Clayton Project No. 70-00509.00

Subject: Third Quarter 2002 Groundwater Monitoring Report at 5050, 5051, and
5200 Coliseum Way and 750-50th Avenue, Oakland, California.
SLIC No. 01S0422 (BG)

Dear Ms. Graham:

Enclosed please find Clayton Group Services, Inc.'s (Clayton's) *Third Quarter 2002 Groundwater Monitoring Report at 5050, 5051, and 5200 Coliseum Way and 750-50th Avenue, Oakland, California*. This report presents the results of Clayton's quarterly monitoring conducted in August 2002 at the subject property.

Clayton, under penalty of perjury as an authorized representative of Oakland 5051, LLC, presents this report as true and correct to the best of our knowledge. If you have any questions or comments, please call me at (925) 426-2686.

Sincerely,

A handwritten signature in black ink, appearing to read "Dwight R. Hoenig".

1.0 INTRODUCTION

Clayton Group Services, Inc. (Clayton), performed quarterly groundwater monitoring activities at the Coliseum Way Properties located at 5050, 5051, and 5200 Coliseum Way and 750-50th Avenue in Oakland, California (Figure 1 and Figure 2). The California Regional Water Quality Control Board - San Francisco Bay region (RWQCB), has requested that groundwater monitoring be performed at the subject properties to monitor the fate of petroleum hydrocarbons and metal ions.

The quarterly monitoring and sampling schedule employed is presented in Table 1. The third quarter 2002 monitoring event included collecting depth to water measurements for 21 groundwater-monitoring wells and groundwater samples from 12 wells. Field measurements and groundwater monitoring well sampling were carried out on August 21, 2002. Well (MW-5) was paved over and not accessible on that day; therefore it was not sampled. This report presents groundwater measurements recorded in the field and the results of laboratory analyses performed on groundwater samples collected for the third quarter 2002 monitoring event.

Due to the installation of a groundwater barrier wall on the 5051 property in November 2001, weep water monitoring results are being included in this quarterly report. Weep hole sampling was conducted on September 5 and 6, 2002. Weephole sampling can only be conducted during a low tide with elevations of 0.0 feet msl or less.

2.0 SITE SETTING

The 5050 and 5200 properties are located about 600 feet east of Interstate 880 and the 5051 property is located about 75 feet east of Interstate 880, in Oakland, California. The properties are bordered by stormwater drainage channels that flow into San Leandro Bay, located approximately one-half mile to the west (Figure 1). The 5050 and 5200 properties encompass approximately 10 acres and the 5051 property is approximately 4.4 acres of relatively flat ground approximately 7 to 15 feet above mean sea level (msl). Regionally, groundwater flows from the Oakland Hills west towards San Leandro Bay.

The subject properties and surrounding area have a long history of industrial usage. The 5050 property (which also includes the 750-50th Avenue property) is the location of former lead smelting operations (1879-1903), acids manufacturing (1903-1917), various chemical operations (1917-1926), lithopone manufacturing (1926-1963), vacant or razed property (1963-1974), and truck maintenance operations (1974 to the present). The 5051 property and the mini-storage facility at 5200 property were also part of the former lithopone manufacturing facility.

Tidally influenced stormwater drainage channels border each of the subject properties (Figure 2). An open and unlined channel parallels the southeast property boundary of the 5051 and 5200 properties. Two subsurface culverts, the Courtland Creek Culvert and the Second Line G Culvert, parallel the northwest property boundaries of the 5050 property and the 750-50th Avenue property. The two culverts merge into an open concrete-lined

channel south of the intersection of Coliseum Way and 50th Avenue. The drainage channel is open and concrete-lined along the northwestern perimeter of the 5051 property, and is open and unlined along the southwestern perimeter of the property, prior to flowing under Interstate 880.

