**Re: Former Chevron Service Station #9-0019
210 Grand Avenue
Oakland, California**

Dear Ms. Eberle:

Enclosed is the Soil Excavation Sampling Report, that was prepared by our consultant Touchstone Developments for the above noted facility. This report documents the soil excavation and remediation at areas where hydrocarbon impacted soil was discovered during the installation of a new storm drain line by contractors Gallagher & Burk, Inc.

Excavation of the hydrocarbon impacted soil was performed by Henderson Construction, with a representative of Touchstone Developments on the site to observe the excavation activities and collect soil samples from the excavation and the soil stockpiles. An excavation was made down to and around a portion of the existing storm drain line and the excavation then continued toward the area where the new yard catch basin would be installed. The excavation was approximately 36 feet long by 18 feet wide and to a depth of 9 1/2 feet.

The excavation continued until the heavily hydrocarbon impacted soil was removed and to insure that there would be no dermal contact to any construction workers from the impacted soil, when the new underground storm drain line was installed. This can be seen by the concentration of constituents detected in the soil stockpile samples (Table A). The remaining minimal hydrocarbon constituents will naturally attenuate over time.

The samples in the excavation and the soil stockpile were analyzed for TPH-g and BTEX constituents, but with the soil stockpile also analyzed for lead. The soil stockpile of approximately 325 tons was transported by Allwaste Transportation & Remediation to Browning -Ferris Ind. landfill in Keller Canyon. Copies of the soil manifests are included for your files. The excavation was then backfilled and compacted with clean imported material.

If you have any questions, call me at (510) 842-9136.

Sincerely,
CHEVRON PRODUCTS COMPANY

TOUCHSTONE DEVELOPMENTS

Jeff L. Monroe/Project Manager

January 31, 1997

INTRODUCTION

This report prepared by Touchstone Developments (Touchstone) documents soil excavation and remediation activities performed at former Chevron Station No. 9-0019 located at 210 Grand Avenue, Oakland, California (Figure 1). Remedial efforts were directed at areas where soil contamination was suspected and discovered when Gallagher & Burk, Inc. contractors were digging a new storm drain line for a new parking lot and improvements.

SITE ACTIVITIES

Soil remediation involved the excavation and removal of suspected hydrocarbon contaminated soil in the vicinity northwest of the former fuel underground storage tanks (USTs). Excavation activities were performed by Henderson Construction of Stockton, California and a representative from Touchstone was on site to observe excavation activities and to collect soil samples from the excavation and associated stockpiles. Jennifer Eberle from Alameda County Health Agency (ACHA) was present to observe most of the excavation sampling activities. Also present was Phil Briggs representing Chevron Products Company.

Soil Sampling

Verification soil samples were collected from the excavation bottom and sidewalls at various depths. Soil samples were collected from the excavator bucket by removing the top few inches of soil and pushing a clean, six-inch-long (Two inches in diameter) brass sample tube into the soil until completely full. The ends of the tubes were covered with aluminum foil and sealed with plastic end caps. The samples were then labeled, placed in a cooler with ice, entered on a Chain-of-Custody form and transported to Sequoia Analytical, Inc., a State-certified Laboratory located in Walnut Creek, California.

Four discrete stockpile samples were collected for approximately every 100 cubic yards of soil generated. The four samples were then composited in the laboratory and analyzed as one. These samples were collected by removing the top 10 to 14 inches of soil, then pushing a sample tube into the soil stockpile until completely full. The samples were sealed, labeled and handled as previously described.

Soil samples collected from the excavation and associated stockpiles were analyzed for Total Petroleum Hydrocarbons

(TPH) calculated as gasoline according to EPA Method 8015 (Modified), Benzene, Toluene, Ethylbenzene and Xylenes (BTEX) according to EPA Method 8020. Stockpiles were additionally analyzed for Lead according to EPA Method 6010. Sample depths and analytical summaries are found in Table A. Copies of the analytical laboratory reports and Chain-of-Custody forms are presented in Appendix A.

Soil Excavation

The excavation in the vicinity of storm drain line and former USTs was performed from November 14, 1996. The final excavation was approximately 36 feet long by 18 feet at the widest location and 9 1/2 feet in depth. Soil samples designated OX1 through OX4 were collected from the excavation sidewalls at approximately 4 1/2 to 8 feet below grade surface (bgs). Sample OXB was collected from the bottom center of the excavation at approximately 9 1/2 feet bgs. Excavation and sample locations are found on Figure 2. Sample depths and chemical analytical summaries are in Table A.

Stockpile Remediation

The soil stockpile samples were designated SP-1(a-d) and SP-2(a-d) and represent approximately 200 cubic yards of soil. Upon receipt of analytical data, soils were transported for disposal by Allwaste Transportation and Remediation (Allwaste) to Browning-Ferris Industries (BFI) located in Livermore, California on November 15 and 16, 1996.

EXCAVATION COMPLETION

Upon excavation completion, clean imported material was used to backfill the excavation.

If you have questions, please call me at (707) 538-8818.
