Subject: Annual Summary and Fourth Quarter 2002 Groundwater Monitoring Report at 5050, 5051, and 5200 Coliseum Way and 750-50th Avenue, Oakland, California. SLIC No. 01S0422 (BG)

Dear Ms. Graham:

Enclosed please find Clayton Group Services, Inc.'s (Clayton's) *Annual Summary and Fourth Quarter 2002 Groundwater Monitoring Report at 5050, 5051, and 5200 Coliseum Way and 750-50th Avenue, Oakland, California*. This report presents the results of Clayton's quarterly monitoring conducted in August 2002 at the subject property.

Clayton, under penalty of perjury as an authorized representative of Oakland 5051, LLC, presents this report as true and correct to the best of our knowledge. If you have any questions or comments, please call me at (925) 426-2686.

Sincerely,

A handwritten signature in black ink, appearing to read "Dwight R. Hoenig".

1.0 INTRODUCTION

Clayton Group Services, Inc. (Clayton), performed quarterly groundwater monitoring activities at the Coliseum Way Properties located at 5050, 5051, and 5200 Coliseum Way and 750-50th Avenue in Oakland, California (Figure 1 and Figure 2). The California Regional Water Quality Control Board - San Francisco Bay region (RWQCB), has requested that groundwater monitoring be performed at the subject properties to monitor the fate of petroleum hydrocarbons and metal ions.

The quarterly monitoring and sampling schedule employed is presented in Table 1. The fourth quarter 2002 monitoring event included collecting depth to water measurements from 22 groundwater-monitoring wells and groundwater samples from 12 wells. Field measurements and groundwater monitoring well sampling were carried out on November 19, 2002. This report presents groundwater measurements recorded in the field and the results of laboratory analyses performed on groundwater samples collected for the fourth quarter 2002 monitoring event.

Due to the installation of a groundwater barrier wall on the 5051 property in November 2001, weep-water monitoring is being conducted on a quarterly basis. Weep hole sampling was conducted on November 19, 2002. As requested by the RWQCB, an Annual Evaluation of the results for the historic quarterly results is included in this report.

2.0 SITE SETTING

The 5050 and 5200 properties are located about 600 feet east of Interstate 880 and the 5051 property is located about 75 feet east of Interstate 880, in Oakland, California. The properties are bordered by stormwater drainage channels that flow into San Leandro Bay, located approximately one-half mile to the west (Figure 1). Regionally, groundwater flows from the Oakland Hills west towards San Leandro Bay. The 5050 and 5200 properties encompass approximately 10 acres and the 5051 property is approximately 4.4 acres of relatively flat ground approximately 7 to 15 feet above mean sea level (msl).

The subject properties and surrounding area have a long history of industrial usage. The 5050 property (which also includes the 750-50th Avenue property) is the location of former lead smelting operations (1879-1903), acids manufacturing (1903-1917), various chemical operations (1917-1926), lithopone manufacturing (1926-1963), vacant or razed property (1963-1974), and truck maintenance operations (1974 to the present). The 5051 property and the mini-storage facility at 5200 property were also part of the former lithopone manufacturing facility.

Tidally influenced stormwater drainage channels border each of the subject properties (Figure 2). An open and unlined channel parallels the southeast property boundary of the 5051 and 5200 properties. Two subsurface culverts, the Courtland Creek Culvert and the Second Line G Culvert, parallel the northwest property boundaries of the 5050 property and the 750-50th Avenue property. The two culverts merge into an open concrete-lined

channel south of the intersection of Coliseum Way and 50th Avenue. The drainage channel is open and concrete-lined along the northwestern perimeter of the 5051 property, and is open and unlined along the southwestern perimeter of the property, prior to flowing under Interstate 880.

Construction of the groundwater diversion barrier, or groundwater barrier wall, was completed between October 30 and November 1, 2001, as a remedial action for the 5051 property as outlined in the site cleanup requirements (Task 4 of Board Order No. 01-032, March 21, 2001). The groundwater barrier wall (approximately 350 feet in length) was constructed of interlocking sheetpiles along the west property boundary (Figure 2) to a total depth of between 15 and 20 feet below ground surface (bgs) to provide a barrier for groundwater that contains elevated concentrations of soluble metals from flowing into the surface water channel that borders this portion of the subject property. During the utility survey of the property, an underground optical cable was identified near the bend in the wall. It was necessary to leave a gap in the wall of approximately 10 feet to clear the utility. On June 17, 2002 Clayton supervised the installation of a neat cement (grout) curtain to close the utility gap and to extend the sheet pile wall approximately 10 feet on the northern end.