Construction of the groundwater diversion barrier, or groundwater barrier wall, was completed between October 30 and November 1, 2001, as a remedial action for the 5051 property as outlined in the site cleanup requirements (Task 4 of Board Order No. 01-032, March 21, 2001). The groundwater barrier wall (approximately 350 feet in length) was constructed of interlocking sheetpiles along the west property boundary (Figure 2) to a total depth of between 15 and 20 feet below ground surface (bgs) to provide a barrier for groundwater that contains elevated concentrations of soluble metals from flowing into the surface water channel that borders this portion of the subject property. During the utility survey of the property, an underground optical cable was identified near the bend in the wall. It was necessary to leave a gap in the wall of approximately 10 feet to clear the utility. On June 17, 2002 Clayton supervised the installation of a neat cement (grout) curtain to close the utility gap and to extend the sheet pile wall approximately 10 feet on the northern end.

3.0 FIELD ACTIVITIES

The following discussion outlines field activities used to obtain depth to water measurements, monitoring well samples, and other field data. Groundwater samples were collected from 11 monitoring wells (CW-1, CW-2, CW-6, CW-7, CW-12, CW-13, LF-5, LF-11, LF-12, MWA-1, and MW-4). Please note that a well MW-5 was buried and inaccessible during the monitoring and sampling event. Clayton will attempt to locate the well prior to the next monitoring and sampling event.

3.1. DEPTH TO WATER MEASUREMENTS

Depth to water measurements were obtained from the 21 of the 22 wells selected for monitoring of the Coliseum Way Properties on August 21, 2002 prior to well purging and sampling activities. Well MW-5 was not included since it was not accessible. The accessible wells were opened and allowed to stabilize prior to measuring the depth to water. Measurements were obtained in a timely manner in order to minimize tidal effects. The depth to water in each monitoring well was measured with a water level indicator meter from the top of the monitoring well casing to the free water surface. The depth to water measurement was used to determine the groundwater elevation at each monitoring well location, and also to determine the groundwater purge volume for each monitoring well. The depth to water measurements were recorded onto groundwater sampling data sheets that were used to calculate the groundwater elevations presented in Table 2.

3.2. MONITORING WELL SAMPLES

The monitoring wells selected for sampling were purged of approximately four well casing volumes of groundwater and the water quality parameters had stabilized or until the well dewatered. A submersible pump was used to purge groundwater from each well. During purging, the groundwater quality was monitored in the field for the following parameters: temperature, pH, specific conductance, and turbidity. The water quality parameters were recorded on groundwater sampling data sheets. After purging, a new disposable bailer was used to collect a groundwater sample from each select monitoring well. Groundwater samples were collected in appropriate laboratory-supplied containers. The containers were sealed, labeled with identifying information, entered onto a formal chain-of-custody document, and placed in a chilled ice-chest for transportation to the laboratory.

4.0 LABORATORY ANALYSES

Groundwater samples were collected from 11 monitoring wells and submitted to Curtis & Tompkins, Ltd. Analytical Laboratory located in Berkeley, California, a State of California certified laboratory, for analyses. The groundwater samples were analyzed by some or all of the following United States Environmental Protection Agency (USEPA) methods:

- EPA Methods 6010 and 7470 for California Assessment Manual (CAM-17) Total Metals, Laboratory Filtered and Preserved
- EPA Methods 160.1 for Total Dissolved Solids (TDS)
- EPA Method 8015 modified for Total Petroleum Hydrocarbons as Gasoline (TPH-G) MW-4, MWA-1, CW-2, CW-6, and CW-7 only.
- EPA Method 8015 modified for Total Petroleum Hydrocarbons as Diesel (TPH-D) and Motor Oil (TPH-O) for LF-11, MWA-1, CW-2, CW-6, and CW-7 only.
- Method 8020 for Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX) for MW-4, MWA-1, CW-2, CW-6, and CW-7 only.

5.0 SITE HYDROLOGY

The groundwater elevation at each monitoring well location was determined by subtracting the depth to water measured in each monitoring well from its surveyed top of casing elevation. The groundwater elevations in the 5050, 5051 and 5200 Coliseum Way monitoring well network ranged from a low of -2.12 feet below msl in monitoring well MW-4 to a high of 6.72 feet above msl in monitoring well CW-4. The groundwater elevation in well CW-12 was recorded at -3.26 feet below msl; however, this reading was deemed to be anomalous and was not used in elevation contouring.

