**SUBJECT:** REPLACEMENT SUBSURFACE INVESTIGATION REPORTS FOR KEEP ON TRUCKING AT 370 8TH STREET, OAKLAND, CALIFORNIA - FORMER ABOVEGROUND STORAGE TANK FACILITY (ADJACENT TO FORMER BUILDING H-213) AND FORMER UNDERGROUND STORAGE TANK FACILITY (ADJACENT TO BUILDING H-107)

Dear Mr. Chan:

Enclosed please find replacement Quarterly Groundwater Sampling Reports for the second quarter of 1996 at the former aboveground tank site adjacent to former Building H-213 and former underground storage tank adjacent to Building H-107 located at Keep on Trucking facilities.

Our original submittal dated 15 August 1996 contained reports that were inadvertently unsigned. These replacement reports are identical but include the appropriate preparer signatures. The original reports should therefore be discarded and substituted with these replacements.

If you have any questions or need additional information, please call me at (510) 272-1118.

Sincerely,

Jeffrey L. Rubin, CPSS, REA  
Associate Environmental Scientist  
Environmental Health and  
Safety Compliance

## **1.0 INTRODUCTION**

Subsurface Consultants, Inc. (SCI) was retained to perform quarterly groundwater sampling and analysis at the Keep on Trucking Facility located at 370-8th Avenue in Oakland, California (Figure 1). On May 24, 1996 SCI collected groundwater samples from monitoring wells MW-1 through MW-6 located near the former location of Building H-213. The monitoring well locations are shown on Figure 2.

## **2.0 BACKGROUND**

In October 1992, the United States Coast Guard (USCG) noted diesel fuel in Clinton Basin. A subsequent investigation by the Port of Oakland (PORT) identified diesel fuel in storm drains at the Ninth Avenue Terminal. Further investigations by the PORT indicated that the source of diesel was a leaking underground pipe connected to a diesel above ground storage tank (AST) at the subject site. The diesel AST was operated by the Keep on Trucking Company.

The diesel fuel system was disconnected in December 1992, and was removed by February 1993. In September 1993, Uribe and Associates conducted a subsurface investigation at the former location of the diesel fuel AST which consisted of installing and sampling four monitoring wells (MW-1 through MW-4).

While developing the four monitoring wells in September 1993, four to twelve inches of separate phase petroleum hydrocarbons (free product) was observed floating on the groundwater surface in monitoring well MW-4. Monitoring well MW-4 was purged once a week from September to November 1993. According to the Uribe and Associates report dated December 2, 1993, bailing activities ceased on November 1, 1993, after all the diesel had apparently been removed. However, during the quarterly groundwater monitoring and sampling event in June and September 1994, six to ten inches of free product were noted again in monitoring well MW-4. No bailing of the floating product was performed; however, a passive skimmer was installed in monitoring well MW-4 on April 10, 1995.

During a subsequent subsurface investigation performed by Clayton Environmental Consultants (Clayton) in March 1995, two additional monitoring wells (MW-5 and MW-6) were installed at the site (Figure 2). In April 1995, free product was identified in monitoring well MW-6 and dissolved petroleum hydrocarbons were present in monitoring well MW-5. Free product thickness and measured groundwater levels are summarized in Table 1.

Recovered free product collected from monitoring well MW-4 was transferred to a storage drum on a bi-monthly basis from April 17, 1995 through July 19, 1995. The storage drum is located within secondary containment. The volume of free product recovered by April 18, 1995 was approximately 0.10 gallons; however, only 0.01 gallons of free product was recovered over the next four weeks on May 12, 1995. No free product was recovered in the passive skimmer in MW-4 between May 16, 1995 and July 14, 1995. The passive skimmer was removed from MW-4 on July 19, 1995. Between 0.04 to 0.23 feet of free product was detected in MW-4 using an interface probe from July 28, 1995 to December 18, 1995. Free product was removed from

MW-4 using a bailer between July 28, 1995 and December 18, 1995. A passive skimmer was reinstalled in MW-4 on December 18, 1995. Approximately 0.03 gallons of free product was removed from MW-4 using both the passive skimmer and a bailer on January 10, 1996 and February 20, 1996. Approximately 0.01 gallons of free product was removed from MW-4 by bailing on May 24, 1996.

Clayton installed a passive skimmer in monitoring well MW-6 on July 24, 1995 in response to free product encountered in MW-6 during quarterly groundwater sampling activities. The recovered free product was collected and transferred to a secondarily contained storage drum on a bi-monthly basis from July 28, 1995 through September 28, 1995, on a monthly basis from November 10, 1995 through February 20, 1996, and again on May 24, 1996. Additional free product was removed from MW-6 using a bailer after the skimmer was removed during each product recovery event. The volume of free product recovered from MW-6 has varied between 0.03 to 0.10 gallons during each product recovery event.

