1131 Harbor Bay Parkway, Suite 250
Alameda, California 94502-6577

Subject: **StID#3337**

Site Address: 3609 International Blvd., Oakland, California

Dear Mr. Wickham:

SOMA's "First Quarter 2009 Groundwater Monitoring and Remediation System Report With Evaluation of Effectiveness of Monthly MPE" for the subject property has been uploaded to the State's GeoTracker database and Alameda County's FTP site for your review.

Thank you for your time in reviewing our report. If you have any questions or comments, please call me at (925) 734-6400.

Sincerely,

A handwritten signature in black ink, appearing to read "Mansour Sepehr".

Mansour Sepehr, Ph.D., PE

1. INTRODUCTION

SOMA Environmental Engineering, Inc. (SOMA) has prepared this monitoring and groundwater remediation report on behalf of Mr. Abolghassem Razi, owner of the property at 3609 International Boulevard at the intersection of 36th Avenue and International Boulevard in Oakland, California (Figure 1). Tony's Express Auto Service operates on the property.

This report summarizes results of the First Quarter 2009 groundwater monitoring event conducted at the site on March 24, 2009, and includes laboratory analytical results for groundwater samples.

This report also describes operation of the groundwater remediation systems composed of groundwater pump-and-treat and groundwater air sparging, and results of February 2009 multi-phase extraction (MPE) conducted at the site. Locations of groundwater remediation systems are shown in Figure 2.

1.1 Summary of Field Activities

On March 24, 2009, eight on-site monitoring wells (MW-1, MW-2, MW-3, MW-4R, MW-5 through MW-8), two off-site wells (MW-10, MW-12), three French drain risers (FD Center, FD East, and FD West), and one extraction well (EX-1) were measured for depth to groundwater.

On March 24, 2009, additional field measurements and grab groundwater samples were collected from MW-1, MW-3, MW-6, MW-8, and MW-10. Quarterly sampling of MW-2, MW-4R, MW-5, MW-7, and MW-12 and all testing for ferrous iron, nitrate, and sulfate was discontinued per directive of Alameda County Environmental Health Services (ACEHS) dated August 26, 2008. In Fourth Quarter 2008, in addition to regular purging and sampling on November 4, 2008, MW-1, MW-3, and MW-6 were purged and sampled again on November 13 for confirmation purposes.

Groundwater monitoring activities were performed in accordance with general guidelines of the California Regional Water Quality Control Board (CRWQCB) and ACEHS. A description of groundwater monitoring procedures followed is included in Appendix A. Figure 2 shows well and riser locations.

A natural attenuation study was conducted during this monitoring event to evaluate whether petroleum hydrocarbons found in the groundwater were biodegrading.

1.2 Summary of Laboratory Analysis

Curtis & Tompkins, Ltd., a California state-certified laboratory, analyzed groundwater samples for the following:

- Total petroleum hydrocarbons as gasoline (TPH-g)
- Benzene, toluene, ethylbenzene, total xylenes (BTEX)
- Methyl tertiary-butyl ether (MtBE)

Samples were prepared using EPA Method 5030 and analyzed using EPA Method 8260B.

2. RESULTS

Following are results of field measurements and laboratory analyses for the First Quarter 2009 groundwater monitoring event.

2.1 Field Measurements

As shown in Table 1, depths to groundwater for monitoring wells ranged from 8.48 feet in MW-10 to 10.44 feet in MW-1. Corresponding groundwater elevations ranged from 27.47 feet in MW-12 to 31.85 feet in MW-5. Groundwater elevations for FD Center, FD East, FD West and extraction well EX-1 were 26.57 feet, 29.48 feet, 29.50 feet, and 23.47 feet, respectively.

Figure 3 shows the groundwater elevation contour map. Groundwater flows toward extraction well EX-1 at an approximate gradient of 0.146 feet/feet. The lowest site-wide groundwater elevation was measured in EX-1. EX-1 and FD Center are providing a capture zone within the region of the UST cavity and in general have reduced off-site contaminant migration.

Field notes for physical, chemical and biodegradation parameters measured during this monitoring event are included in Appendix B.

