1.0 INTRODUCTION

This report outlines the methods and findings of Aqua Science Engineer's, Inc. (ASE) quarterly groundwater sampling at the Romak Iron Works property located at 3250 Hollis Street in Oakland, California (*Figures 1 and 2*).

2.0 GROUNDWATER SAMPLING

On November 14, 1994, ASE measured the depth to water in the site monitoring well using an electric water level sounder. The well was also checked for the presence of free-floating hydrocarbons. The well contained a hydrocarbon sheen. The well was then purged of four well casing volumes of groundwater using a pre-cleaned PVC bailer. The samples were collected from the well with a dedicated polyethylene bailer. The groundwater samples were decanted from the bailer into three (3) 40-ml volatile organic analysis (VOA) vials and three (3) 1-liter amber glass bottles. The samples were preserved with hydrochloric acid, labeled, placed in protective foam sleeves, and placed into an ice chest containing wet ice for transport to American Environmental Network (AEN) of Pleasant Hill, California (DOHS #1172) under chain of custody.

Well sampling purge water was contained in DOT 17H drums and stored on-site for handling by the client at a later date. See Appendix B for a copy of the well sample field log.

3.0 ANALYTICAL RESULTS FOR GROUNDWATER

The groundwater samples were analyzed by AEN for total petroleum hydrocarbons as gasoline (TPH-G) by EPA Method 5030/8015, total petroleum hydrocarbons as diesel (TPH-D) by EPA Method 3510/8015, benzene, toluene, ethylbenzene and total xylenes (BTEX) by EPA Method 8020 and total and hydrocarbon oil and grease (O&G) by EPA Method 5520B&F. The analytical results are tabulated below in Tables One and Two, and the certified analytical report and chain of custody form are included in Appendix A.

TPH-G was detected in the groundwater sample at 20,000 parts per billion (ppb), and BTEX was detected between 25 and 4,200 ppb. The benzene concentration of 4,200 ppb exceeded the California EPA Department of Toxic Substances Control (DTSC) maximum contaminant level (MCL) for drinking water of 1 ppb, and the ethylbenzene concentration of 860 ppb exceeded the DTSC MCL of 680 ppb. The analytical results from this

quarter are consistent with the previous quarters results. TPH-D and O&G were analyzed for the first time to determine the nature of the black substance that was found floating on the groundwater surface during previous sampling periods. 4,200 ppb TPH-D were detected in the sample and 4,000 ppb total O&G were detected but determined not to be hydrocarbon based O&G. It is still unknown what the black substance was.

TABLE ONE
Summary of Chemical Analysis of GROUNDWATER Samples
TPH-G and BTEX
 All results are in parts per billion

Sampling Date	TPH Gasoline	TPH Diesel	Benzene	Toluene	Ethyl Benzene	Total Xylenes
08-04-93	12,000	---	7.6	9.7	9.9	29
11-18-93	10,270	---	3,169	38.3	661.2	659.4
02-09-94	17,000	---	6,200	64	770	420
05-25-94	24,000	---	6,200	27	1,100	210
08-18-94	22,000	---	5,000	10	740	150
11-14-94	20,000	4,200	4,200	25	860	450
DTSC MCL		Not Established	1.0	100*	680	1,750
EPA METHOD		5030/ 8015	602 or 8020	602 or 8020	602 or 8020	602 or 8020

--- = Not analyzed

DTSC = California EPA Department of Toxic Substance Control

MCL = maximum contaminant level for drinking water

* = DTSC recommended action level for drinking water; MCL not established

TABLE TWO
Summary of Chemical Analysis of GROUNDWATER Samples
Oil and Grease
 All results are in parts per billion

Sampling Date	Total Oil & Grease	Hydrocarbon Oil & Grease
11-14-94	4,000	<1,000
EPA METHOD	5520B	5520F

4.0 CONCLUSIONS AND RECOMMENDATIONS

Relatively high TPH-G, TPH-D, benzene and ethylbenzene concentrations (20,000 ppb, 4,200 ppb, 4,200 ppb and 860 ppb, respectively) were detected in groundwater samples collected from monitoring well MW-1. These concentrations are consistent with previous quarter's results.

Future plans for this site include determining the groundwater gradient and flow direction beneath the site utilizing wells at other surrounding sites, and installing one (1) well downgradient of the site.

