Re: **Semi-Annual Groundwater Monitoring Report – Fourth Quarter 2013 & First Quarter 2014**  
German Autocraft, 301 East 14<sup>th</sup> Street, San Leandro, California  
Fuel Leak Case No. RO0000302; Global ID T0600100639

Dear Mr. Detterman:

Stratus Environmental, Inc. (Stratus) is submitting the attached report presenting a summary of work performed at the site during the fourth quarter 2013 and the first quarter 2014 on behalf of Mr. Seung Lee for the German Autocraft facility, located at 301 East 14<sup>th</sup> Street, San Leandro, California. Stratus representatives, whose signatures appear below, declare under penalty of perjury, that the information contained in the attached report are true and correct to the best of our knowledge.

If you have any questions regarding this project, please contact Trevor Hartwell at (530) 313-9966.

Sincerely,

**STRATUS ENVIRONMENTAL, INC.**

Trevor M. Hartwell, P.G.  
Project Manager

Jay R. Johnson, P.G.  
Principal Geologist

Attachment: Semi-Annual Groundwater Monitoring Report, Fourth Quarter 2013 & First Quarter 2014

cc: Mr. Seung Lee  
Ms. Cherie McCaulou, RWQCB-SF  
Mr. Ramirez

**GERMAN AUTOCRAFT FACILITY  
SEMI-ANNUAL GROUNDWATER MONITORING REPORT**

Facility Address: 301 East 14<sup>th</sup> Street, San Leandro, California  
 Consulting Co./Contact Person: Stratus Environmental, Inc. / Trevor Hartwell  
 Consultant Project No: 2076-0301-01  
 Primary Agency/Regulatory ID No: Mr. Mark Detterman, Alameda County Environmental Health  
 Department (ACEHD) Fuel Leak Case No. RO0000302; Global ID  
 T0600100639

**WORK PERFORMED THIS PERIOD (Fourth Quarter 2013 & First Quarter 2014):**

1. In December 2013, the ACEHD conducted a review of the site against the State Water Resources Control Board (SWRCB) Low Threat Closure Policy (LTCP) and identified impediments to closure of the site. These impediments were addressed in Stratus' *Technical Memo/Work Plan* (Work Plan) submitted to ACEHD on March 5, 2014.
2. On March 11, 2014, Stratus conducted semi-annual groundwater monitoring and sampling activities at the site. During this event, groundwater monitoring wells MW-2, MW-3, MW-8 through MW-14, and MW-1A were gauged for depth to water and evaluated for the presence of free product. MW-5 was dry at the time of gauging and no depth to water data was collected. Following gauging, wells MW-8, MW-9, MW-10, MW-12 through MW-14, and MW-1A were purged, and groundwater samples were collected. The owner of domestic well 141 Farrelly was unable to be contacted, and this well was not sampled during the first quarter 2014 sampling event. All groundwater samples were forwarded to a state-certified analytical laboratory for analysis. Well construction details are summarized in Table 1. Tabulated historical groundwater elevation and analytical results are summarized in Table 2.

**WORK PROPOSED FOR NEXT PERIOD (Second and Third Quarters 2014):**

1. In accordance with SWRCB's Resolution No. 2009-0042, no groundwater monitoring or sampling activities are planned during the second quarter 2014. Stratus will conduct monitoring and sampling activities during the third quarter 2014.
2. Upon approval from ACEHD, Stratus will begin activities associated with implementing the March 2014 Work Plan.

Current Phase of Project: Remedial Selection / Interim Remedial Action (RS/IRA)  
 Frequency of Groundwater Monitoring: All Wells = Semi-annually (1<sup>st</sup> and 3<sup>rd</sup> quarters)  
 Frequency of Groundwater Sampling: MW-8, -9, -10, -12, -13, -14, -1A, 141 Farrelly = (1Q & 3Q)  
 MW-2, -3, -5, -11 = (3Q)  
 Groundwater Sampling Date: March 11, 2014  
 Is Free Product (FP) Present on Site: No  
 Approximate Depth to Groundwater: 25.10 to 27.31 feet below top of well casing  
 Groundwater Flow Direction: West-southwest  
 Groundwater Gradient: 0.003 ft/ft