The most energetically preferred electron acceptor for redox reactions is dissolved oxygen (DO). Evaluating distribution of electron acceptors can provide evidence of where, and to what extent, hydrocarbon biodegradation is occurring.

Upon equalization of the surrounding aquifer, when the purge cycle was terminated, DO concentrations ranged from 0.69 mg/L in MW-1 to 1.80 mg/L in MW-3. Oxidation-reduction potential (ORP) showed negative redox potentials in MW-1, MW-6, and MW-8. Oxidation of petroleum hydrocarbons could have occurred in these monitoring wells because negative redox potential indicates

that contaminants in groundwater are conducive to anaerobic biodegradation. MW-3 and MW-10 showed positive redox potential. Positive redox potentials are more energetically favorable in utilizing electron acceptors during chemical reactions. This promotes removal of organic mass from contaminated groundwater by indigenous bacteria in the subsurface during release of the transfer of electrons.

Testing for ferrous iron, nitrate, and sulfate was discontinued per ACEHS directive. Due to the extent of biodegradation data generated during quarterly monitoring events, SOMA has adequately characterized site groundwater.

2.2 Laboratory Analysis

Table 1 presents laboratory analysis results for groundwater samples collected during this monitoring event, and Appendix C contains chain of custody documentation and laboratory analytical reports.

TPH-g concentrations ranged from 76 µg/L in MW-3 to 3,400 µg/L in MW-6.

The following concentration trends were observed:

- At MW-1 in the vicinity of the UST cavity, TPH-g decreased since the previous monitoring event (Fourth Quarter 2008) and the current TPH-g concentration is significantly lower than in Fourth Quarter 2006.
- At MW-3 in the vicinity of the UST cavity, TPH-g has decreased significantly since the previous monitoring event.
- Since the previous monitoring event, TPH-g has decreased at MW-6.
- Since the previous monitoring event, TPH-g has increased in MW-8.
- Since the previous monitoring event, TPH-g has increased in off-site well MW-10.

Refer to Table 1 for detailed TPH-g site concentration trends.

Figure 4 displays the contour map of TPH-g concentrations in groundwater. The highest TPH-g concentrations were detected in the vicinity of the pump islands at MW-6.

The following BTEX concentration trends were observed during this monitoring event:

- In MW-3, toluene and ethylbenzene were below laboratory-reporting limits, and benzene and xylenes were at low levels.
- The highest benzene concentrations were detected in MW-6 and MW-10 at 160 µg/L each.

- The highest toluene, ethylbenzene, and xylenes concentrations were detected in MW-6 at 89 µg/L, 470 µg/L, and 495 µg/L, respectively.
- Since the previous monitoring event (Fourth Quarter 2008), all BTEX concentrations have decreased at MW-1, MW-3, MW-6, and MW-8 and increased at MW-10.

Figure 5 shows the contour map of benzene concentrations in groundwater. The majority of the benzene plume appears to be in the vicinity of the pump islands at MW-6 and around MW-10. Refer to Table 1 for benzene concentration trends.

MtBE was below the laboratory-detection limit in MW-6. Detectable MtBE concentrations ranged from 1.2 µg/L in MW-3 to 22 µg/L in MW-10. Figure 6 shows the contour map of MtBE concentrations in groundwater. Since the previous monitoring event (Fourth Quarter 2008), MtBE has decreased in MW-1, MW-3, and MW-8, and increased in MW-10.

3. GROUNDWATER TREATMENT SYSTEM OPERATION

The treatment system began operating on December 9, 1999. Since startup, 4,158,091 gallons of groundwater have been treated and discharged (as of March 31, 2009), into the East Bay Municipal Utility District (EBMUD) sewer system under the existing discharge permit.

As of January 9, 2004, the previously installed pneumatic downhole pumps in FD West and FD Center were removed and replaced with electrical submersible pumps. On May 4, 2005, to maintain accurate recordings of total flow through the system, a newer totalizer meter was installed. On September 29, 2005, the existing 2,000-pound carbon vessel was replaced with a newer 2,000-pound carbon vessel that was refurbished with new carbon; the 200-pound carbon drum was also replaced. The former 2,000-pound vessel had become rusted from prolonged use. A schematic diagram of the remediation system is displayed in Figure 7.