The 5051 property was recently paved for use as a parking lot. The new pavement covers virtually the entire property. The paving reportedly occurred in August 2002 to enhance the adjacent Flea Market business. Clayton believes that the paving activity will also assist the remedial efforts that have been put in place for this property by limiting water percolation into the subsurface during the wet months, further limiting the potential migration of soluble metals in groundwater to the adjacent surface water channels. Photographs of the 5051 property showing the paved condition of the property are presented in the Photographs section of this report.

3.0 FIELD ACTIVITIES

The following discussion outlines field activities used to obtain depth to water measurements, monitoring-well and weep-water samples, and other field data.

3.1. DEPTH TO WATER MEASUREMENTS

Depth to water measurements were obtained from all 22 wells selected for monitoring of the Coliseum Way Properties on November 19, 2002 prior to well purging and sampling activities. The wells were opened and allowed to stabilize prior to measuring the depth to water. Measurements were obtained in a timely manner in order to minimize tidal effects. The depth to water in each monitoring well was measured with a water level indicator meter from the top of the monitoring well casing to the free water surface. The depth to water measurement was used to determine the groundwater elevation at each monitoring well location, and also to determine the groundwater purge volume for each monitoring well. The depth to water measurements were recorded onto groundwater sampling data sheets that were used to calculate the groundwater elevations presented in Table 2.

3.2. MONITORING WELL SAMPLES

Groundwater samples were collected from 12 monitoring wells (CW-1, CW-2, CW-6, CW-7, CW-12, CW-13, LF-5, LF-11, LF-12, MWA-1, MW-4 and MW-5) on November 19, 2002. The monitoring wells selected for sampling were purged of approximately four well casing volumes of groundwater until the water quality parameters had stabilized or until the well dewatered. A submersible pump was used to purge groundwater from each well. During purging, the groundwater quality was monitored in the field for the following parameters: temperature, pH, specific conductance, and turbidity. The water quality parameters were recorded on groundwater sampling data sheets. After purging, a new disposable bailer was used to collect a groundwater sample from each select monitoring well. Groundwater samples were collected in appropriate laboratory-supplied containers. The containers were sealed, labeled with identifying information, entered onto a formal chain-of-custody document, and placed in a chilled ice-chest for transportation to the laboratory.

4.0 LABORATORY ANALYSES

Groundwater samples were collected from 12 monitoring wells and submitted to Curtis & Tompkins, Ltd. Analytical Laboratory located in Berkeley, California, a State of California certified laboratory, for analyses. The groundwater samples were analyzed by some or all of the following United States Environmental Protection Agency (USEPA) methods:

- EPA Methods 6010 and 7470 for California Assessment Manual (CAM-17) Total Metals, Laboratory Filtered and Preserved
- EPA Methods 160.1 for Total Dissolved Solids (TDS)
- EPA Method 8015 modified for Total Petroleum Hydrocarbons as Gasoline (TPH-G) MW-4, MWA-1, CW-2, CW-6, and CW-7 only.
- EPA Method 8015 modified for Total Petroleum Hydrocarbons as Diesel (TPH-D) and Motor Oil (TPH-O) for LF-11, MWA-1, CW-2, CW-6, and CW-7 only.
- Method 8020 for Benzene, Toluene, Ethylbenzene, and Xylenes (BTEX) for MW-4, MWA-1, CW-2, CW-6, and CW-7 only.

5.0 SITE HYDROLOGY

The groundwater elevation at each monitoring well location was determined by subtracting the depth to water measured in each monitoring well from its surveyed top of casing elevation. The groundwater elevations in the 5050, 5051 and 5200 Coliseum Way monitoring well network ranged from a low of -1.66 feet below msl in monitoring well MW-4 to a high of 6.01 feet above msl in monitoring well CW-4.

