Dear Mr. Detterman:

On behalf of our clients, Jasminder and Sonia Sikand, Aqua Science Engineers, Inc. (ASE) is pleased to submit this report detailing the operation of the ozone-sparging remediation equipment at the subject site. This report also includes current groundwater monitoring well analytical results.

Should you require any additional information, please feel free to call me at (925) 820-9391.

Respectfully submitted,

AQUA SCIENCE ENGINEERS, INC.

1.0 INTRODUCTION

This report details Aqua Science Engineers, Inc. (ASE) operation of the ozone-sparging remediation system at the Albany Hill Mini Mart property located at 800 San Pablo Avenue in Albany, California (Figure 1) since January 2010. This report also provides current groundwater concentrations in the site's on and off-site groundwater monitoring wells.

2.0 WEEKLY OPERATION AND MAINTENANCE ACTIVITIES

ASE personnel visits the site on a regular basis to maintain and optimize the remediation equipment. During most visits, ASE personnel complete the following:

- Inspect the system, check for alarms, perform maintenance as necessary,
- Measure and record the ozone level within the two vapor-monitoring points (VMPs) to ensure no detection of ozone in the sub-slab area beneath the site,
- Inspect the ozone-sparging well heads for leaks or integrity failures,
- Inspect site security fencing,

3.0 REMEDIATION SYSTEM OPERATION

3.1 Ozone-Sparging Remediation System Operation Mode

Since January 2010, the ozone-sparging remediation equipment has operated in "high-flow ozone" mode into each of the nine sparging wells that are located on-site (Figure 2). The system has maintained a 99% operation efficiency; downtime for the ozone-sparging system has only occurred for maintenance purposes and an occasional overhauling of the compressor, valves, and ozone-generating cells. The system has been maintained by ASE personnel and H2O Engineering of San Luis Obispo, California (12-month maintenance program). A log showing the operation mode is attached in Appendix A.

3.2 Ozone Generator

The remediation equipment consists of an Ozone Sparge Unit manufactured by H2O Engineering of San Luis Obispo, California. The unit model number is an H2O-OSU20-26 capable of an ozone output of 26 grams/hour at up to 6% by weight. The H2O-OSU20-26 is a compact unit that generates an air/ozone mixture on-site. The unit pumps the air/ozone mixture through nine ports, one port at a time, on a cycle set by a timer. The air/ozone flow is approximately 3 to 4 cubic feet per minute (cfm) at a pressure of approximately 20 pounds per square inch (psi). Each sparge point receives ozone in 30 minutes intervals approximately 5 times per day for a total of 150 minutes per well/day.

3.3 Manifold System

The air/ozone mixture is pumped through double contained ozone-resistant Teflon tubing from the H2O-OSU20-26 unit to the sparging wells. This tubing consists of a 1/2-inch diameter inner transport tubing within a 1-inch schedule 40 PVC secondary-containment tube. This tubing is flexible and is buried through narrow trenches cut through the concrete surface.

(925) 820-9391 - Fax (925) 837-4853 - www.aquascienceengineers.com

3.4 Remediation Equipment Operation & Maintenance

The ozone-sparging system operates continuously 24-hours a day, 7 days a week. The system is checked weekly by ASE personnel. The presence of ozone is measured at the remediation system and within each well box to determine if any leaks had occurred – no leaks have been identified. The presence of ozone is also measured within the buildings on and off-site as well as within each VMP – no ozone detections have been identified. The system uses an internal ozone detector to measure for ozone within the remediation equipment housing. Should ozone be detected, the on-board microprocessor shuts the ozone off to whichever well is sparging during the ozone detection. When this occurs, the affected well remains in use; however, until the problem is remedied, the well is only sparged with compressed air rather than air/ozone mixture. The same goes for any high pressure situations. Should a particular well require an injection pressure of 50 psi or greater for more than 30 seconds, the on-board microprocessor shuts delivery of ozone to the affected well. The affected well will remain off until the alarm is cleared and the problem causing the high pressure is repaired. Various internal ozone detections and high-pressure alarms have occurred since the last report; however, the alarms have been few in numbers and significant repairs have not been required. ASE personnel periodically changes compressor filters, in-line moisture-removal filters, various fuses, and compressor parts (capacitors, relays, fan blades and piston seals) in order to maintain the system's continuous operation. 12-month system rebuild kits that include replacement of check valves, ozone-sensors, valve stems, compressor parts, fuses and relays) are performed by H2O Engineering personnel, with the last one occurring in early October 2013.

4.0 GROUNDWATER MONITORING WELL SAMPLE COLLECTION

4.1 Water levels, Free-Product Thickness, and Flow Direction

On September 30, 2013, ASE measured the depth to water in monitoring wells MW-1 through MW-10 using an electric water level sounder. The surface of the groundwater was also checked for the presence of free-floating hydrocarbons or sheen. No free floating hydrocarbons were present in any of the wells. Groundwater elevation data is presented in Table One.