On February 19, 2007, a carbon change-out was conducted on the remedial system, during which the 2,000-pound vessel was refurbished with new carbon and the 200-pound carbon drum was replaced.

To reduce the hydrocarbon source region in the vicinity of the UST cavity, SOMA oversaw installation of extraction well EX-1 by Gregg Drilling & Testing, Inc. on February 5, 2007. On April 20, 2007, SOMA installed an electric submersible pump in EX-1, connected it to the existing groundwater remediation system, and began extracting groundwater from the well. The pump is powered on the same electrical circuit as the two existing pumps inside the French drain risers. Underground piping to the existing system influent surge tank conveys the

extracted groundwater, which is then treated using granular activated carbon (GAC) and discharged to the local sanitary sewer system, in accordance with the EBMUD discharge permit. Figure 2 shows the location of EX-1.

Table 2 presents total volume of treated groundwater and groundwater analytical results. All effluent samples have remained below discharge limits set forth by EBMUD. The most current laboratory reports for the groundwater treatment system are included in Appendix D.

As of March 17, 2009, the treatment system has removed approximately 245.39 pounds of hydrocarbons and 87.67 pounds of MtBE from groundwater at the site. Figure 8 shows approximate masses of TPH-g and MtBE removed from impacted groundwater during operation of the treatment system.

4. OPERATION OF AIR SPARGING SYSTEM

From February 22, 2006 to March 6, 2006, SOMA oversaw installation of the air sparging system, which consists of nine vapor extraction wells and three air sparge wells. The air sparge wells were installed in the vicinity of the UST cavity, pump islands, and near MW-6 (Figure 2). Figures 9 and 10 provide block diagrams of the air sparging and soil vapor extraction (SVE) units.

In November 2005, prior to installation of the air sparging wells, SOMA collected air samples from previously existing SVE wells. Based on sampling results, which showed non-detectable contaminant levels, lines from SVE wells P-4 and ISL-1 to the vacuum pump were closed. This allowed for greater vacuum at the more impacted SVE wells.

The air sparging system was initially started on March 15, 2006. However, due to close proximity of the system to a residential area, the system was modified to reduce noise level. Specifically, a timer-controller was installed on the compressor to limit operation to daytime hours. To further reduce noise, the existing blower unit, installed in 2000, was rebuilt and foam placed around it as a noise suppressant.

To more effectively increase removal of contaminants from soil, an additional vacuum blower was installed in series to the existing vacuum blower on July 24, 2006. Rain causes the water table to rise, decreasing the actual layer of the unsaturated zone and greatly reducing the actual mass of contaminants in the soil that can be removed by the remedial system. Based on the reduction in the unsaturated region, as well as a reduction in the mass of contaminant vapors removed from the soil, the remedial system was shut down on November 7, 2006.

On May 23, 2007, SOMA restarted the SVE and air sparge systems and resumed recording field readings for these systems. Based on field measurements, it appeared that using both vacuum blowers in series on the same extraction manifold had little effect on the air flow rate into the system or concentrations of hydrocarbons in the extracted gases. Therefore, the inlet piping from the well field was divided into two manifolds with the intent to use each vacuum pump to extract from a separate set of wells. However, due to alterations in the facility's main electrical supply panel made by non-SOMA personnel without SOMA's knowledge, operation of both vacuum pumps at the same time was not possible because the resultant electrical load tripped the circuit breaker that includes the SVE system. Subsequent operation of the SVE system was limited to one blower at a time.

As shown in Table 3, approximately 967.2 pounds of hydrocarbons as vapor have been removed from impacted soil, as of September 28, 2007. The air sparging remedial system has been shut down since then. Table 3 also outlines the history of the SVE system.

5. FEBRUARY 2009 MULTI-PHASE EXTRACTION EVENT

The February 2009 MPE event, on February 2-6, utilized wells MW-1, MW-3, MW-4R, MW-6, and MW-8. MPE operational data is presented in Table 4. Extraction data is presented in Table 5. Field data sheets are presented in Appendix E. A representative sample was analyzed from the stack of the thermal oxidizer to show compliance with the Bay Area Air Quality Management District (BAAQMD) permit. Table 6 lists sample identifiers and analysis results of vapor samples.