**DISCUSSION:**

On March 11, 2014, Stratus conducted semi-annual groundwater monitoring and sampling activities at the site. During this event, groundwater monitoring wells MW-2, MW-3, MW-8 through MW-14, and MW-1A

were monitored for depth to water and evaluated for the presence of free product. Following depth to water collection, wells MW-8, MW-9, MW-10, MW-12 through MW-14, and MW-1A were purged and sampled. The owner of the 141 Farrelly domestic well was unable to be contacted, and no sample was able to be collected during the first quarter 2014 sampling event (last sampled March 2012). All groundwater samples collected were analyzed at a state-certified analytical laboratory for gasoline range organics (GRO) by EPA Method SW8015B/SW8260B, and for benzene, toluene, ethylbenzene, and total xylenes (BTEX compounds) by EPA Method SW8260B. Field data sheets, sampling procedures, and the laboratory analytical report are included as Attachments A, B, and C, respectively. Analytical results of sampled wells and depth to groundwater measurements have been uploaded to the State of California's GeoTracker database. Documentation of these data uploads is attached in Appendix D.

Eleven groundwater monitoring wells (MW-2, MW-3, MW-5, MW-8 through MW-14, and MW-1A) are installed to depths ranging from approximately 30 to 40 feet below ground surface (bgs) and monitor groundwater occurrence and quality in the uppermost water-bearing zone beneath the site. At the time of the first quarter 2014 monitoring event, groundwater elevations in all gauged wells had increased between 0.48 and 0.63 feet since the previous monitoring event (September 9, 2013). Depth-to-water measurements were converted to feet above mean sea level (MSL) and used to construct a groundwater elevation contour map (Figure 2). The groundwater flow direction was generally to the west-southwest with a calculated gradient of 0.003 ft/ft. Although the groundwater flow direction varies predominantly between west and southwest, variations to the west-northwest and south-southwest have been observed (Figure 5).

Groundwater beneath the site is impacted with GRO and BTEX. During the first quarter 2014 sampling event, concentrations of GRO were reported in five of the seven sampled wells with increasing GRO concentrations observed in offsite upgradient wells MW-10 (7,700 micrograms per liter [ $\mu\text{g/L}$ ]), MW-12 (4,600  $\mu\text{g/L}$ ), and MW-1A (3,400  $\mu\text{g/L}$ ). Benzene was only reported in well MW-10 (44  $\mu\text{g/L}$ ); however the laboratory noted that reporting limits for wells MW-9, MW-12, and MW-1A were increased due to high concentrations of target analytes. Samples collected from monitoring wells MW-13 and MW-14 reported no concentrations of any sampled analytes during the first quarter 2014 sampling event. An iso-concentration map illustrating GRO concentrations is included as Figure 3. A concentration map illustrating benzene concentrations is included as Figure 4.

#### **ATTACHMENTS:**

- Table 1 Well Construction Details
- Table 2 Groundwater Elevation and Analytical Summary
- Figure 1 Site Location Map
- Figure 2 Groundwater Elevation Contour Map (First Quarter 2014)
- Figure 3 GRO Iso-concentration Contour Map (First Quarter 2014)
- Figure 4 Benzene Concentration Map (First Quarter 2014)

## **APPENDIX B**

### **SAMPLING AND ANALYSES PROCEDURES**

## **SAMPLING AND ANALYSIS PROCEDURES**

---

The sampling and analysis procedures as well as the quality assurance plan are contained in this appendix. The procedures and adherence to the quality assurance plan will provide for consistent and reproducible sampling methods; proper application of analytical methods; accurate and precise analytical results; and finally, these procedures will provide guidelines so that the overall objectives of the monitoring program are achieved.

### **Ground Water and Liquid-Phase Petroleum Hydrocarbon Depth Assessment**

A water/hydrocarbon interface probe is used to assess the liquid-phase petroleum hydrocarbon (LPH) thickness, if present, and a water level indicator is used to measure the ground water depth in monitoring wells that do not contain LPH. Depth to ground water or LPH is measured from a datum point at the top of each monitoring well casing. The datum point is typically a notch cut in the north side of the casing edge. If a water level indicator is used, the tip is subjectively analyzed for hydrocarbon sheen.

### **Subjective Analysis of Ground Water**

Prior to purging, a water sample is collected from the monitoring well for subjective assessment. The sample is retrieved by gently lowering a clean, disposable bailer to approximately one-half the bailer length past the air/liquid interface. The bailer is then retrieved, and the sample contained within the bailer is examined for floating LPH and the appearance of a LPH sheen.

### **Monitoring Well Purging and Sampling**

Monitoring wells are purged using a pump or bailer until pH, temperature, and conductivity of the purge water has stabilized and a minimum of three well volumes of water have been removed. If three well volumes can not be removed in one half hour's time the well is allowed to recharge to 80% of original level. After recharging, a ground water sample is then removed from each of the wells using a disposable bailer.

