was prepared on behalf of 5050 Coliseum LLC and Oakland 5051 LLC. The information and opinions included in this report were given in response to a specific scope of work and should be considered and implemented only in light of that particular scope of work. The services provided by Clayton in completing this project have been provided in a manner consistent with the normal standards of the profession. No other warranty, expressed or implied, is made.

**FOOTNOTES:**

(Sb) = Chemical Symbol for Metal (eg. Antimony)

TDS = Total dissolved solids

MCL = Maximum Contaminant Levels for Drinking Water (CCR Title 22, Sections 64431 and 64444)

-- = Not established

<sup>+</sup> = Secondary Drinking Water Standard

<sup>++</sup> = Lead level established by the Federal Copper and Lead Rule for public drinking water suppliers

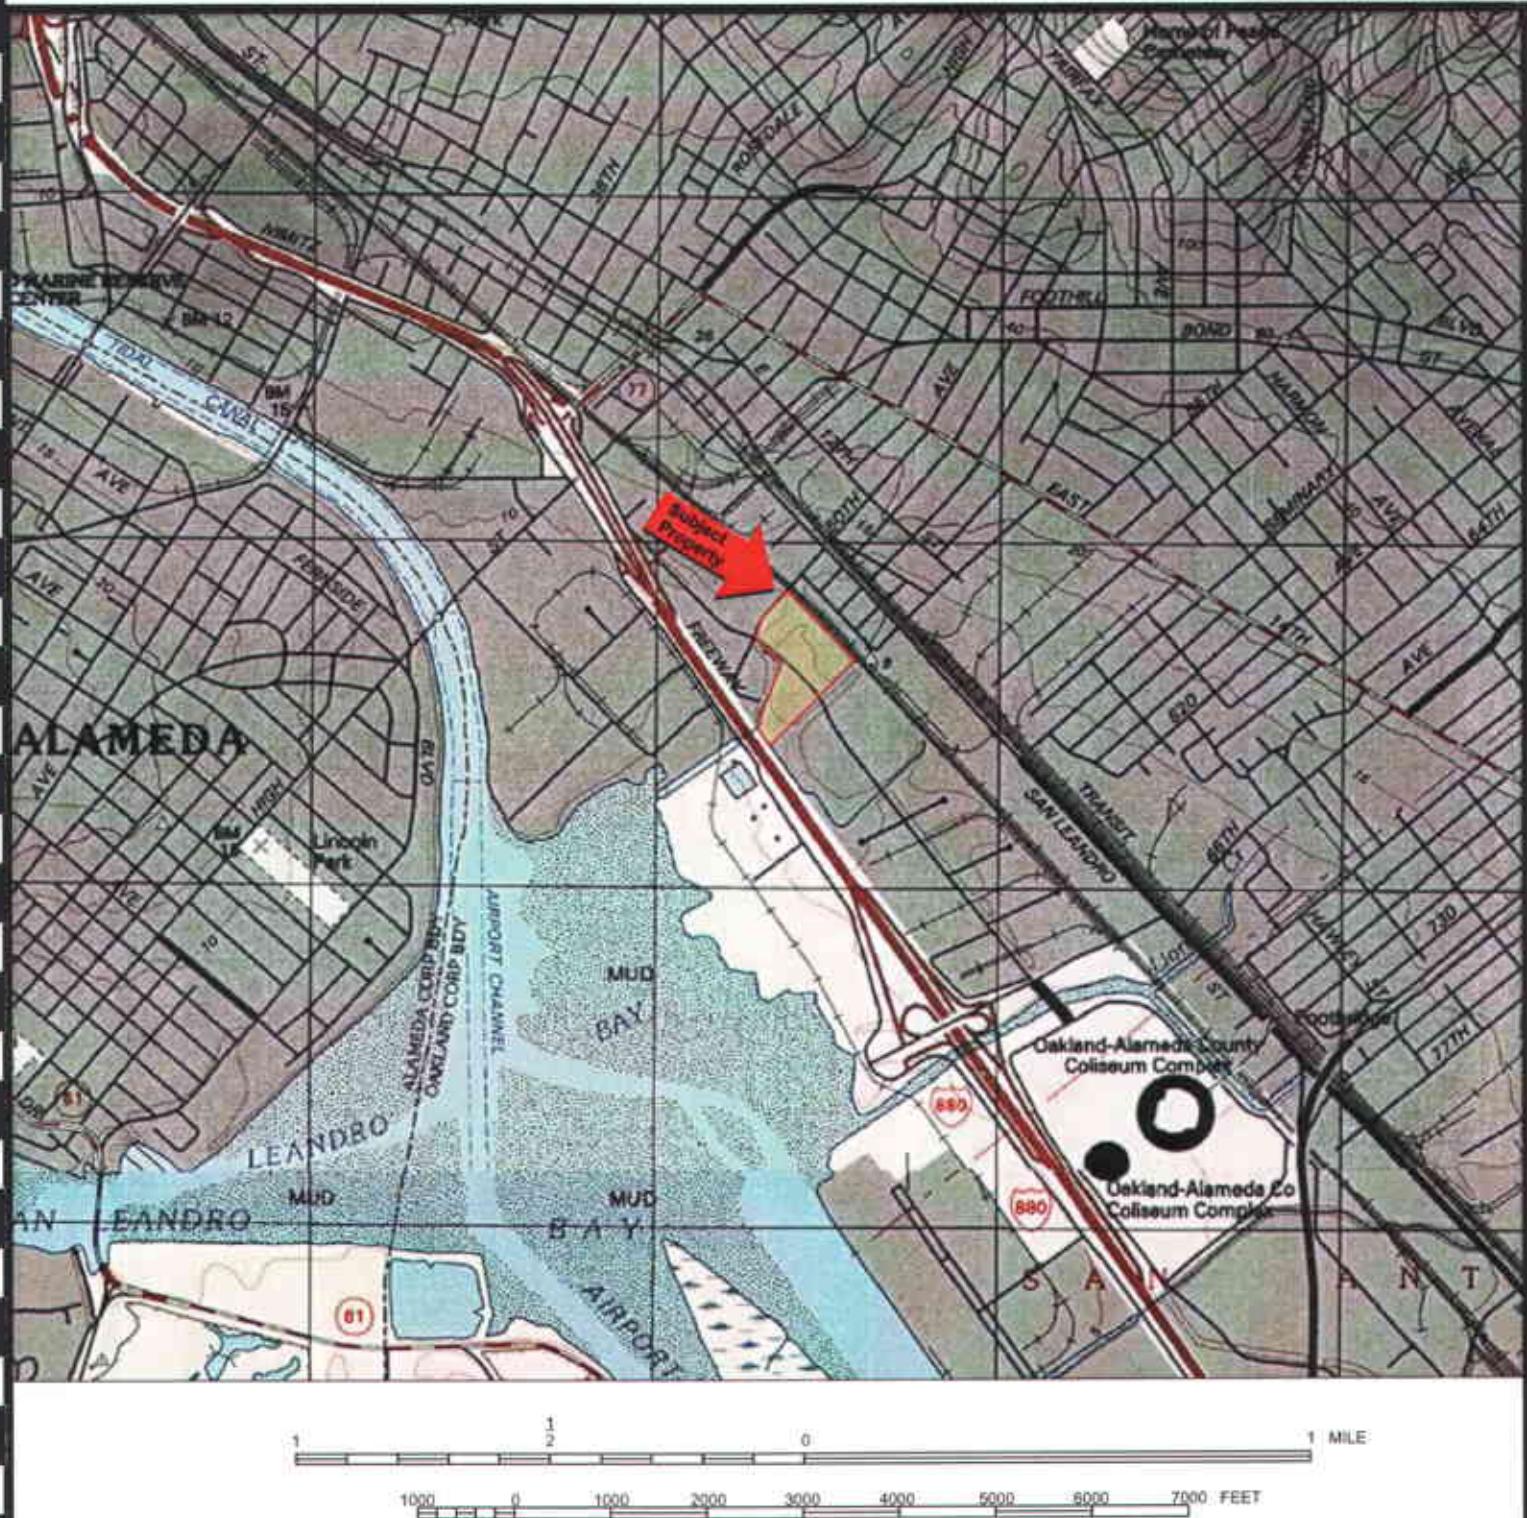

(SU) = Standard Units for pH, typically reported from field data, some are laboratory analysis