MPE was performed at the above-mentioned wells starting Monday, February 2, 2009 at 10:00 and ending Friday, February 6, 2009 at 15:30. Total MPE time was 6,090 minutes, or 101.5 hours.

The total estimated mass of volatile organic compounds (VOCs) removed from soil vapor extracted during the MPE event was 34.11 lbs. The estimated VOC mass removal rate was 8.06 lbs/day.

As of the February 2009 MPE event, the cumulative total mass of VOCs extracted by MPE from extraction wells is 646.75 lbs (Figure 17). This includes the following amounts for each event: 64 lbs, December 2007 pilot test; 24.3 lbs, March 2008; 43.06 lbs, April 2008; 46.19 lbs, May 2008; 58.0 lbs, June 2008; 239.48 lbs, September 2008; 137.61 lbs, October 2008; and 34.11 lbs, February 2009. Figure 18 illustrates the mass of VOCs removed during each MPE event.

Listed in Table 7 are analysis results for groundwater samples collected from MW-1, MW-3, and MW-6 before and after the previous MPE events. For cost saving purposes, SOMA no longer conducts sampling before or after events. Instead, wells are sampled only during quarterly monitoring events. Figures 11 through 16 illustrate comparison of groundwater analysis results for previous MPE events.

Comparison of groundwater monitoring analysis results from Fourth Quarter 2008 (before February 2009 event) and First Quarter 2009 (after February 2009 event) groundwater monitoring events (Table 1) indicate that concentrations of TPH-g and BTEX decreased at MW-1, MW-3, and MW-6. In MW-8, concentrations of TPH-g increased and BTEX and MtBE decreased since the previous monitoring event (Fourth Quarter 2008). Increases in constituent concentrations illustrate that fuel hydrocarbons are still adsorbed to the smear zone while decreases illustrate that fuel hydrocarbons are being stripped and removed from the smear zone.

Figures 19 through 21 illustrate concentrations of TPH-g, benzene, and MtBE in monitoring well MW-1 from the Fourth Quarter 2007 monitoring event to the First Quarter 2009 monitoring event, including six MPE events conducted during 2008. No groundwater sampling was conducted during the February 2009 MPE event. Figures 22 through 24 illustrate concentrations of TPH-g, benzene, and MtBE in monitoring well MW-3 from the Fourth Quarter 2007 monitoring event to the First Quarter 2009 monitoring event, including six MPE events conducted during 2008.

6. CONCLUSIONS AND RECOMMENDATIONS

6.1 Conclusions

Conclusions based on findings of First Quarter 2009 groundwater monitoring are summarized below.

1. In general, based on low groundwater elevations observed at EX-1, a capture zone remains established at this location.
2. The highest TPH-g concentration was detected in MW-6 at 3,400 µg/L. Compared with the previous monitoring event (Fourth Quarter 2008), TPH-g concentrations have decreased in MW-1, MW-3, and MW-6. It appears that MW-1 and MW-6 are located within the remaining hotspot of the groundwater chemical plume.
3. It appears that MtBE concentrations in groundwater are diminishing across the site and that current maximum concentrations are below Environmental Screening Levels (ESLs) for industrial land use type where groundwater is not a potential drinking water source.

4. The source area remains in the vicinity of the UST cavity, pump islands, and eastern section of the mechanic shop at MW-1, MW-3, and MW-6. During this monitoring event, the highest benzene concentrations were detected in MW-6 and MW-10 at 160 µg/L each. The highest toluene, ethylbenzene, and xylenes concentrations were detected in MW-6 at 89 µg/L, 470 µg/L, and 495 µg/L, respectively
5. In general, the GAC and SVE systems have effectively reduced peak contaminant levels beneath the site. Since initial startup, approximately 245.39 pounds of hydrocarbons and 87.67 pounds of MtBE have been removed from groundwater. Approximately 967.2 pounds of petroleum hydrocarbons have been removed from the vadose zone.
6. MPE events at the site have effectively reduced contaminant concentrations. The cumulative total mass of VOCs extracted by MPE during the pilot test and seven subsequent MPE events is 646.75 lbs. Comparison of benzene concentrations with pre-MPE events shows a dramatic reduction in contaminant levels in source area wells such as MW-3 and MW-1.