A groundwater elevation (potentiometric surface) contour map is shown as Figure 3. The groundwater flow direction at the site varies due to the ozone-sparging activities. During this sampling event, groundwater was determined to flow to the north/northeast with an inconsistent gradient.

4.2 Groundwater Sample Collection

On September 30, 2013, ASE collected groundwater samples from all monitoring wells for analysis. Prior to sampling, the wells were purged of three well casing volumes of groundwater using disposable polyethylene bailers. The exception to this is monitoring well MW-9, which went dry after only one well-casing volume (this occurs each time this well is sampled). Monitoring well MW-9 was sampled after allowing for recovery for 2 hours. The pH, temperature and conductivity of the purge water were monitored during evacuation, and samples were not collected until these parameters stabilized. Samples were collected from each well using disposable polyethylene bailers. The groundwater samples were decanted from the bottom of the bailers using low-flow emptying devices into 40-ml volatile organic analysis (VOA) vials, preserved with hydrochloric acid, sealed without headspace and labeled. All samples were stored on ice for transport to Kiff Analytical, LLC, (KIFF) of Davis, California under appropriate chain of custody documentation. Well sampling purge water was contained in a sealed and

Aqua Science Engineers, Inc. 55 Oak Court, Danville, CA 94526
(925) 820-9391 - Fax (925) 837-4853 - www.aquascienceengineers.com

labeled 55-gallon steel drum for temporary storage until off-site disposal can be arranged. See Appendix B for copies of the well sampling field logs.

4.3 Analytical Results for Groundwater Samples

All groundwater samples were analyzed by KIFF for total petroleum hydrocarbons as gasoline (TPH-G), benzene, toluene, ethylbenzene, total xylenes (collectively known as BTEX), fuel oxygenates including methyl tertiary butyl ether (MTBE), TAME and TBA by EPA Method 8260B, and TPH as diesel (TPH-D) by EPA Method 8015. The analytical results are tabulated in Table Two, and copies of the certified analytical report and chain of custody form are included in Appendix C. The groundwater analytical results are summarized below:

- Groundwater samples collected from monitoring well MW-1 contained 0.67 parts per billion (ppb) benzene and 8.1 ppb MTBE. These concentrations are very similar to the previous sampling event, are significantly lower than concentrations from prior to the start-up of the ozone-sparging system, and show a steady decreasing trend of hydrocarbons in this well. The current MTBE concentration is at a historic low.
- No hydrocarbons or oxygenates were detected in groundwater samples collected from monitoring well MW-2. This is the 11th straight sampling event where no hydrocarbons or oxygenates were detected in groundwater samples collected from monitoring well MW-2.
- No hydrocarbons or oxygenates were detected in groundwater samples collected from monitoring well MW-3. This is the 4th straight sampling event where no hydrocarbons or oxygenates were detected in groundwater samples collected from monitoring well MW-3. MTBE, in particular is significantly lower than concentrations from prior to the start-up of the ozone-sparging system.
- Groundwater samples collected from monitoring well MW-4 contained 130 ppb TPH-G, 17 ppb benzene, 8.8 ppb MTBE, and 0.63 ppb DIPE. These concentrations are similar to previous sampling events and continue to represent a significant decrease of up to several orders of magnitude from pre-remediation conditions.
- Groundwater samples collected from monitoring well MW-5R contained 2,000 ppb TPH-G, 13 ppb benzene, 0.97 ppb toluene, 5.1 ppb ethylbenzene, and 0.82 ppb xylenes. These concentrations are similar to the previous sampling event (benzene increased slightly). No oxygenates were detected.
- Groundwater samples collected from monitoring well MW-6 contained 300 ppb TPH-G and 850 ppb TPH-D. It should be noted that the TPH-D results are atypical for diesel fuel. No BTEX or oxygenates were detected for the second consecutive sampling event.
- No hydrocarbons or oxygenates were detected in groundwater samples collected from monitoring well MW-7. This is the 4th straight sampling event where no hydrocarbons or oxygenates were detected in groundwater samples collected from monitoring well MW-7.

Aqua Science Engineers, Inc. 55 Oak Court, Danville, CA 94526
(925) 820-9391 - Fax (925) 837-4853 - www.aquascienceengineers.com

- No hydrocarbons or oxygenates were detected in groundwater samples collected from monitoring well MW-8. This is the 12th straight sampling event where no hydrocarbons or oxygenates were detected in groundwater samples collected from monitoring well MW-8.
- Groundwater samples collected from monitoring well MW-9 contained 4,200 ppb TPH-G, 69 ppb benzene, 12 ppb toluene, 170 ppb ethylbenzene, and 630 ppb xylenes. These concentrations are slightly higher than the previous sampling event, but continue to represent a slight decrease from pre-remediation conditions. No oxygenates were detected.
- The only compound detected in groundwater samples collected from monitoring well MW-10 during this sampling event was 1.4 ppb MTBE. This is similar to results from the several recent previous sampling events.