\* = Sample date reported as 1992 in tables by LFR (Date corrected to 1991 by Clayton)

(1) = Labeling error in the field or laboratory may account for anomalous data reported for wells MW-2 and MW-3 (LFR)

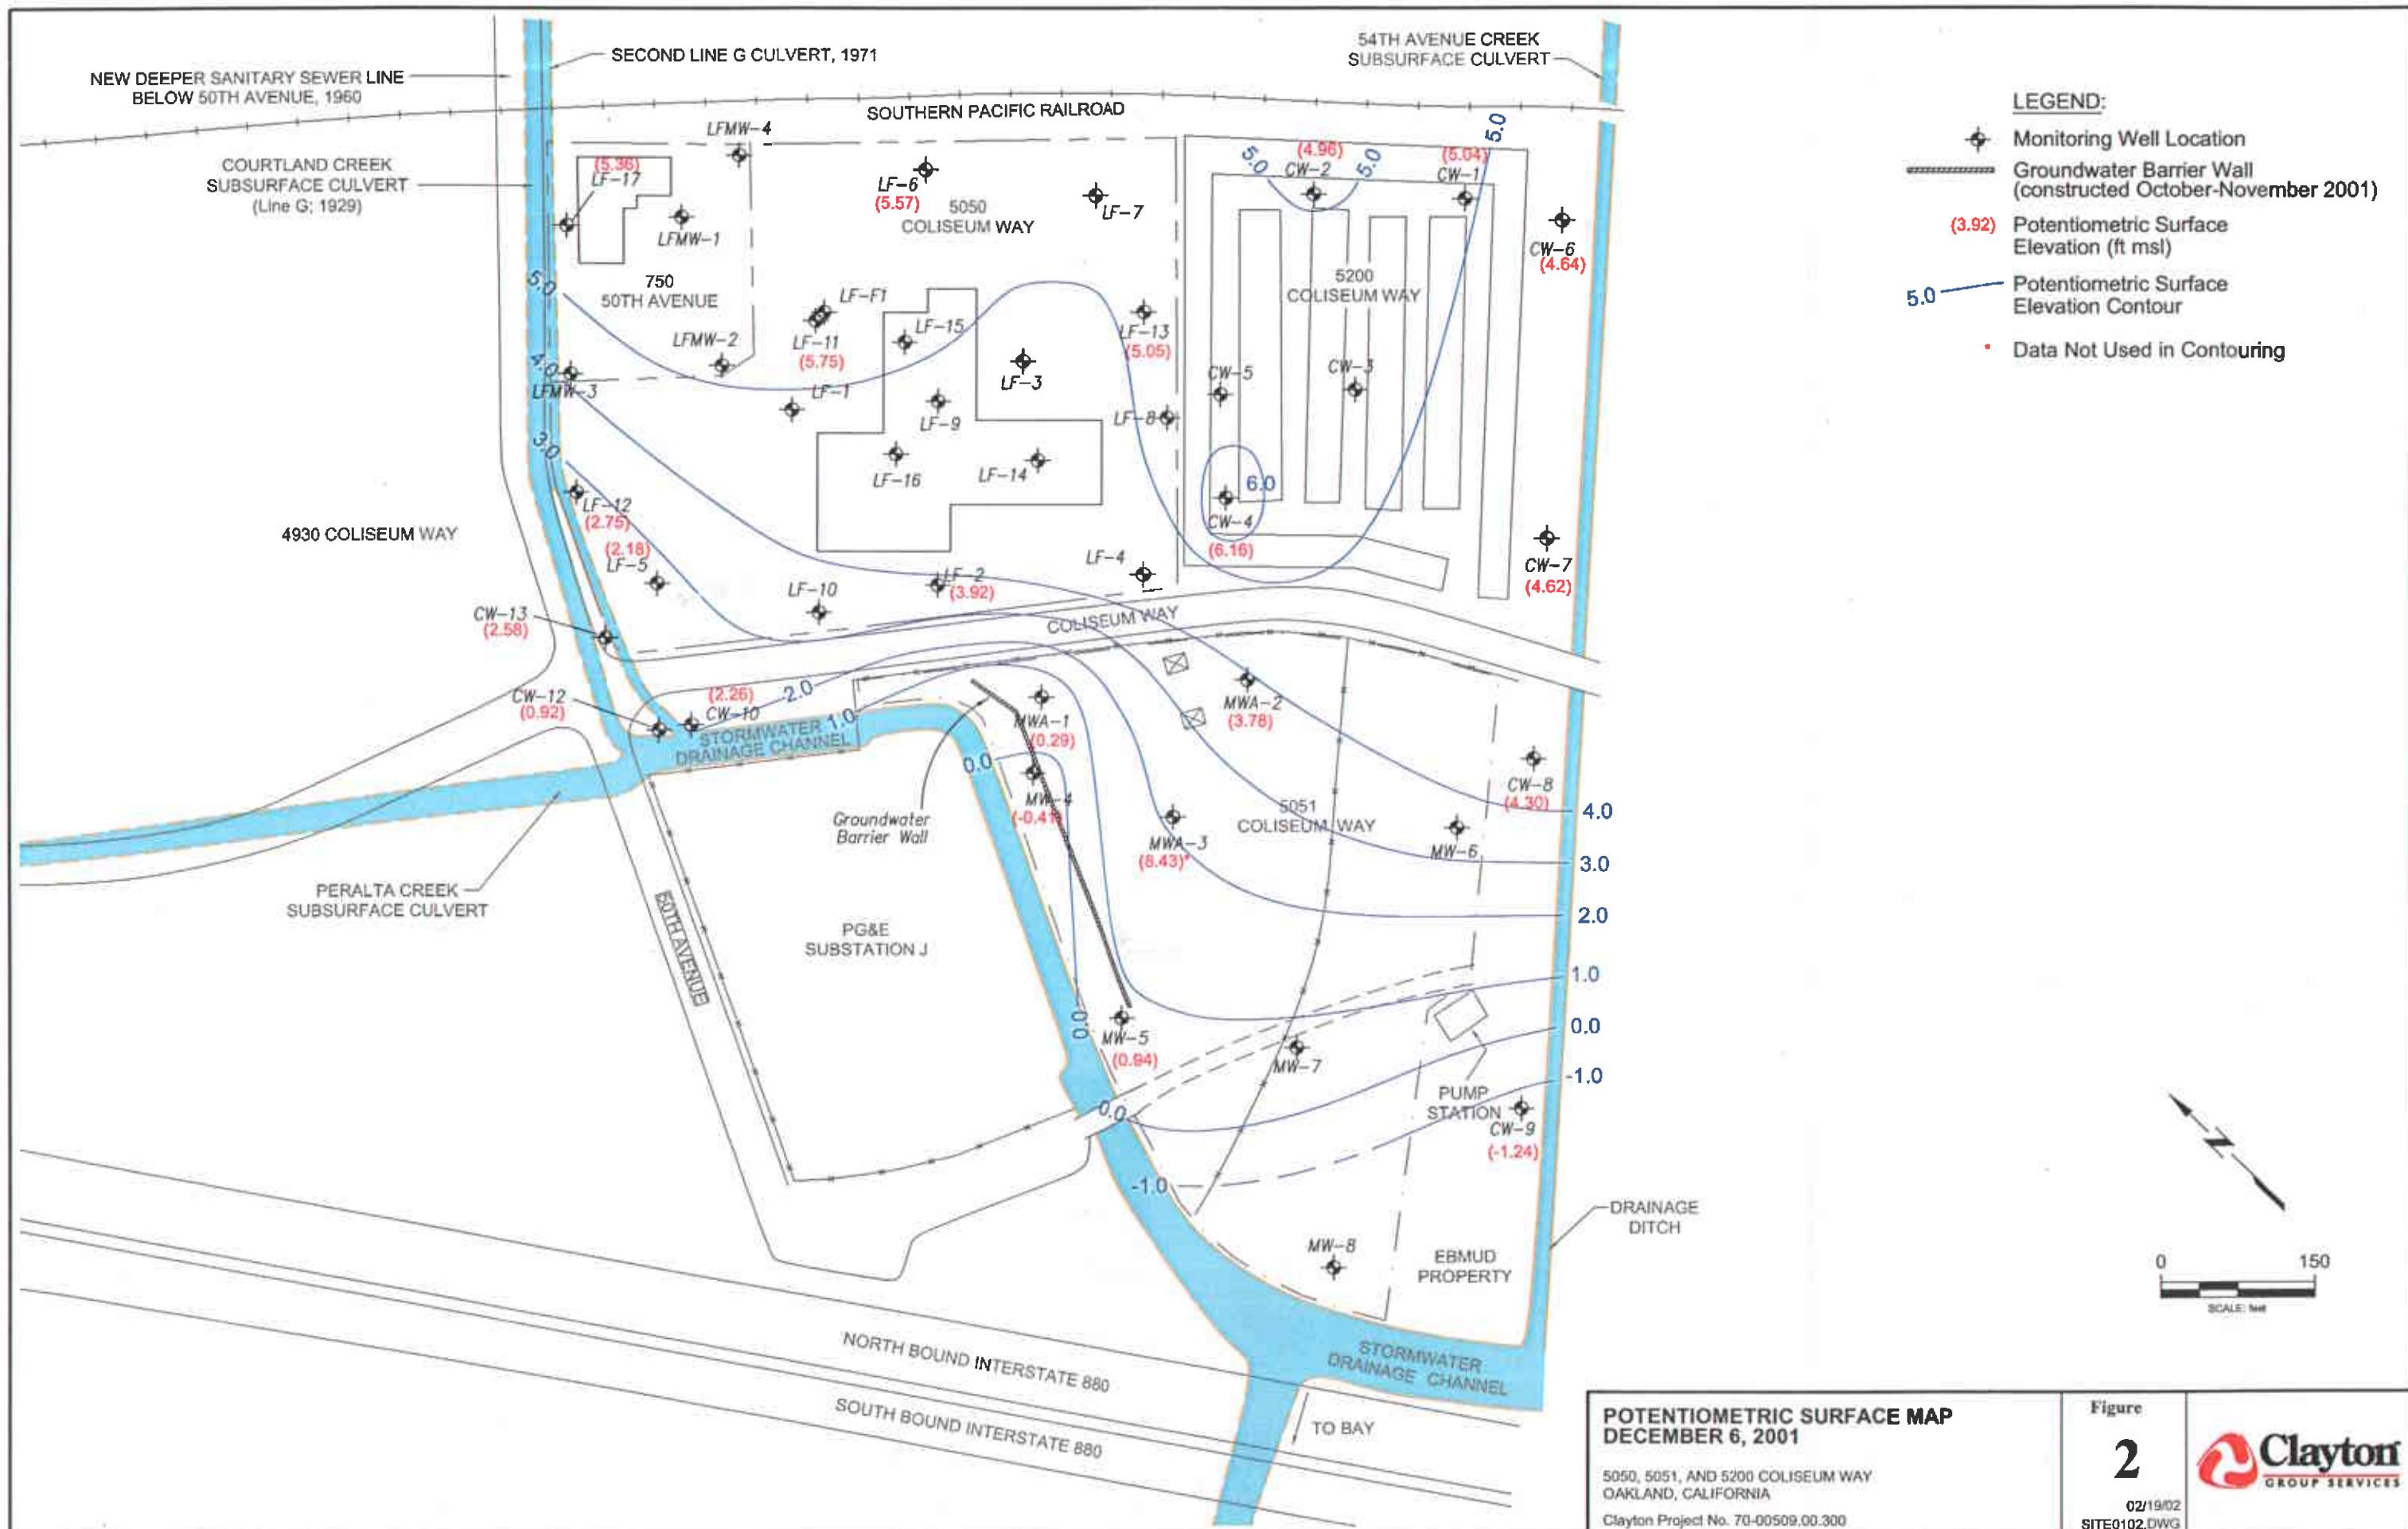

(2) = Labeling error in the field, well numbers reversed (CW-3 and CW-5)