6.2 Recommendations

Based on results of this monitoring event, and in accordance with ACEHS directive dated August 26, 2008, SOMA will conduct the following action items:

1. Continue operation of the pump-and-treat system to maintain the removal rate of contaminant masses in groundwater.
2. Continue groundwater monitoring of wells MW-1, MW-3, MW-6, MW-8, and MW-10 during quarterly monitoring events.
3. Conducting one additional MPE event using MW-6, MW-8 and MW-10 to reduce the contaminant levels below ESLs for site closure. Approximately 646.75 lbs of VOCs have been removed during MPE operations at the site.

7. REPORT LIMITATIONS

This report is the summary of work done by SOMA including observations and descriptions of site conditions. It includes analytical results produced by California state-certified laboratories for the current and previous monitoring events and summaries of data produced by environmental consultants for previous monitoring events. Quantities and locations of wells were selected to provide the required information, but may not be completely representative of entire site conditions. All conclusions and recommendations are based on

laboratory analysis results. Conclusions beyond those specifically stated in this document should not be inferred from this report.

SOMA warrants that services were provided in accordance with generally accepted environmental engineering and consulting practices at the time of this sampling.

Notes:

¹ Top of casing elevations were re-surveyed to comply with the EDF requirements for electronic reporting of data to the State Water Resources Control Board Database on August 9, 2002.

² MtBE was analyzed using the EPA Method 8021B and confirmed using 8260B.

C: Presence confirmed, but confirmation concentration differed by more than a factor of two.

H: Heavier hydrocarbons may have contributed to the quantitation.

NA: Not Analyzed

NA: Not Applicable, Well/Drain did not exist at time of sampling

NC: Not calculated. No top of casing elevation was available for MW-11.

ND, <: Not Detected above laboratory reporting limits.

NM: Not Measured

NS: Not Surveyed.

Y: Sample exhibits fuel pattern which does not resemble standard.

FDC: French drain center riser.

FDE: French drain east riser.

FDW: French drain west riser.

Well MW-4R replaced damaged well MW-4 on April 11, 2005. The first time well MW-4R was monitored was in the Second Quarter 2005

NS: Not surveyed. Well MW-11 was not surveyed due to obstructions surrounding well.

Well EX-1 was installed in the First Quarter 2007 and initially monitored in February 2007.

Pumping began on December 6, 1999								

Notes:

1 The designator "Effluent" used on sampling and laboratory documents refers to samples collected from PSP #1.

2 MTBE was analyzed using EPA Method 8260B, prior to the September 2003. After September 2003, MtBE was only analyzed by EPA Method 8021B.

3 Lab data as shown for Oct. 2002 is erroneous data. During lab analysis a high detection of 2-Butanone was detected in only the effluent sample. The influent sample for 2-Butanone was at only 20 ppb. This caused a high dilution factor causing a high non-detectable value. The high TPH-g value was misrepresentative due to the Y and Z flags.

ND, < : Not Detected above laboratory reporting limits

NA: Not Analyzed

NR: Not recorded. Totalizer reading not recorded.

Y: Sample exhibits fuel pattern which does not resemble standard

Z: Sample exhibits unknown single peak or peaks

Notes:

¹ The representative molecular weight of hydrocarbons was assumed to be 150 gram/mole and used the measured temperature of Vapor (25°C) in converting ppm-v to ppm on mass basis.

² System accidentally shut down from main box, readings taken 30 minutes after startup.

³ GAC Replaced

⁴ GAC-1 removed, new GAC installed at effluent end

⁵ SVE System turned off for rainy season due to low influent concentration

⁶ system down, hoses disconnected and GAC moved for replacement

⁷ system down for electrical repair

⁸ Carbon change-out of three drums, moved new effluent drum on 10/25/01 to GAC-

⁹ system shut-down due to high effluent value

¹⁰ System re-started (since November 21, 2001), installed new 4-55 gallon vapor phase carbon vessels, repaired blow

¹¹ System was shut-down due to low influent reading.

¹² System was restarted on 6/12/02

¹³ System was re-started.