The general property groundwater flow direction is to the west at a hydraulic gradient of 0.010 feet per foot (ft/ft) as measured between wells LF-11 and LF-12. The average groundwater elevation was approximately 0.32 feet lower than the average elevation

recorded during the third quarter monitoring event on August 21, 2002. The subject property groundwater flow direction has flow components to the southwest and south at the 5051 and 5200 properties, which are apparently a result of the surrounding ditches.

A summary of current and historic depths to groundwater and groundwater elevation data for the monitoring well network at the subject properties are presented in Table 2. A potentiometric surface map was prepared from the November 19, 2002 groundwater elevation data and is presented as Figure 2.

6.0 GROUNDWATER ANALYTICAL RESULTS

The sampling schedule and analytical program for this monitoring event is presented in Table 1. The following discussion presents a summary of the laboratory analytical results.

6.1. PETROLEUM HYDROCARBONS

Six groundwater samples were submitted for petroleum hydrocarbon analyses (CW-2, CW-6, CW-7, LF-11, MWA-1, and MW-4). Detectable TPH-G was reported in MWA-1 at 0.46 mg/L and MW-4 at 0.083 mg/L, two of the five wells sampled and analyzed for gasoline. BTEX compounds were not present at or above the method detection limits in any of the five samples analyzed, except MWA-1, which reported benzene at 0.014 mg/L, ethyl benzene at 0.015 mg/L, toluene at 0.010 mg/L, and total xylenes at a concentration of 0.023 mg/L. Out of five samples analyzed, TPH-D/O was detected in LF-11; TPH-D was reported at 0.06 mg/L, and TPH-O at 0.41 mg/L. A summary of petroleum hydrocarbons detected in groundwater is presented in Table 3.

6.2. METALS

Twelve groundwater samples were submitted for metals analyses. Fifteen of the seventeen CAM 17 metal analytes were detected above laboratory reporting limits during this monitoring event. Antimony and vanadium were the only metals not detected in one or more samples. The highest concentration and corresponding monitoring well location for each detected metal ion are listed below:

Arsenic	to 3.1 mg/L	(CW-2)
Barium	to 490 mg/L	(CW-6)
Beryllium	to 0.056 mg/L	(LF-11)
Cadmium	to 92 mg/L	(LF-11)
Chromium	to 0.078 mg/L	(LF-11)
Cobalt	to 3.2 mg/L	(LF-11)
Copper	to 2.8 mg/L	(LF-11)
Lead	to 0.5 mg/L	(MWA-1)
Mercury	to 0.00055 mg/L	(MWA-1)
Molybdenum	to 0.023 mg/L	(LF-11)

Nickel	to 14.0 mg/L	(LF-11)
Selenium	to 0.1 mg/L	(LF-11)
Silver	to 0.017 mg/L	(LF-11)
Thallium	to 0.53 mg/L	(LF-11)
Zinc	to 48,000 mg/L	(LF-11)

Total Dissolved Solids (TDS) ranged in concentration from 940 mg/L in monitoring well CW-7 to 64,300 mg/L in monitoring well LF-11. Field measurements of groundwater pH levels ranged from 3.5 standard units (SU) in monitoring well LF-11 to 9.61 SU in monitoring well CW-7.

An historical summary of metals, total dissolved solids (TDS), and pH detected in groundwater is presented in Table 4. Isoconcentration maps for arsenic, barium, cadmium, and zinc in groundwater are presented in Figures 3, 4, 5, and 6, respectively.