Concentrations in groundwater samples collected from the following wells exceeded Environmental Screening Levels (ESLs) for drinking water as presented in the "Screening For Environmental Concerns at Sites With Contaminated Soil and Groundwater" document prepared by the California Regional Water Quality Control Board, San Francisco Bay Region dated May 2013:

- Concentrations of TPH-G in groundwater samples collected from monitoring wells MW-4, MW-5R, MW-6, and MW-9 exceeded the ESL.
- Concentrations of benzene in groundwater samples collected from monitoring wells, MW-4, MW-5R, and MW-9 exceeded the ESL.
- Concentrations of ethylbenzene in groundwater samples collected from monitoring well MW-9 exceeded the ESL.
- Concentrations of xylenes in groundwater samples collected from monitoring well MW-9 exceeded the ESL.
- Concentrations of MTBE in groundwater samples collected from monitoring wells MW-1, and MW-4 exceeded the ESL.

TPH-G, benzene and MTBE isoconcentration maps are presented as Figures 4, 5 and 6, respectively. Graphs depicting concentrations of TPH-G, benzene, and MTBE are also included in Appendix D.

5.0 COMPARISON TO LOW-THREAT CLOSURE POLICY CRITERIA

A full evaluation on how the current site conditions compare to the California Regional Water Quality Control Board Low-Threat Closure Policy has not been made; however, ASE is currently awaiting approval of an encroachment permit from the City of Albany for a subsurface soil and soil vapor assessment to fill in data gaps. Once the permit is approved, ASE will perform the subsurface assessment, and the assessment data will be used to evaluate the site in comparison to the Low-Threat Closure Policy. ASE anticipates having a completed subsurface assessment and closure comparison report within the next 60 days.

Aqua Science Engineers, Inc. 55 Oak Court, Danville, CA 94526
(925) 820-9391 - Fax (925) 837-4853 - www.aquascienceengineers.com

6.0 RECOMMENDATIONS

- Until it is determined that the site is suitable for closure, ASE recommends continued operation of the remediation system at the site.
- Due to recent and consistent low to non-detectable concentrations, ASE recommends removing monitoring wells MW-2, MW-3, MW-7, MW-8, and MW-10 from the groundwater monitoring program.

Notes:

Data prior to September 10, 2004, including survey data, is based on tables compiled by AARS.

* Top of casing elevations were initially surveyed to an arbitrary benchmark. The elevations were resurveyed on November 11, 2002 with respect mean sea level.

| ESL | | 100 | 100 | 1.0 | 40 | 30 | 20 | NE | 12 | 5.0 | Varies |

Notes:

Data prior to August 2004 is based on a table compiled by AARS - ASE has not checked results against original laboratory reports.

* Does not match diesel pattern

** Confirmed by GC/MS method 8260

ESL = Environmental screening levels presented in the "Screening For Environmental Concerns at Sites With Contaminated Soil and Groundwater (May 2013)" document prepared by the California Regional Water Quality Control Board, San Francisco Bay Region for sites where groundwater is a current or potential source of drinking water.

Most recent concentrations are in **Bold**.

Non-detectable concentrations noted by the less than sign (<) followed by the laboratory detection limit.

NE indicates that no ESL has been established for this compound.

APPENDIX C

Certified Analytical Report
and
Chain of Custody Documentation
for
Groundwater Samples

Report Number : 86199

Date : 10/11/2013

Laboratory Results

David Allen
Aqua Science Engineers, Inc.
55 Oak Court, Suite 220
Danville, CA 94526

Subject : 10 Water Samples
Project Name : ALBANY HILL M.M.
Project Number : 3934

Dear Mr. Allen,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed. Testing procedures comply with the 2003 NELAC and TNI 2009 standards. Laboratory results relate only to the samples tested. This report may be freely reproduced in full, but may only be reproduced in part with the express permission of Kiff Analytical, LLC. Kiff Analytical, LLC is certified by the State of California under the National Environmental Laboratory Accreditation Program (NELAP), lab # 08263CA. If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

A handwritten signature in black ink that reads "Troy G. Turpen".

Troy Turpen

Subject : 10 Water Samples
Project Name : ALBANY HILL M.M.
Project Number : 3934

Case Narrative

Matrix Spike/Matrix Spike Duplicate results associated with sample MW-4 for the analyte Benzene were outside of control limits. This may indicate a bias for the sample that was spiked. Since the LCS recoveries were within control limits, no data are flagged.