5.0 REPORT LIMITATIONS

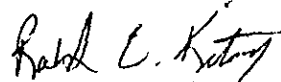

The results of this investigation represent conditions at the time of the groundwater sampling, at the specific locations at which the samples were collected, and for the specific parameters analyzed for by the laboratory.

It does not fully characterize the site for contamination resulting from unknown sources, or for parameters not analyzed for by the laboratory. All of the laboratory work cited in this report was prepared under the direction of an independent CSDHS certified laboratory. The independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

Aqua Science Engineers appreciates the opportunity to assist Romak Iron Works with its environmental needs. Should you have any questions or comments, please feel free to call us at (510) 820-9391.

Respectfully submitted,

AQUA SCIENCE ENGINEERS, INC.

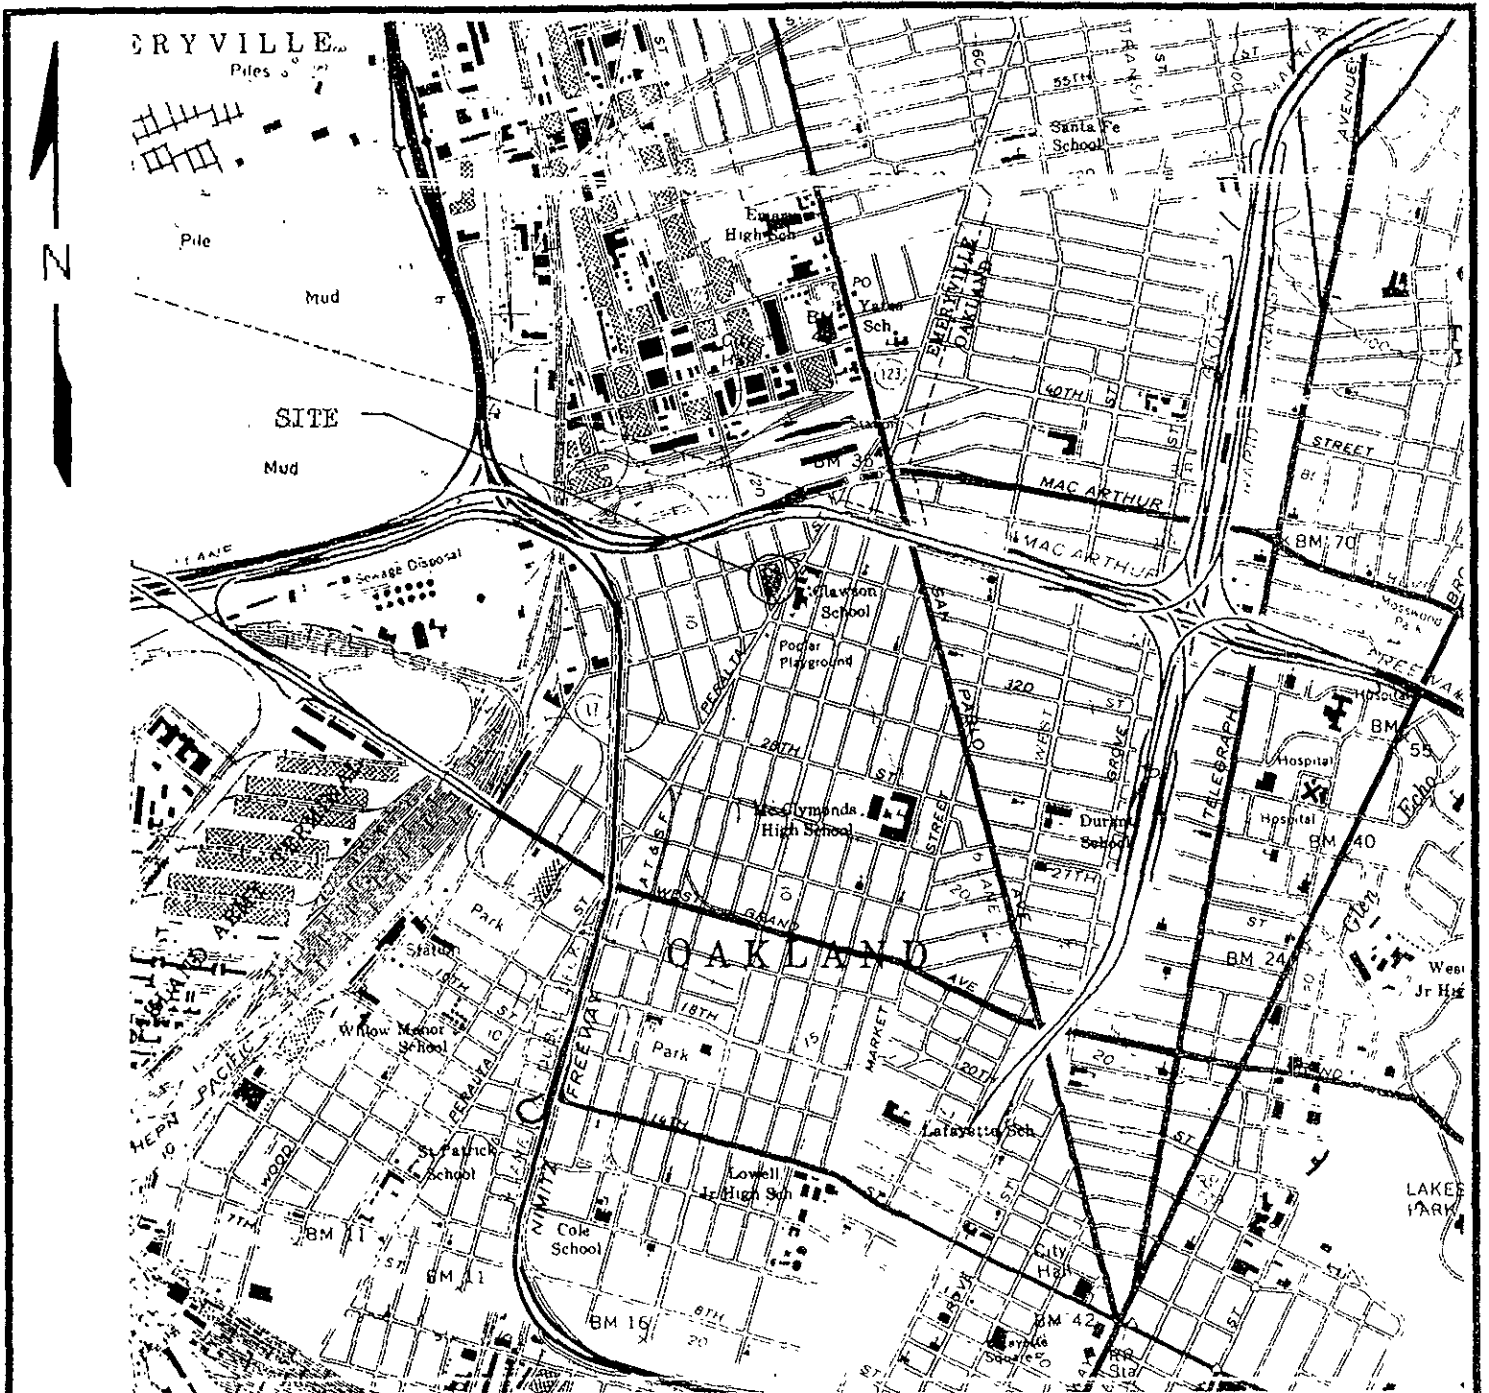

Robert E. Kitay, R.E.A.
Project Geologist

QUALITY CONTROL REPORT

AEN JOB NUMBER: 9411196

CLIENT PROJECT ID: 2659

Quality Control and Project Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

Well Sampling Field Log

WELL SAMPLING FIELD LOG

Project Name and Address: Romak Iron Works, Oakland, CA
 Job #: 2659 Date of sampling: 11-14-97
 Well Name: MW-1 Sampled by: JK
 Total depth of well (feet): 21.65 Well diameter (inches): 2
 Depth to water before sampling (feet): 12.54
 Thickness of floating product if any: shun
 Depth of well casing in water (feet): 9.11
 Number of gallons per well casing volume (gallons): 1.5
 Number of well casing volumes to be removed: 4
 Req'd volume of groundwater to be purged before sampling (gallons): 6
 Equipment used to purge the well: Dedicated polyethylene bailer
 Time Evacuation Began: 11:25 Time Evacuation Finished: 11:50
 Approximate volume of groundwater purged: ~~1.5~~^{pk} 6 gallons
 Did the well go dry?: No After how many gallons: -
 Time samples were collected: 12:00
 Depth to water at time of sampling: -
 Percent recovery at time of sampling: -
 Samples collected with: Dedicated polyethylene bailer
 Sample color: None (clear) Odor: very strong
 Description of sediment in sample: None