A Teflon bailer, electric submersible or bladder pump will be the only equipment used for well sampling. When samples for volatile organic analysis are being collected, the pump flow will be regulated at approximately 100 milliliters per minute to minimize pump effluent turbulence and aeration. Glass bottles of at least 40-milliliters volume and fitted with Teflon-lined septa will be used in sampling for volatile organics. These bottles will be filled completely to prevent air from remaining in the bottle. A positive meniscus forms when the bottle is completely full. A convex Teflon septum will be placed over the positive meniscus to eliminate air. After the bottle is capped, it is inverted and tapped to verify that it contains no air bubbles. The sample containers for other parameters will be filled, filtered as required, and capped.

The water sample is collected, labeled, and handled according to the Quality Assurance Plan. Water generated during the monitoring event is disposed of according to regulatory accepted method pertaining to the site.

## **QUALITY ASSURANCE PLAN**

Procedures to provide data quality should be established and documented so that conditions adverse to quality, such as deficiencies, deviations, nonconformants, defective material, services, and/or equipment, can be promptly identified and corrected.

### **General Sample Collection and Handling Procedures**

Proper collection and handling are essential to ensure the quality of a sample. Each sample is collected in a suitable container, preserved correctly for the intended analysis, and stored prior to analysis for no longer than the maximum allowable holding time. Details on the procedures for collection and handling of samples used on this project can be found in this section.

### **Soil and Water Sample Labeling and Preservation**

Label information includes a unique sample identification number, job identification number, date, and time. After labeling all soil and water samples are placed in a Ziploc® type bag and placed in an ice chest cooled to approximately 4° Celsius. Upon arriving at Stratus' office the samples are transferred to a locked refrigerator cooled to approximately 4° Celsius. Chemical preservation is controlled by the required analysis and is noted on the chain-of-custody form. Trip blanks supplied by the laboratory accompany the groundwater sample containers and groundwater samples.

Upon recovery, the sample container is sealed to minimize the potential of volatilization and cross-contamination prior to chemical analysis. Soil sampling tubes are typically closed at each end with Teflon® sheeting and plastic caps. The sample is then placed in a Ziploc® type bag and sealed. The sample is labeled and refrigerated at approximately 4° Celsius for delivery, under strict chain-of-custody, to the analytical laboratory.

### **Sample Identification and Chain-of-Custody Procedures**

Sample identification and chain-of-custody procedures document sample possession from the time of collection to ultimate disposal. Each sample container submitted for analysis has a label affixed to identify the job number, sampler, date and time of sample collection, and a sample number unique to that sample. This information, in addition to a description of the sample, field measurements made, sampling methodology, names of on-site personnel, and any other pertinent field observations, is recorded on the borehole log or in the field records. The samples are analyzed by a California-certified laboratory.

A chain-of-custody form is used to record possession of the sample from time of collection to its arrival at the laboratory. When the samples are shipped, the person in custody of them relinquishes the samples by signing the chain-of-custody form and

noting the time. The sample-control officer at the laboratory verifies sample integrity and confirms that the samples are collected in the proper containers, preserved correctly, and contain adequate volumes for analysis. These conditions are noted on a Laboratory Sample Receipt Checklist that becomes part of the laboratory report upon request.

If these conditions are met, each sample is assigned a unique log number for identification throughout analysis and reporting. The log number is recorded on the chain-of-custody form and in the legally-required log book maintained by the laboratory. The sample description, date received, client's name, and other relevant information is also recorded.

### **Equipment Cleaning**

Sample bottles, caps, and septa used in sampling for volatile and semivolatile organics will be triple rinsed with high-purity deionized water. After being rinsed, sample bottles will be dried overnight at a temperature of 200°C. Sample caps and septa will be dried overnight at a temperature of 60°C. Sample bottles, caps, and septa will be protected from solvent contact between drying and actual use at the sampling site. Sampling containers will be used only once and discarded after analysis is complete.

Plastic bottles and caps used in sampling for metals will be soaked overnight in a 1-percent nitric acid solution. Next, the bottles and caps will be triple rinsed with deionized water. Finally, the bottles and caps will be air dried before being used at the site. Plastic bottles and caps will be constructed of linear polyethylene or polypropylene. Sampling containers will be used only once and discarded after analysis is complete. Glass and plastic bottles used by Stratus to collect groundwater samples are supplied by the laboratory.

