

PHONE LOG

Date: January 29, 2015 2:00 pm

Phone call with Bryan Fong of Conestoga-Rovers & Associates. We discussed data gaps for the site and how to address them. The following conditions were discussed as possible data gaps:

- The potential for an unknown shallow source such as an unknown tank. Four tanks were removed but five tanks were suspected.
- Vertical delineation.
- Cross gradient delineation to the north.
- Naphthalene data
- Soil vapor probes may still be in place.
- There is significant variability in groundwater data, particularly from well MW-2 and MW-6.

The following scope of work was discussed in order to move the site towards case closure:

- Subslab vapor samples in the area of suspected tank 5.
- Research on the location of tank 5.
- Sampling of the soil vapor probes if they still exist.
- CRA is not planning to propose cross gradient delineation to the north. Jerry Wickham will review this condition in greater detail at the time of work plan review.

Jerry Wickham