The general property groundwater flow direction is to the west at a hydraulic gradient of 0.011 feet per foot (ft/ft) as measured between wells LF-11 and LF-12. The average groundwater elevation was approximately 0.14 feet higher than the average elevation

recorded on August 21, 2002. The subject property groundwater flow direction has flow components to the southwest and south at the 5051 and 5200 properties, which is apparently a result of the surrounding ditches.

A summary of current and historic depth to groundwater and groundwater elevation data for the monitoring well network at the subject properties is presented in Table 2. A potentiometric surface map was prepared from the June 24, 2002 groundwater elevation data and is presented as Figure 2.

6.0 GROUNDWATER ANALYTICAL RESULTS

The sampling schedule and analytical program for this monitoring event is presented in Table 1. The following discussion presents a summary of the laboratory analytical results.

6.1. PETROLEUM HYDROCARBONS

Six groundwater samples were submitted for petroleum hydrocarbon analyses (CW-2, CW-6, CW-7, LF-11, MWA-1, and MW-4). Detectable TPH-G was only reported in MWA-1 at 0.17 mg/L, only one of the five wells sampled and analyzed for gasoline. BTEX compounds were not present at or above the method detection limits in any of the five samples analyzed, except MWA-1, which reported total xylenes at a concentration of 0.0039 mg/L. No TPH-D/O concentrations were detected in any of the five samples analyzed. A summary of petroleum hydrocarbons detected in groundwater is presented in Table 3.

6.2. METALS

Eleven groundwater samples were submitted for metals analyses. Fourteen of the seventeen CAM 17 metal analytes were detected above laboratory reporting limits during this monitoring event. Antimony, silver and vanadium were the three metals not detected in one or more samples. The highest concentration and corresponding monitoring well location for each detected metal ion are listed below:

Arsenic	to 3.3 mg/L	(CW-2)
Barium	to 400 mg/L	(CW-6)
Beryllium	to 0.053 mg/L	(LF-11)
Cadmium	to 98 mg/L	(LF-11)
Chromium	to 0.015 mg/L	(LF-11 only)
Cobalt	to 3.2 mg/L	(LF-11)
Copper	to 3.1 mg/L	(LF-11)
Lead	to 0.63 mg/L	(MWA-1)
Mercury	to 0.00033 mg/L	(MWA-1 only)
Molybdenum	to 0.047 mg/L	(LF-11)

Nickel	to 14.0 mg/L	(LF-11)
Selenium	to 0.12 mg/L	(LF-11)
Thallium	to 0.52 mg/L	(LF-11)
Zinc	to 31,000 mg/L	(LF-11)

Total Dissolved Solids (TDS) ranged in concentration from 880 mg/L in monitoring well CW-7 to 90,300 mg/L in monitoring well LF-11. Field measurements of groundwater pH levels ranged from 3.71 standard units (SU) in monitoring well LF-5 to 8.79 SU in monitoring well CW-7.

An historical summary of metals, total dissolved solids (TDS), and pH detected in groundwater is presented in Table 4. Isoconcentration maps for arsenic, barium, cadmium, and zinc in groundwater are presented in Figures 3, 4, 5, and 6, respectively.

6.3. WEEP-WATER SAMPLING

Weep-water monitoring was initiated during the Second Quarter 2002 quarterly monitoring event to determine the quality of the groundwater entering the adjacent surface water channel from the 5051 property following the installation of a groundwater barrier wall along the west boundary of the 5051 property. Weep-water monitoring was conducted during a low-tide event by collecting water samples from the exposed drain holes located at the base of the concrete-lined drainage channel wall that parallels a portion of 5051 property. The sampling was conducted where weep-water flow was adequate to allow for the collection of grab-water samples. An effort was made to collect samples from the same weep holes during each sampling event; however, variations in flow do not always allow this and some adjustment in sample locations are made. Weep-water sample locations were identified by sequential numbering of the weep holes counting south from the bend in the channel. The water samples were collected in an appropriate laboratory supplied container and submitted for total metal analyses for arsenic, barium, cadmium, and zinc. These metals were selected as the metals of concern from a previous baseline sampling conducted by Clayton (*Additional Remedial Investigation 1999 at 5050, 5051, and 5200 Coliseum Way and 750-50th Avenue, Oakland, California*, May 25, 1999, Clayton Project No. 70-99203.00.201). The historical analytical results are presented in Table 5 and the sample results and locations are shown on Figure 7.