6.3. WEEP-WATER SAMPLING

Weep-water monitoring was initiated during the Second Quarter 2002 quarterly monitoring event to determine the quality of the groundwater entering the adjacent surface water channel from the 5051 property following the installation of a groundwater barrier wall along the west boundary of the 5051 property. Weep-water monitoring was conducted during a low-tide event by collecting water samples from the exposed drain holes located at the base of the concrete-lined drainage channel wall that parallels a portion of the 5051 property. The sampling was conducted where weep-water flow was adequate to allow for the collection of grab-water samples. An effort was made to collect samples from the same weep holes during each sampling event; however, variations in the limited flow (Clayton estimated that the weeping from all of the drain holes along the channel wall at approximately one-gallon per minute during the first sampling event in 1999) does not always allow this and some adjustment in sample locations are periodically made. Weep-water sample locations are identified by sequential numbering of the weep holes counting south from the bend in the channel. The water samples were collected in an appropriate laboratory supplied container and submitted for total metal analyses for arsenic, barium, cadmium, and zinc. These metals were selected as the metals of concern from a previous baseline sampling conducted by Clayton (*Additional Remedial Investigation 1999 at 5050, 5051, and 5200 Coliseum Way and 750-50th Avenue, Oakland, California*, May 25, 1999, Clayton Project No. 70-99203.00.201). The historical analytical results are presented in Table 5 and the sample results and locations are shown on Figure 7.

Clayton conducted weep-hole sampling on November 19, 2002 during favorable tidal conditions. The metals concentrations in sample WH-4 (barium at 0.026 mg/L, cadmium at 0.15 mg/L, and zinc at 23 mg/L) were all lower than previous quarterly monitoring results but are still somewhat elevated from the 1999 weep-hole No. 4 concentrations. Arsenic was not detected in sample WH-4. Metal results for sample WH-9 (Arsenic at 0.024 mg/L, barium at 0.022 mg/L, cadmium at 0.02 mg/L, and zinc at 8.8 mg/L) are similar to past quarterly results but still higher than the 1999 results for weep-hole No. 9.

Although arsenic was detected for the first time in sample WH-14 at 0.0042 mg/L, other metals results from WH-14 (barium at 0.019 mg/L and zinc at 0.49 mg/L) were lower than the previous quarterly monitoring. All other sample results did not indicate any significant changes in metal concentrations between sampling events.

7.0 ANNUAL EVALUATION OF RESULTS

An annual review of the historical analytical results for the subject property groundwater monitoring and sampling program indicates that the groundwater quality at the subject property is relatively stable, with the possible exception of petroleum hydrocarbon concentrations at the 5051 property and the zinc concentrations at the 5050 property.

The depth to groundwater in the fourth quarter is typically at its lowest level for the year, as the rainy season typically begins during this time of the year. The groundwater elevations appear to be at levels typical for this time of year when compared to the past five years. The five-year average groundwater elevation was computed for each well of the 22 wells monitored and 13 were below, 7 were above, and 2 were at the average elevation for each well. This has been a "dry" year for precipitation; therefore, the recorded groundwater elevations appear to reflect this when averaged overall.

Petroleum hydrocarbon concentration results in groundwater were evaluated in six wells around the perimeter of a petroleum hydrocarbon plume that has its source area in the west and central portions of the 5200 property. Detectable concentrations of TPH-g were found in samples MWA-1 at 0.46 mg/L and MW-4 at 0.083 mg/L. BTEX compounds were only found in sample MWA-1, with benzene at 0.014 mg/L, a concentration that exceeds the maximum contaminant level (MCL) for drinking water suppliers. Gasoline and benzene have been detected in MWA-1 historically. The historic benzene concentrations in well MWA-1 are not always at detectable concentrations; however, this event's concentration is the highest historical concentration to date. Clayton will further evaluate the petroleum hydrocarbon concentrations in these wells in the following quarterly monitoring events to confirm if this finding is representative of a change in site conditions.

Indicator metals used in this evaluation are cadmium and zinc on the west side of the properties and arsenic and barium on the east side of the properties. The metal concentrations monitored in 12 wells indicate that the metal concentrations are relatively stable across the Coliseum Way Properties when compared with historic results, with one exception being the zinc concentrations in well LF-11. The zinc concentrations in well LF-11 appeared to significantly decrease with time by more than an order of magnitude to a low of 1,400 mg/L between 1993 and March 2000. In December 2000 the zinc concentration was reported at 26,000 mg/L and now is reported at 48,000 mg/L. The historical data for other metals suggests subtle possible changes in concentrations in December 2000; however, they are not distinctive. Clayton cannot fully explain this variation in the data; however, a change in the use of the property may be the reason.