A summary of skimmer operations and free product removal at MW-4 and MW-6 is presented in Appendix A.

### **3.0 FIELD ACTIVITIES**

Monitoring wells MW-1 through MW-6 were purged using a 2-inch disposable bailer on May 24, 1996. Approximately four times the volume of each well was purged to ensure that water representative of the aquifer was present in each well prior to sampling. Well volumes were calculated using depth to groundwater and total well depth measurements which were recorded to the nearest 0.01 foot upon arrival at the site. Purging of monitoring wells MW-1 through MW-6 continued until pH, temperature, and electrical conductivity stabilized.

The following parameters were noted during the sampling activities:

- Monitoring well identification
- Static water level
- Well depth
- Condition of water before purging (e.g., amount of free product)
- Dissolved oxygen
- Purge rate and volume
- pH, temperature, and conductivity during purging
- Time purged
- Time of sample collection
- Sampling method
- Name of sampler
- Climatic conditions

The groundwater samples were collected using new disposable bailers. All other sampling equipment which came into contact with groundwater was thoroughly cleaned and decontaminated before use at the site. Details of the groundwater sampling event are provided in the water sampling field survey forms (Appendix B).

Groundwater samples were obtained using new bailers and were transferred into clean laboratory-supplied containers that were closed, labeled, placed immediately into an ice chest, and transported to Curtis & Tompkins, a state-certified laboratory, for analysis.

Groundwater samples were collected in such a manner as to minimize volatilization due to agitation and/or transfer from bailer to sample container. To document and trace samples from time of collection to final analysis, signed chain-of-custody records were completed by SCI personnel. The chain-of-custody records accompanied the groundwater samples to the laboratory. The completed chain-of-custody records are included with the analytical report from the laboratory (Appendix C).

#### **4.0 ANALYTICAL RESULTS**

The groundwater samples from wells MW-1 through MW-6 were analyzed using the following Environmental Protection Agency Analytical Methods:

- Method 8015 (modified) for TPH-D and TPH-motor oil
- Method 8015 (modified) for TPH-G
- Method 8020 for BTEX

The analytical results are summarized in Table 1. The laboratory analytical report for the current groundwater sampling event is included in Appendix C.

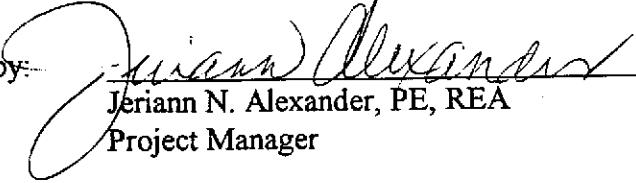

#### **5.0 FINDINGS**

Based on the laboratory analytical reports and SCI's field observations, our findings are as follows:

- Free product was observed in monitoring wells MW-4 and MW-6 after bailing.
- A sheen was observed in monitoring well MW-5 during this groundwater sampling event.
- Concentrations of TPH-D and TPH-motor oil were detected in groundwater samples collected from all monitoring wells.
- TPH-G was detected in groundwater samples collected from MW-4, MW-5 and MW-6.
- Concentrations of benzene, ethylbenzene, and total xylenes were detected in groundwater samples collected from MW-4.

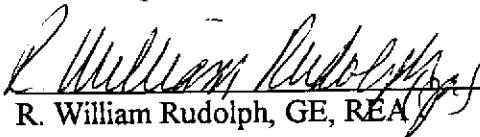

The next quarterly sampling event is scheduled for August 1996.