Data for Octo

NC: Not Calcd

Calculations

Airflow: Flowrate (ft³/min) * 60 min * Time Elapsed (hrs) * 28.3 liters/ft³

Mass Removed: Time Elapsed (hrs) * 60 min * Flowrate (ft^3/min) * (28.3 m^3/ft^3)*

Mass Removed: Time Elapsed (hrs) = 60 min; Filtrate (L) = 3.0 L; (26.3 g/3.0 L)

$$((\text{PID reading} * (102 \text{ grams TPH-a}/\text{mole}) * (1 \text{ mole} / 24.4 \text{ L})) * (1/1000 \text{ m}^3)) * (1 \text{ lb}/454 \text{ grams})$$

Notes

 ppmv parts per million vapor
 In of Hg inches of mercury
 In of H₂O inches of water

°F degrees Fahrenheit

scfm standard cubic feet per minute

 **Flow Equation Used: Q (SCFM) = 128.8*K*D^5\sqrt((P*\Delta P)/((T+460)*S_s))

 ΔP = Differential pressure measured through pitot tube expressed in
 inches of water column

Q = Flow expressed in SCFM, (standard cubic feet per minute)

K = 0.67, Flow coefficient for 3 inch diameter pipe

D = 3, Diameter of pipe expressed in inches

P = 14.7, Standard Atmospheric Pressure (psia)

T = Temperature in degrees Fahrenheit + 460 =

°Rankine

 S_s= 1 = Specific Gravity of air at 60°F (15.6°C)

APPENDIX A

Standard Operating Procedures for Conducting Groundwater Monitoring Activities

First Quarter 2009: Groundwater Monitoring and Remediation System Report
With Evaluation of Effectiveness of Monthly MPE

Standard Operating Procedures for Conducting Groundwater Monitoring Activities

Prior to measurement of groundwater depth at each well, equalization with the surrounding aquifer must be achieved. Initially, the well cap is removed and the pressure is allowed to dissipate, creating a more stable water table level within the well. After about 10-15 minutes, once the water level in the well stabilizes, the depth to groundwater is measured from the top of the casing to the nearest 0.01 foot using an electric sounder.

Prior to sample collection, each well is purged using a battery-operated, 2-inch-diameter pump (Model ES-60 DC). During purging, groundwater is measured for parameters such as dissolved oxygen (DO), pH, temperature, electrical conductivity (EC), and oxygen-reduction potential (ORP) using a Hanna HI-9828 multi-parameter instrument. Turbidity is measured using a Hanna HI-98703 portable turbidimeter. The equipment is calibrated at the Site using standard solutions and procedures provided by the manufacturer.

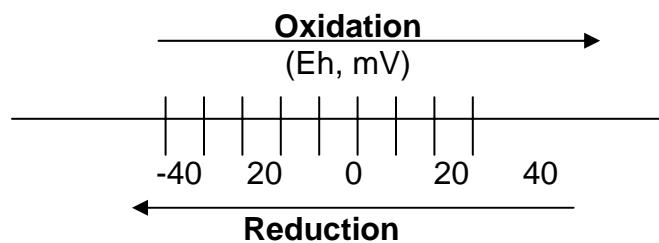

The pH of groundwater has an effect on the activity of microbial populations in the groundwater. The groundwater temperature affects the metabolic activity of bacteria. The groundwater EC is directly related to the concentration of total dissolved solids (TDS) in solution.

There is a strong correlation between the turbidity level and the biological oxygen demand of natural water bodies. The main purpose for checking the turbidity level is to provide a general overview of the extent of the suspended solids in the groundwater.

ORP is the measure of the potential for an oxidation or reduction process to occur. In the oxidation process, a molecule or ion loses one or several electrons. In the reduction process, a molecule or ion gains one or several electrons. The unit of the redox potential is the volt or millivolt. The most important redox reaction in petroleum-contaminated groundwater is the oxidation of petroleum hydrocarbons in the presence of bacteria and free molecular oxygen. Because the solubility of O₂ in water is low (9 mg/L at 25 °C and 11 mg/L at 5 °C), and because the rate of O₂ replenishment in subsurface environments is limited, DO can be entirely consumed when the oxidation of only a small amount of petroleum hydrocarbons occurs.

