Interim Remedial Action Report

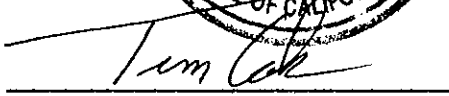

**Himalaya Trading Company
2951 High Street
Oakland, CA 94619**

**W.A. Craig, Inc., Project No. 3936
December 7, 2001**

This document has been prepared by the staff of W. A. Craig, Inc., under the professional supervision of the persons whose seals and signatures appear hereon. No warranty, either expressed or implied, is made as to the professional advice presented herein. The analysis, conclusions and recommendations contained in this document are based upon site conditions as they existed at the time of the investigation and they are subject to change.

The conclusions presented in this document are professional opinions based solely upon visual observations of the site and vicinity, and interpretation of available information as described in this report. W.A. Craig, Inc., recognizes that the limited scope of services performed in execution of this investigation may not be appropriate to satisfy the needs, or requirements of other state agencies, or of other users. Any use or reuse of this document or its findings, conclusions or recommendations presented herein is at the sole risk of said user.

Tim D. Cook, P.E.
Principal Engineer

INTRODUCTION

Site Location and Description

The Site is located at 2951 High Street, in Oakland, California (**Figure 1**) and is located at the base of the Oakland Hills. The Site topography runs southerly toward High Street. Regionally, the topography slopes westerly toward San Francisco Bay. Site soils are primarily clayey silt, sandy silt, and silty sand with minor amounts of gravelly sand. Groundwater occurs at approximately 21 feet below grade (fbg) in monitoring wells MW-5 and MW-6 located on Site. Potentiometric surface maps for this Site have generally shown groundwater flow to the southeast (ASE, November 14, 2000). Site structures and other features are indicated on **Figure 2**.

Objectives

The objectives of this soil remediation by source removal was to abate soils with concentrations greater than the Site Specific Threshold Levels (SSTLs) established in a Tier 2 Risk Based Corrective Action computer model (Palmer, August 22, 1997).

Background

Onsite monitoring wells MW-1, MW-3, and MW-6 have consistently yielded non-detectable concentrations of petroleum hydrocarbon constituents. Between May 28 and June 24, 1997, 2,550 pounds of ORC slurry was injected into borings along the northern and eastern side of the old underground storage tanks (UST) to promote aerobic biodegradation of petroleum hydrocarbons dissolved in groundwater. On August 21, 1998, ORC socks were installed in wells MW-4 and MW-5 (ASE, November 14, 2000). The location of the former USTs, new USTs and the six monitoring wells are shown on **Figure 2**.

W.A. Craig, Inc (WAC) collected six soil samples from a pipe trench located on the south side of the property in the vicinity of pump dispensers on February 28, 2001. High concentrations of petroleum hydrocarbons were detected in six soil samples collected from this area (W.A. Craig, March 9, 2001). Soil sample results from this sampling event are summarized in **Table 1**.

WAC met with Mr. Hernan Gomez of the City of Oakland Fire Services Agency and Mr. Amir Gholami of the Alameda County Health Care Services, Hazardous Materials Division (ACHCS) on March 19, 2001 to discuss the approach to corrective action. The regulatory agencies requested submittal of this Site Investigative Work Plan prior to implementing remediation of contaminated soil.

A *Site Investigation Workplan* dated March 26, 2001 recommending soil and groundwater investigation was submitted to the ACHCS. The workplan was approved in a letter from the ACHCS dated March 29, 2001. The workplan approval letter also requested the removal of the four existing USTs along with over-excavation of the contaminated soils as significant and necessary to expedite the clean up process.

Six additional soil borings were advanced on April 26, 2001. Soil samples were collected from 5 feet and 10 feet below grade (fbg). A grab groundwater sample was also collected from borings where groundwater was encountered.

Soil and groundwater sample results were compared to Site Specific Threshold Levels (SSTLs) established in the *Addendum to Risk Assessment for Zima Center Corporation, 2951 High Street, Oakland, August 22, 1997*. In addition to the SSTLs previously established in the risk assessment, we propose to use a SSTL of 100 mg/kg for TPH-g. This cleanup level was established by the San Francisco Bay Regional Water Quality Control Board (RWQCB) for surface soils (≤ 3 m fbg) where groundwater is a current or potential source of drinking water (RWQCB, 2000).

Based on field observations and the laboratory results, there had been an uncontrolled release of petroleum hydrocarbons from the pump dispenser area in front of the store. Groundwater samples from borings TB-1 and TB-3 yielded MtBE, benzene, toluene, ethylbenzene and xylenes significantly in excess of the SSTLs.

On May 16, 2001 two 6,000-gallon gasoline (Tank 1 and 4) and one 4,000-gallon gasoline (Tank 2) underground fuel storage tanks (USTs) were removed from the Site. An additional 4,000-gallon gasoline UST (Tank 3) was removed on May 17, 2001. The locations of the USTs, sampling locations and other physical features are depicted on **Figure 3**. Approximately 1,000 gallons of fuel were removed and disposed of by Alviso Independent Oil. The tanks were rinsed and ventilated before being removed. The steel tanks were transported by W. A. Craig, Inc. (WAC) of Dixon, California. The tanks were destroyed and disposed of as non-hazardous solid waste at SimsMetal America in Richmond, California. Details of the UST removal are presented in the *Final Closure Report For Underground Storage Tank Removal* dated September 14, 2001.

SCOPE OF WORK

The scope of services was implemented to remove Site soils containing hydrocarbons greater than the SSTLs. The work performed was approved by the ACHCS in a letter dated March 29, 2001.