Clayton conducted weep-hole sampling on September 5 and 6, 2002 during favorable tidal conditions. The metals concentrations in sample WH-4 (barium at 0.029 mg/L, cadmium at 0.25 mg/L, and zinc at 26 mg/L) were all lower than previous quarterly monitoring results but are still somewhat elevated from the 1999 weep-hole No. 4 concentrations. Arsenic was not detected in sample WH-4. Metal results for sample WH-9 (barium at 0.036 mg/L, cadmium at 0.019 mg/L, and zinc at 8.2 mg/L) are similar to past quarterly results but still higher than the 1999 results for wee-hole No. 9. Arsenic was detected in sample WH-9 at 0.0092 mg/L. All other sample results did not indicate any significant changes in metal concentrations between sampling events.

7.0 CONCLUSIONS AND RECOMMENDATIONS

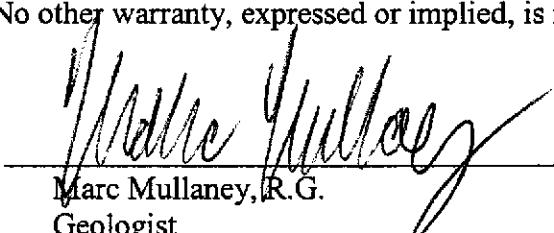

The findings from this and previous quarterly monitoring events indicate that changes in the hydrodynamics of the 5051 property have occurred following the installation of the groundwater barrier wall in November 2001 and grouting of a gap in the wall in June 2002. The barrier wall was installed to divert groundwater flow, primarily to the south along the 5051 property to allow soluble metals to buffer out of the groundwater before reaching the adjacent surface water bodies. Metal concentrations in weep-water samples appear to be stable or potentially decreasing with time. Clayton recommends that weep-water monitoring be continued to confirm this trend.

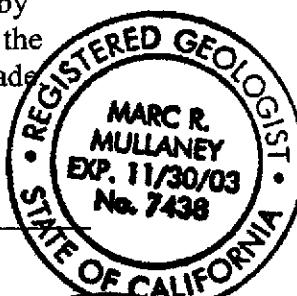

Groundwater monitoring results from the subject property wells indicates that the concentrations of constituents of concern are stable as no significant changes have been noted from the available historical data.

8.0 LIMITATIONS

The information and opinions rendered in this report was prepared on behalf of 5050 Coliseum LLC and Oakland 5051 LLC. The information and opinions included in this report were given in response to a specific scope of work and should be considered and implemented only in light of that particular scope of work. The services provided by Clayton in completing this project have been provided in a manner consistent with the normal standards of the profession. No other warranty, expressed or implied, is made.

Notes:

All results reported in milligrams per liter (mg/L)

TEPH = Total Extractable Petroleum Hydrocarbons

TPH-D = Total Petroleum Hydrocarbons as Diesel

TPH-O = Total Petroleum Hydrocarbons as Motor Oil

TPH-G = Total Petroleum Hydrocarbons as Gasoline

MCL = Maximum Contaminant Levels for Drinking Water (CCR Title 22, Sections 64431 and 64444)

"—" = Not established

"<" = Analytes not detected at reporting limit

"—" = Not analyzed

(dup) = Duplicate Sample Collected by LFR

* = Field error resulted in switched well numbers (CW-3 & CW-5)

rl = TPH laboratory surrogate recovery low due to use of silica gel cleanup, standard is not adjusted for use of silica gel

FOOTNOTES:

(St) = Chemical Symbol for Metal (eg. Antimony)

TDS = Total dissolved solids

MCL = Maximum Contaminant Levels for Drinking Water (CCR Title 22, Sections 64431 and 64444)