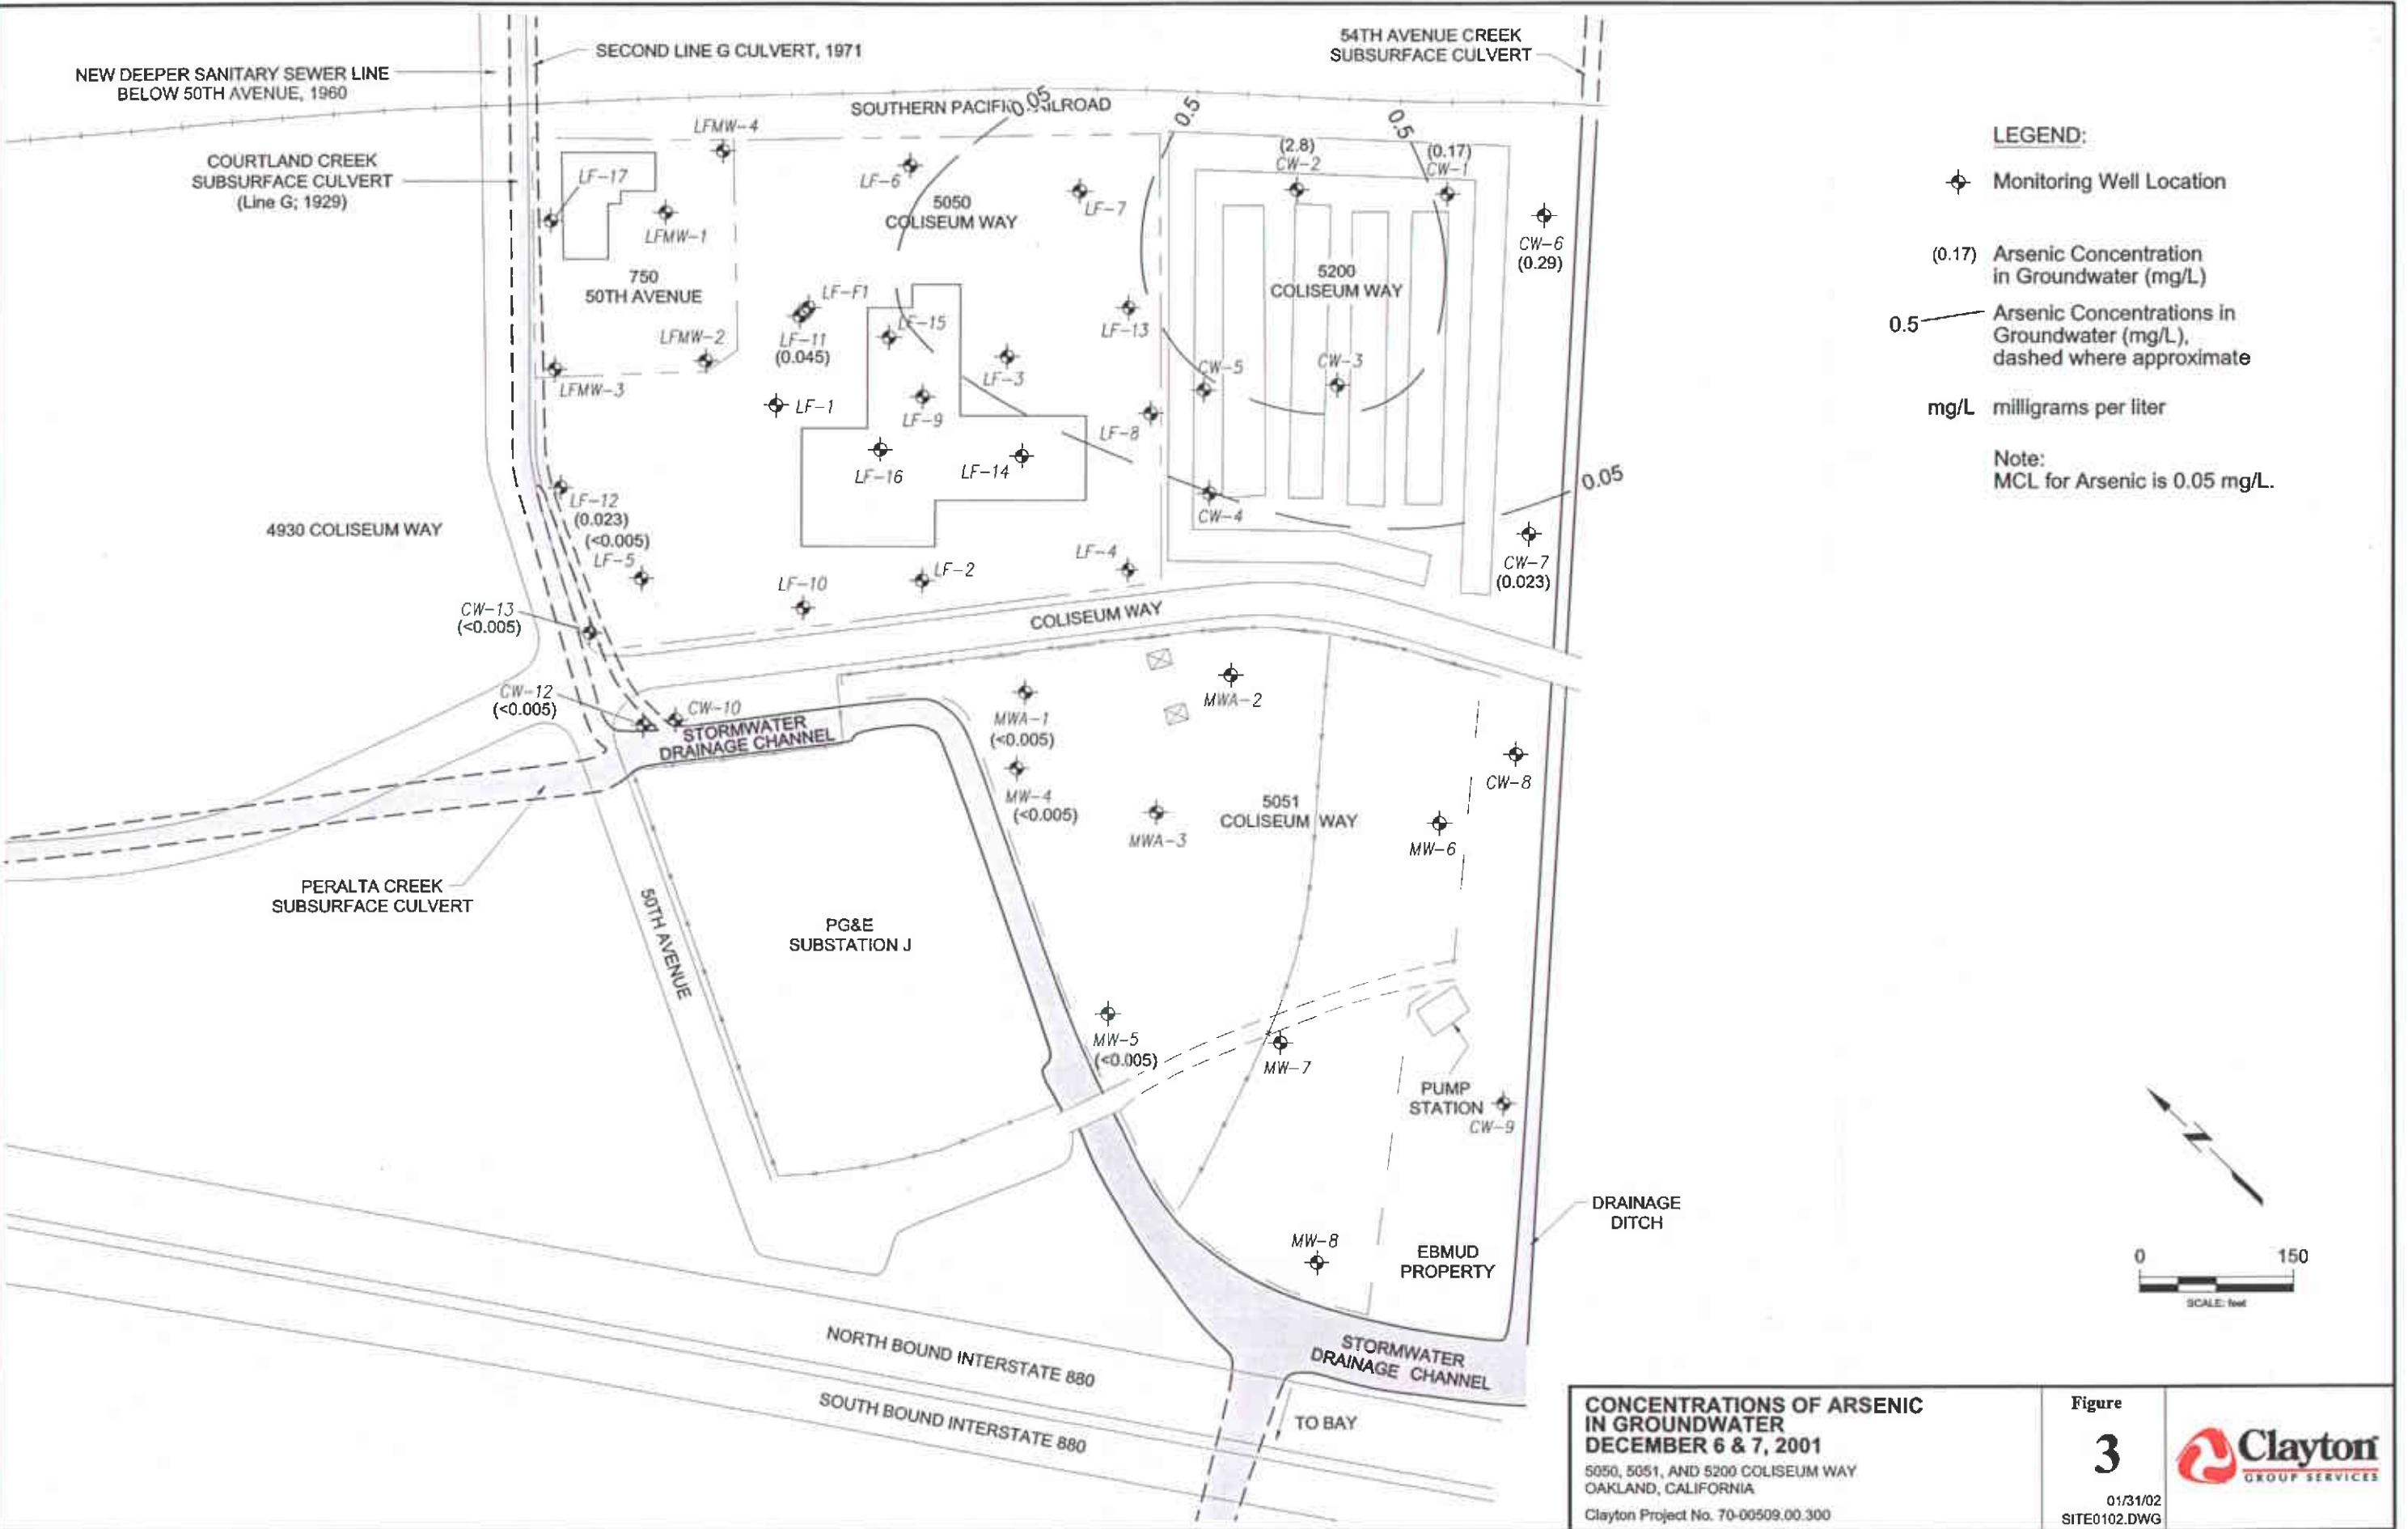

- = Not analyzed