The scope of work for this portion of the remedial action included the following:

- Excavated approximately 3,695 tons of contaminated soil from the site surrounding the former UST excavation on the dispenser island;
- Loaded, hauled and disposed of stockpiled soil to Class II landfill;
- Collected verification soil samples from the UST excavation;
- Analyzed soil samples for TPH-g, BTEX, and MtBE;

- Loaded, hauled and compacted clean fill into the excavation; and
- Prepared this *Interim Remedial Action Report*.

UST PIT SAMPLING

Soil Excavation and Soil Samples

WAC excavated contaminated soil from the Site in several phases from May 9, 2001 through September 27, 2001. Approximately 3,695 tons of petroleum hydrocarbon contaminated soil was excavated, hauled and disposed of at B&J landfill, a Class II landfill, in Vacaville, California. Soil was excavated in areas where the soil sample analytical, photo-ionization detector screening, visual and olfactory observation suggested hydrocarbon contamination above the SSTLs. A summary of the amounts disposed, date of disposal, and the soil tags for each truckload are included in **Appendix A**.

Soil samples were collected along the excavation sidewalls and the pit bottom from the bucket of the excavator. Brass tubes were driven into native soil from the excavator bucket using a wooden mallet. The ends of the brass tubes were completely covered with Teflon sheets and end caps placed such that an airtight seal was maintained. Figures depicting daily excavation and sampling locations are included in **Appendix B**.

Soil samples selected for analysis were labeled indicating project number, sample number, sample depth, date, and collection time. The same information was recorded on the chain of custody form. Soil samples were placed in a cooler with ice. The sample cooler was delivered to the analytical laboratory under chain-of-custody protocol within 24 hours of collection. Soil samples were analyzed for total petroleum hydrocarbons as gasoline (TPH-g) by EPA Method 8015 (modified), benzene, toluene, ethylbenzene and xylenes (BTEX) and methyl tertiary butyl ether (MtBE) by EPA Method 8020. A summary of soil samples collected during this interim remediation is presented in **Table 2**. Laboratory analytical reports are presented in **Appendix C**.

CONCLUSIONS AND RECOMMENDATIONS

Residual concentrations of gasoline hydrocarbons remain in soil samples collected from the sidewall of the excavation in certain areas. It is not feasible to excavate this soil along the foundations of the canopy on the eastern edge of the excavation and the building on the southern edge of the excavation since the structures could be undermined by further excavation. Excavation along Penniman and High Streets would undermine the sidewalk therefore further soil excavation is not warranted. The majority of the contaminant mass was removed. Additional investigation is recommended to assess the impact of hydrocarbon contamination to shallow groundwater.

A Sensitive Receptor Survey (SRS) is recommended to identify and evaluate the potential for contamination of surface and groundwater aquifers in the area.

Lead*

EPA analytical methods 6010/200.7, 239.2*

Lab ID	Client ID	Matrix	Extraction °	Lead*	% Recovery Surrogate
69473	SP-1-4	S	TTLC	7.5	99
69474	SP-4-8	S	TTLC	ND	92
69475	SP-9-12	S	TTLC	3.2	100
Reporting Limit unless otherwise stated; ND means not detected above the reporting limit		S	TTLC	3.0 mg/kg	
		W	TTLC	0.005 mg/l.	
		---	STLC,TCLP	0.2 mg/L	

* soil and sludge samples are reported in mg/kg, wipe samples in ug/wipe, and water samples and all STLC / SPLP / TCLP extracts in mg/l.
 °Lead is analysed using EPA method 6010 (ICP)for soils, sludges, STLC & TCLP extracts and method 239.2 (AA Furnace) for water samples
 § DISTLC° extractions are performed using STLC methodology except that deionized water is substituted for citric acid buffer as the extraction fluid. DISTLC results are not applicable to STLC regulatory limits.
 ° EPA extraction methods 1311(TCLP), 3010/3020(water,TTLC), 3040(organic matrices,TTLC), 3050(solids,TTLC); STLC - CA Title 22
 * surrogate diluted out of range; N/A means surrogate not applicable to this analysis
 * reporting limit raised due matrix interference
 i) liquid sample that contains greater than ~2 vol. % sediment; this sediment is extracted with the liquid, in accordance with EPA methodologies and can significantly effect reported metal concentrations.

Reporting Limit unless otherwise stated; ND means not detected above the reporting limit	W		50 ug/L	5.0	0.5	0.5	0.5	0.5	
	S		1.0 mg/kg	0.05	0.005	0.005	0.005	0.005	

* water and vapor samples are reported in ug/L, wipe samples in ug/wipe, soil and sludge samples in mg/kg, and all TCLP and SPLP extracts in ug/L

* cluttered chromatogram; sample peak coelutes with surrogate peak

*The following descriptions of the TPH chromatogram are cursory in nature and McCampbell Analytical is not responsible for their interpretation: a) unmodified or weakly modified gasoline is significant; b) heavier gasoline range compounds are significant(aged gasoline?); c) lighter gasoline range compounds (the most mobile fraction) are significant; d) gasoline range compounds having broad chromatographic peaks are significant; biologically altered gasoline?; e) TPH pattern that does not appear to be derived from gasoline (?); f) one to a few isolated peaks present; g) strongly aged gasoline or diesel range compounds are significant; h) lighter than water immiscible sheen is present; i) liquid sample that contains greater than ~5 vol. % sediment; j) no recognizable pattern.

$$\% \text{ Recovery} = \frac{(MS - \text{Sample})}{\text{Amount Spiked}} \cdot 100$$

$$RPD = \frac{(MS - MSD)}{(MS + MSD)} \cdot 2 \cdot 100$$

RPD means Relative Percent Deviation