FP = Free product

TPH = Total petroleum hydrocarbons

NA = Not applicable

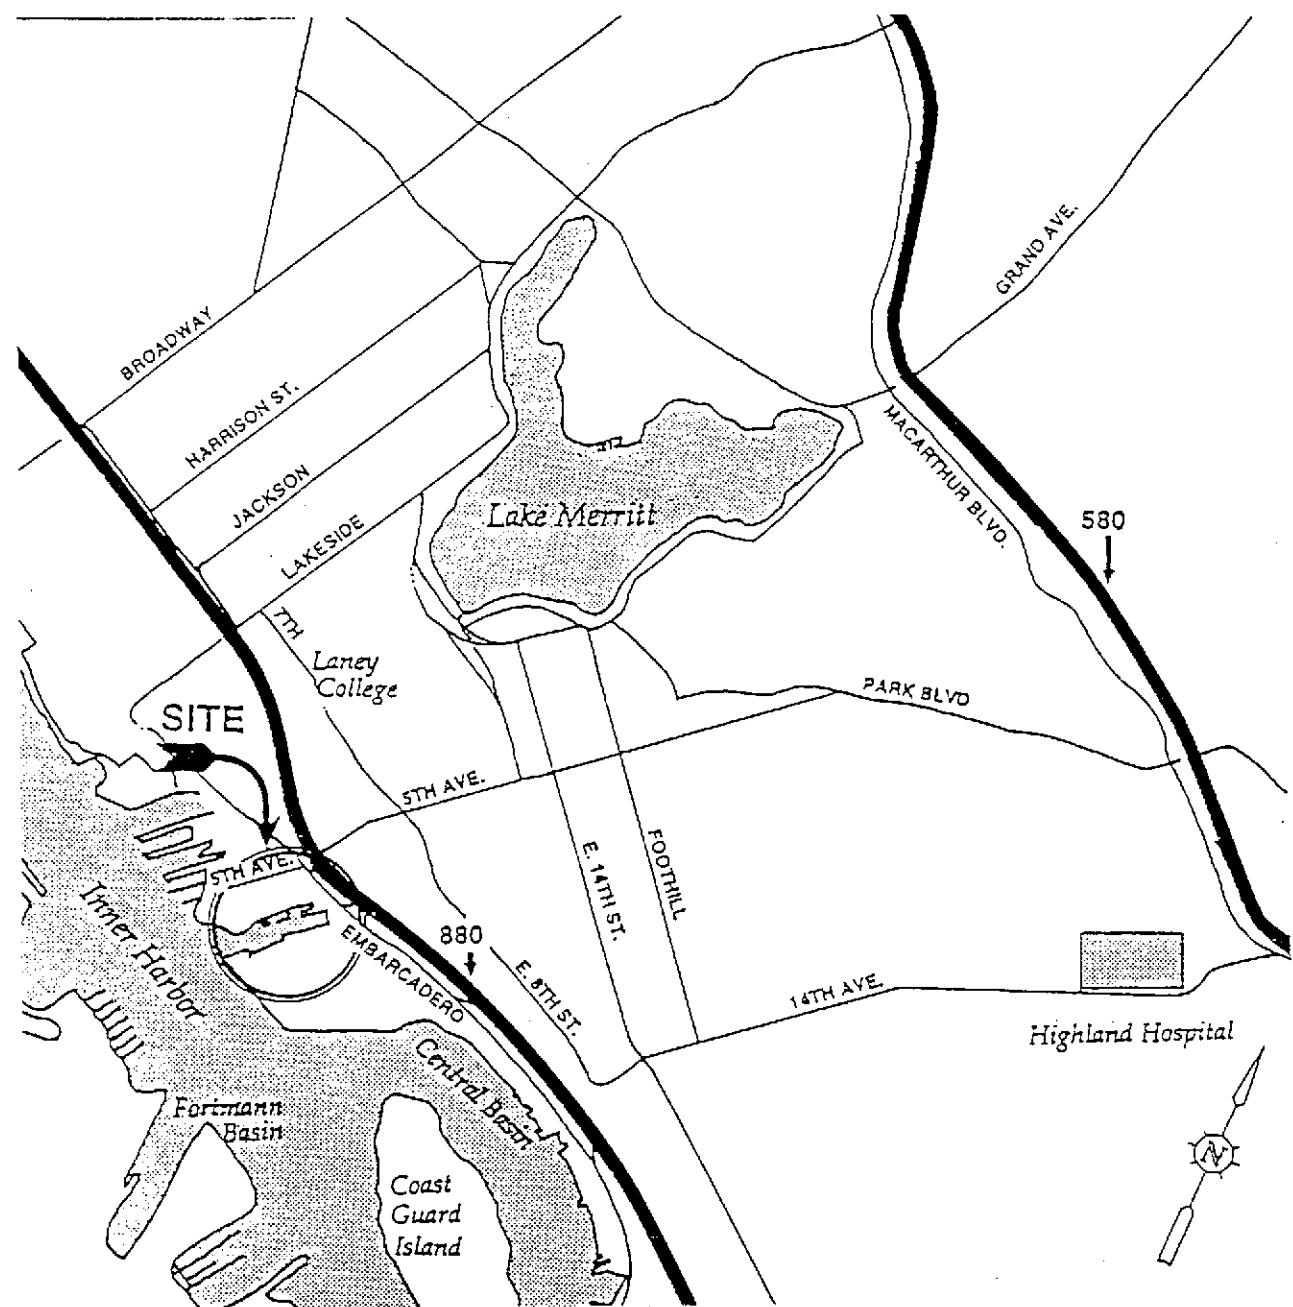

NM = Not measured

NS = Not sampled

ug/L = Micrograms per liter

Notes:

- a. Elevations are based on the Port of Oakland Datum. Elevations based on this special datum may be converted to the mean sea level datum by subtracting 3.20 feet. The top of casing elevation was resurveyed in May 1996. Groundwater elevations recorded during 1996 are calculated using the new top of casing elevation.
- b. Laboratory analysis reporting limits are listed above if the reporting limits were previously reported in data provided to Subsurface Consultants, Inc.