Oxidation of petroleum hydrocarbons can still occur when all the dissolved O₂ in the groundwater is consumed; however, the oxidizing agents (i.e., the constituents that undergo reduction) now become NO₃⁻, MnO₂, Fe (OH)₃, SO₄²⁻ and others (Freeze and Cherry, 1979). As these oxidizing agents are consumed, the groundwater environment becomes more and more reduced. If the process advances far enough, the environment may become so strongly reduced that the

petroleum hydrocarbons undergo anaerobic degradation, resulting in the production of methane and carbon dioxide. The concept of oxidation and reduction in terms of changes in oxidation states is illustrated below.

Purging of wells continues until the parameters for DO, pH, temperature, EC, turbidity, and redox stabilize, or three casing volumes are purged.

Once stabilization occurs, the groundwater samples are also tested on-site for ferrous iron (Fe^{+2}), nitrate (NO_3^-), and sulfate (SO_4^{+2}) concentrations.

Fe^{+2} , NO_3^- , and SO_4^{+2} are measured colorimetrically using the Hach Colorimeter Model 890, a microprocessor-controlled photometer suitable for colorimetric testing in the laboratory or the field. The required reagents for each specific test are provided in AccuVac ampuls.

For sampling purposes, after purging a disposable polyethylene bailer is used to collect sufficient samples from each monitoring well for laboratory analyses. Groundwater samples are transferred into 40-mL VOA vials and preserved with hydrochloric acid. The vials are sealed to prevent development of air bubbles within the headspace. For TPH-d analysis, groundwater samples are collected using 1-L, amber, nonpreserved glass containers. Samples are placed in an ice-filled cooler and maintained at 4°C. A chain of custody form is prepared to be delivered with the samples, which are delivered promptly to a California state-certified analytical laboratory.

CASE NARRATIVE

Laboratory number: **210937**
Client: **SOMA Environmental Engineering Inc.**
Project: **2331**
Location: **3609 Int'l Blvd., Oakland**
Request Date: **03/25/09**
Samples Received: **03/25/09**

This data package contains sample and QC results for five water samples, requested for the above referenced project on 03/25/09. The samples were received cold and intact.

Volatile Organics by GC/MS (EPA 8260B):

MW-1 (lab # 210937-001) was diluted due to high non-target analytes. No other analytical problems were encountered.

1. Did cooler come with a shipping slip (airbill, etc) YES
Shipping info _____2A. Were custody seals present? ... YES (circle) on cooler on samples NO
How many _____ Name _____ Date _____2B. Were custody seals intact upon arrival? YES NO N/A3. Were custody papers dry and intact when received? YES NO 4. Were custody papers filled out properly (ink, signed, etc)? YES NO 5. Is the project identifiable from custody papers? (If so fill out top of form) YES NO

6. Indicate the packing in cooler: (if other, describe) _____

 Bubble Wrap Foam blocks Bags None Cloth material Cardboard Styrofoam Paper towels

7. Temperature documentation:

Type of ice used: Wet Blue/Gel None Temp(°C) _____ Samples Received on ice & cold without a temperature blank Samples received on ice directly from the field. Cooling process had begun8. Were Method 5035 sampling containers present? YES

If YES, what time were they transferred to freezer? _____

9. Did all bottles arrive unbroken/unopened? YES NO 10. Are samples in the appropriate containers for indicated tests? YES NO 11. Are sample labels present, in good condition and complete? YES NO 12. Do the sample labels agree with custody papers? YES NO 13. Was sufficient amount of sample sent for tests requested? YES NO 14. Are the samples appropriately preserved? YES NO N/A 15. Are bubbles > 6mm absent in VOA samples? YES NO N/A 16. Was the client contacted concerning this sample delivery? YES NO

If YES, Who was called? _____ By _____ Date: _____

CASE NARRATIVE

Laboratory number: **210702**
Client: **SOMA Environmental Engineering Inc.**
Project: **2333**
Location: **3609 International Blvd**
Request Date: **03/17/09**
Samples Received: **03/17/09**

This data package contains sample and QC results for three water samples, requested for the above referenced project on 03/17/09. The samples were received cold and intact.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.