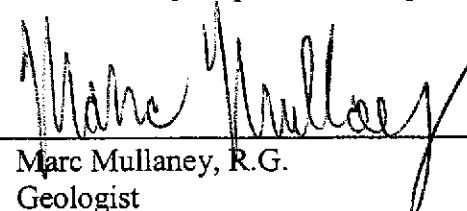

In late 2000, the City of Oakland, the tenant on the 5050 property, constructed a new truck wash facility with an in-ground sump about 75 feet to the southeast. Construction of the sump impacted the shallow aquifer that is monitored by well LF-11 and the use of the truck wash appears to have resulted in daily operational changes at the vehicle maintenance yard, in particular, wash water run off to storm drains appears to have been eliminated. It would appear that well LF-11 may have been impacted by changes to the shallow aquifer during construction and or by surface run off that may have impacted the well through infiltration at the surface cover well box. It should be noted that this well is in an area heavily trafficked by trucks and tractors and is in a low area that is impacted by surface runoff. The well box was damaged and repaired several years ago, exact time not known. Since the well is near the center of the property and near the heart of the buried waste slag debris that was left from the former smelting operations at or before the turn of the last century, Clayton believes that there is no immediate concern for off site migration of the soluble metal. Clayton will continue to monitor the condition of this well and evaluate the metal concentrations in this and other wells in the area.

Historic groundwater and weep-water results for the 5051 property indicate that changes in the hydrodynamics of groundwater occurred in the area of the groundwater-barrier wall that was installed in November 2001. Also, a gap in the wall was grouted in June 2002. The barrier wall was installed to divert groundwater flow, primarily to the south along the 5051 property to allow soluble metals to buffer out of the groundwater before reaching the adjacent surface water bodies. Although there appears to have been an increase in some of the metals concentrations in two of the weep-water samples collected in February 2000 when compared with the first round of weep-water sampling in January 1999, it appears that the soluble metals in groundwater entering the adjacent storm water channel are returning to the concentrations similar to those reported for the initial 1999 sampling. One possible exception is the soluble zinc concentrations found in weep-hole number 9. The concentrations are about three times the concentration reported in 1999; however, the amount of data collected to date is not considered sufficient to establish this as a trend. It should be noted that the groundwater flowing into the channel is truly weeping and these subtle concentration changes are not believed to constitute a significant change in the migration of soluble metals to surface waters. Clayton will continue to monitor the weep-water metal concentrations.

8.0 LIMITATIONS

The information and opinions rendered in this report was prepared on behalf of 5050 Coliseum LLC and Oakland 5051 LLC. The information and opinions included in this report were given in response to a specific scope of work and should be considered and implemented only in light of that particular scope of work. The services provided by Clayton in completing this project have been provided in a manner consistent with the normal standards of the profession. No other warranty, expressed or implied, is made.

Notes: reference to top of PVC casing of each well.

-- = Not Measured

** = approximately 0.10 feet of free product encountered in well casing.

1 = Sheen

2 = Sheen and Petroleum Odor

3 = Sulfur Odor

4 = Sheen and Sulfur Odor

a = Field error in numbering wells, CW-3 and CW-5 reversed

^ = High Tide Measurement

~ = Low Tide Measurement

A = Well covered repaired and TOC resurveyed (10/12/98)

B = TOC resurveyed (10/12/98) - MW-6 discrepancy confirmed 12-3-98

Notes:

All results reported in milligrams per liter (mg/L)

TEPH = Total Extractable Petroleum Hydrocarbons

TPH-D = Total Petroleum Hydrocarbons as Diesel

TPH-O = Total Petroleum Hydrocarbons as Motor Oil

TPH-G = Total Petroleum Hydrocarbons as Gasoline

MCL = Maximum Contaminant Levels for Drinking Water (CCR Title 22, Sections 64431 and 64444)

"--" = Not established

"<" = Analytes not detected at reporting limit

"_" = Not analyzed

(dup) = Duplicate Sample Collected by LFR

* = Field error resulted in switched well numbers (CW-3 & CW-5)

rl = TPH laboratory surrogate recovery low due to use of silica gel cleanup, standard is not adjusted for use of silica gel

FOOTNOTES:

(Sb) = Chemical Symbol for Metal (eg. Antimony)