-- = Not established

+ = Secondary Drinking Water Standard

++ = Lead level established by the Federal Copper and Lead Rule for public drinking water suppliers

(SU) = Standard Units for pH, typically reported from field data, some are laboratory analysis

* = Sample date reported as 1992 in tables by LFR (Date corrected to 1991 by Clayton)

(1) = Labeling error in the field or laboratory may account for anomalous data reported for wells MW-2 and MW-3 (LFR)

(2) = Labeling error in the field, well numbers reversed (CW-3 and CW-5)

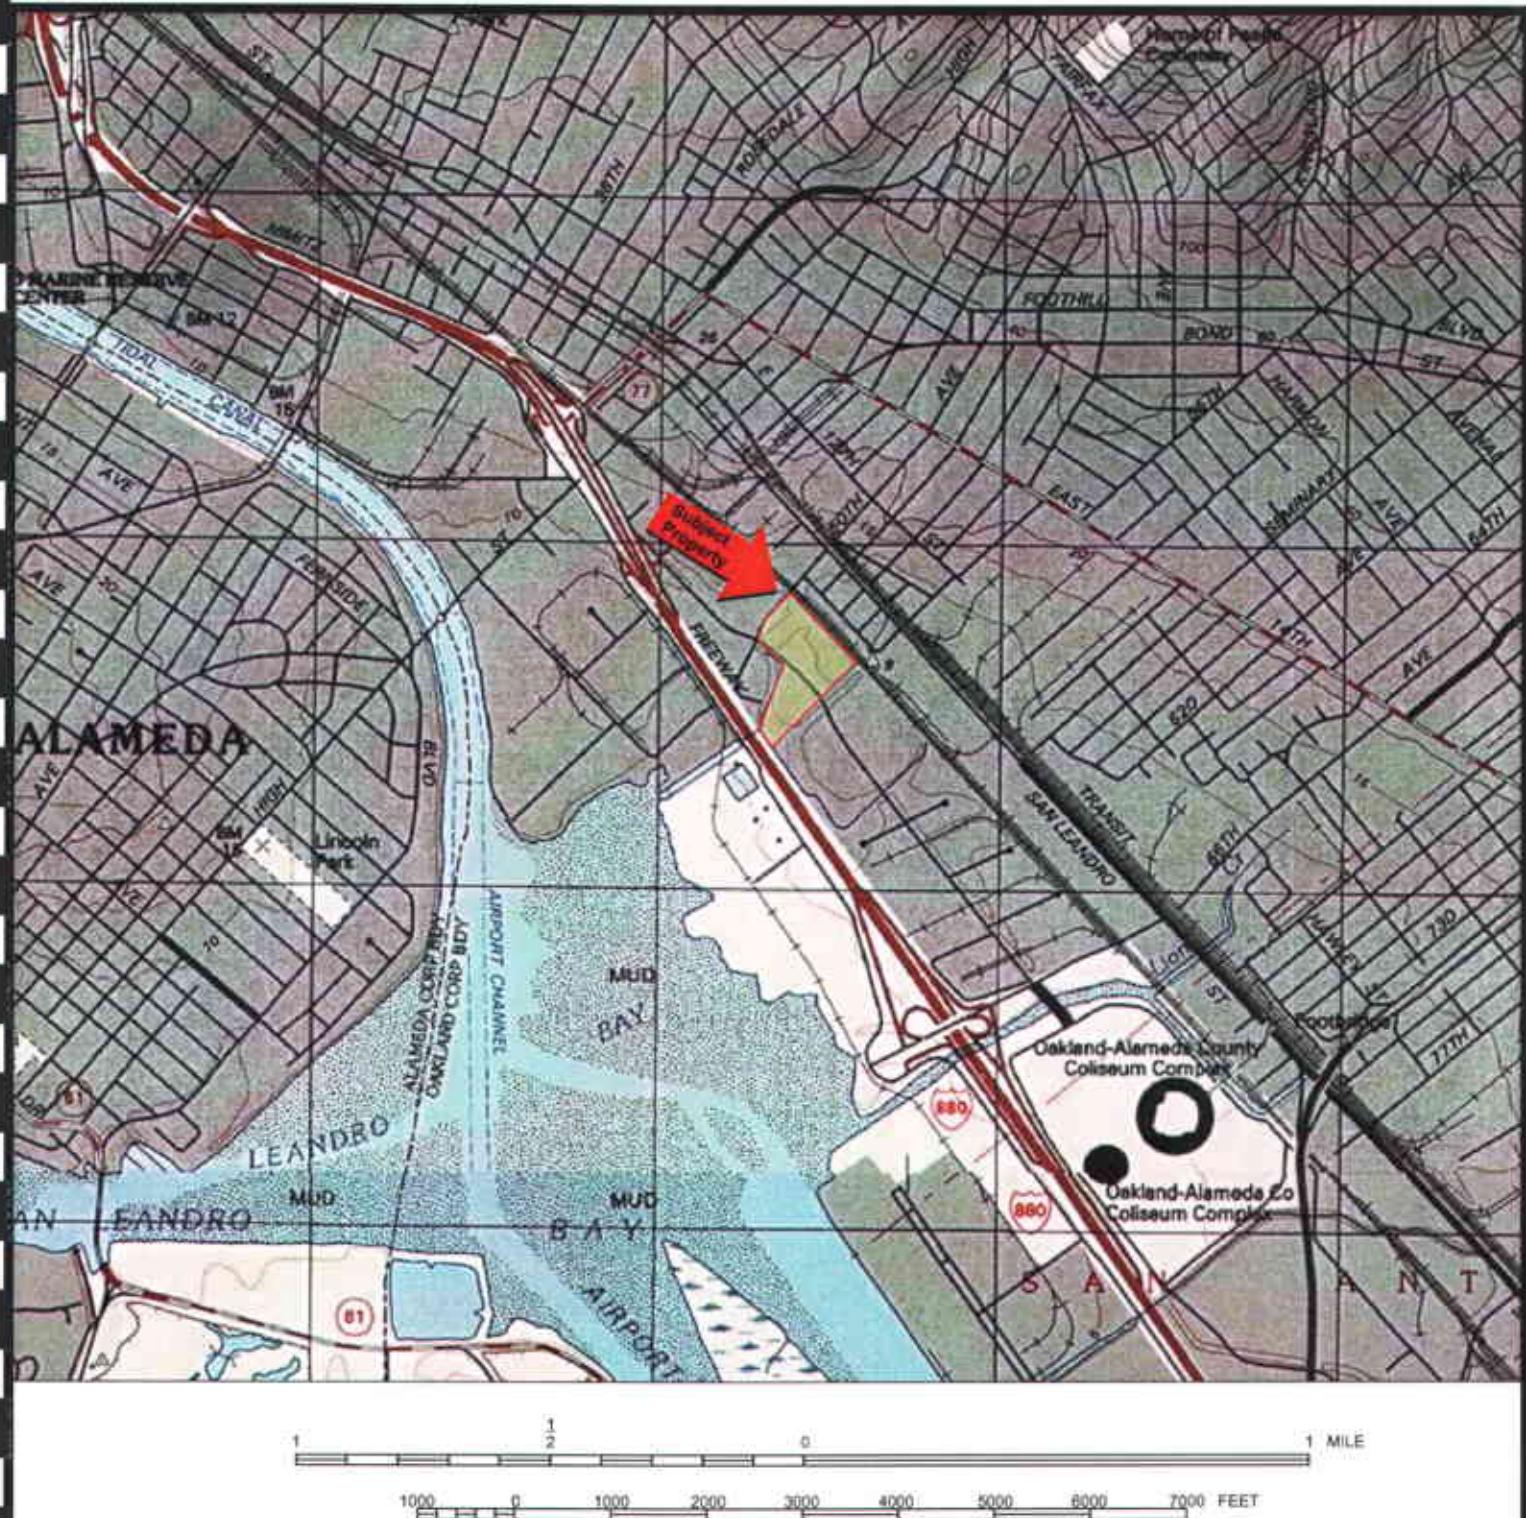

- = Not analyzed