TDS = Total dissolved solids

MCL = Maximum Contaminant Levels for Drinking Water (CCR Title 22, Sections 64431 and 64444)

-- = Not established

⁺ = Secondary Drinking Water Standard

⁺⁺ = Lead level established by the Federal Copper and Lead Rule for public drinking water suppliers

(SU) = Standard Units for pH, typically reported from field data, some are laboratory analysis

* = Sample date reported as 1992 in tables by LFR (Date corrected to 1991 by Clayton)

(1) = Labeling error in the field or laboratory may account for anomalous data reported for wells MW-2 and MW-3 (LFR)

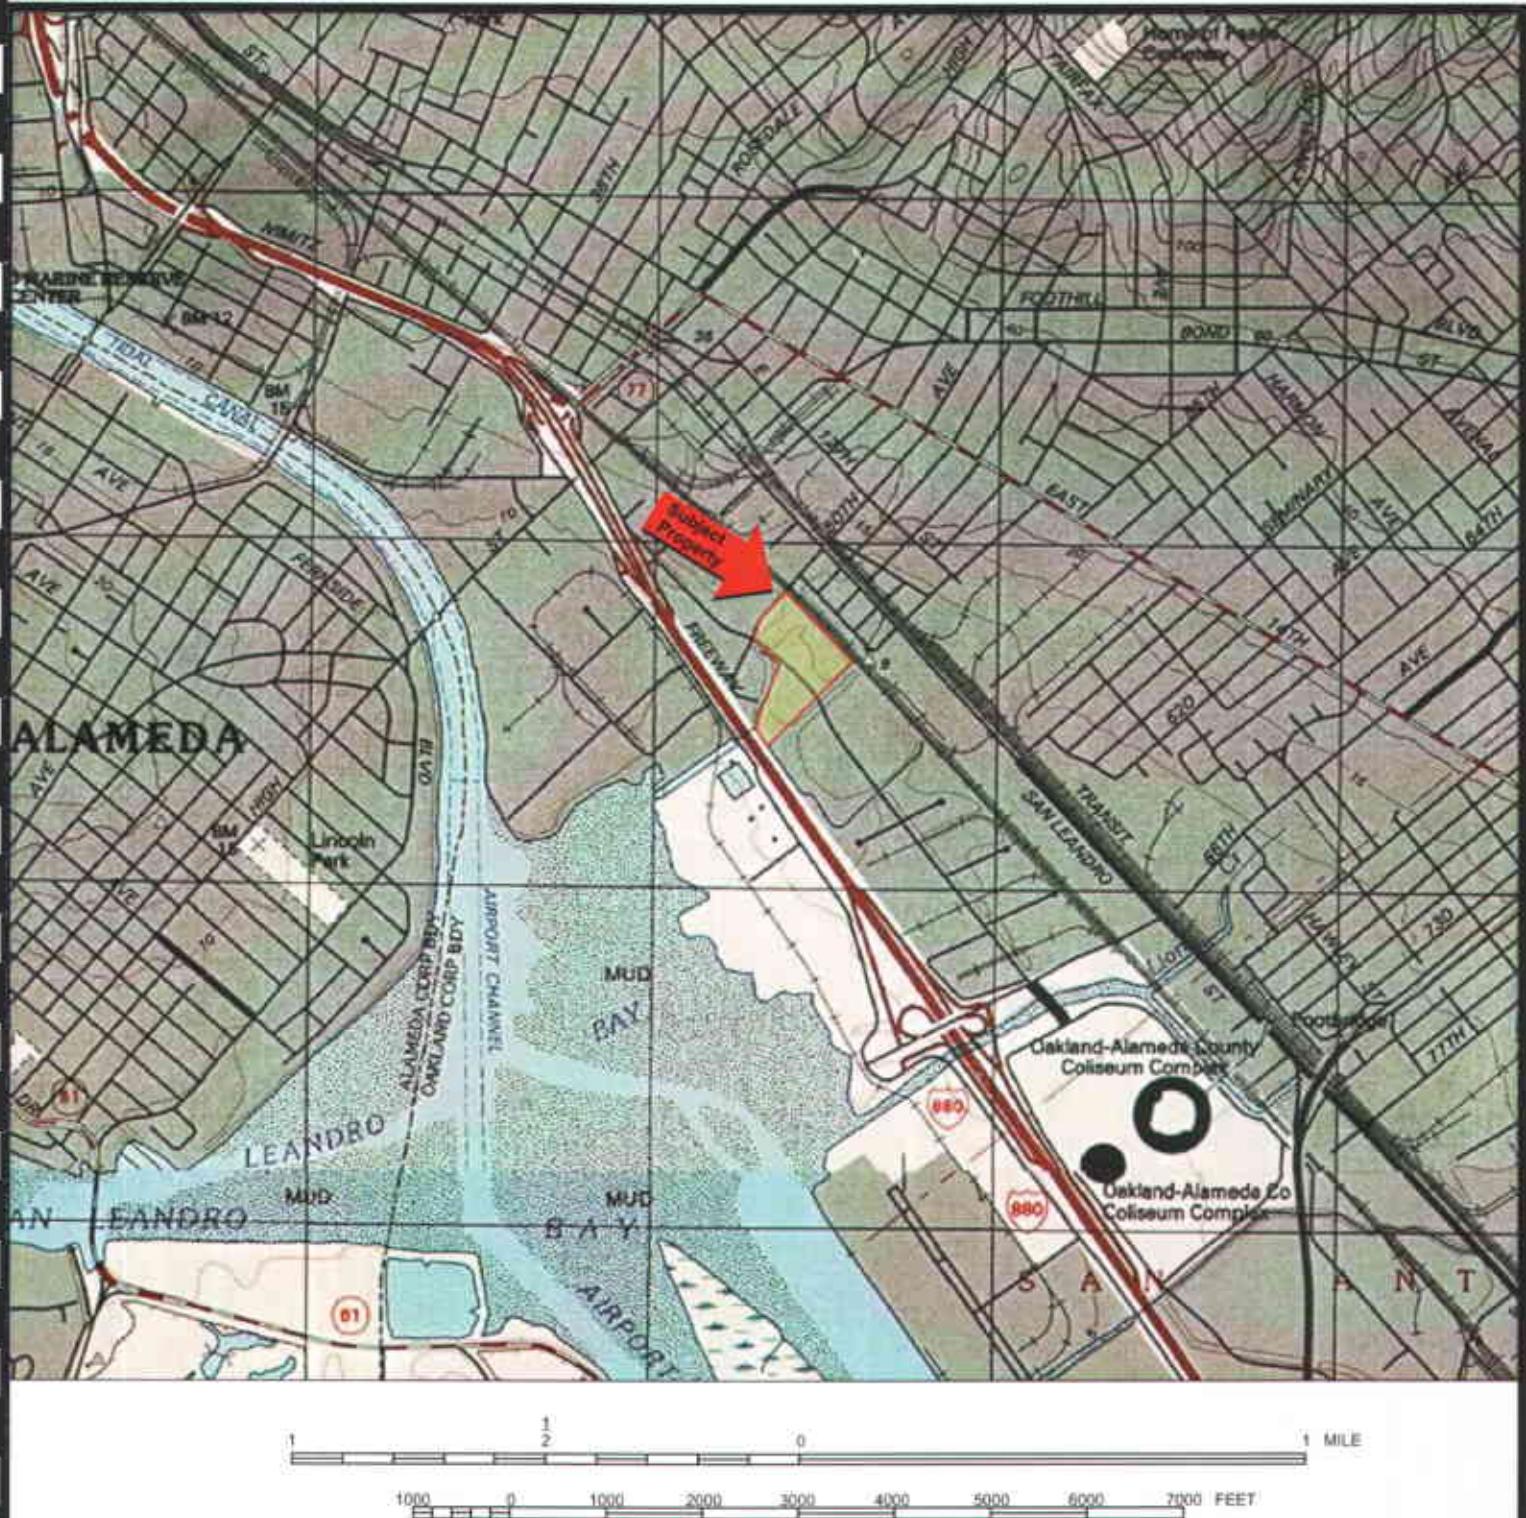

(2) = Labeling error in the field, well numbers reversed (CW-3 and CW-5)

- = Not analyzed