Before the sampling event is started, equipment that will be placed in the well or will come in contact with groundwater will be disassembled and cleaned thoroughly with detergent water, and then steam cleaned with deionized water. Any parts that may absorb contaminants, such as plastic pump valves, etc. will be cleaned as described above or replaced.

During field sampling, equipment surfaces that are placed in the well or contact groundwater will be steam cleaned with deionized water before the next well is purged or sampled. Equipment blanks will be collected and analyzed from non-disposable sampling equipment that is used for collecting groundwater samples at the rate of one blank per twenty samples collected.

### **Internal Quality Assurance Checks**

Internal quality assurance procedures are designed to provide reliability of monitoring and measurement of data. Both field and laboratory quality assurance checks are necessary to evaluate the reliability of sampling and analysis results. Internal quality assurance procedures generally include:

- Laboratory Quality Assurance

- Documentation of instrument performance checks
- Documentation of instrument calibration
- Documentation of the traceability of instrument standards, samples, and data
- Documentation of analytical and QC methodology (QC methodology includes use of spiked samples, duplicate samples, split samples, use of reference blanks, and check standards to check method accuracy and precision)

- Field Quality Assurance

- Documentation of sample preservation and transportation
- Documentation of field instrument calibration and irregularities in performance

Internal laboratory quality assurance checks will be the responsibility of the contract laboratories. Data and reports submitted by field personnel and the contract laboratory will be reviewed and maintained in the project files.

**Types of Quality Control Checks**

Samples are analyzed using analytical methods outlined in EPA Manual SW 846 and approved by the California Regional Water Quality Control Board-Central Valley Region in the Leaking Underground Fuel Tanks (LUFT) manual and appendices. Standard contract laboratory quality control may include analysis or use of the following:

- Method blanks – reagent water used to prepare calibration standards, spike solutions, etc. is analyzed in the same manner as the sample to demonstrate that analytical interferences are under control.
- Matrix spiked samples – a known amount of spike solution containing selected constituents is added to the sample at concentrations at which the accuracy of the analytical method is to satisfactorily monitor and evaluate laboratory data quality.
- Split samples – a sample is split into two separate aliquots before analysis to assess the reproducibility of the analysis.
- Surrogate samples – samples are spiked with surrogate constituents at known concentrations to monitor both the performance of the analytical system and the effectiveness of the method in dealing with the sample matrix.
- Control charts – graphical presentation of spike or split sample results used to track the accuracy or precision of the analysis.
- Quality control check samples – when spiked sample analysis indicates atypical instrument performance, a quality check sample, which is prepared independently of the calibration standards and contains the constituents of interest, is analyzed to confirm that measurements were performed accurately.

- Calibration standards and devices – traceable standards or devices to set instrument response so that sample analysis results represent the absolute concentration of the constituent.

Field QA samples will be collected to assess sample handling procedures and conditions. Standard field quality control may include the use of the following, and will be collected and analyzed as outlined in EPA Manual SW 846.

- Field blanks – reagent water samples are prepared at the sampling location by the same procedure used to collect field groundwater samples and analyzed with the groundwater samples to assess the impact of sampling techniques on data quality. Typically, one field blank per twenty groundwater samples collected will be analyzed per sampling event.
- Field replicates – duplicate or triplicate samples are collected and analyzed to assess the reproducibility of the analytical data. One replicate groundwater sample per twenty samples collected will be analyzed per sampling event, unless otherwise specified. Triplicate samples will be collected only when specific conditions warrant and generally are sent to an alternate laboratory to confirm the accuracy of the routinely used laboratory.
- Trip blanks – reagent water samples are prepared before field work, transported and stored with the samples and analyzed to assess the impact of sample transport and storage for data quality. In the event that any analyte is detected in the field blank, a trip blank will be included in the subsequent groundwater sampling event.

Data reliability will be evaluated by the certified laboratory and reported on a cover sheet attached to the laboratory data report. Analytical data resulting from the testing of field or trip blanks will be included in the laboratory's report. Results from matrix spike, surrogate, and method blank testing will be reported, along with a statement of whether the samples were analyzed within the appropriate holding time.

Stratus will evaluate the laboratory's report on data reliability and note significant QC results that may make the data biased or unacceptable. Data viability will be performed as outlined in EPA Manual SW 846. If biased or unacceptable data is noted, corrective actions (including re-sample/re-analyze, etc.) will be evaluated on a site-specific basis.

## QC Summary Report

Work Order:  
14031345

### Method Blank

Type MBLK Test Code: EPA Method SW8015B/C / SW8260B

File ID: C:\HPCHEM\MS10\DATA\140314\14031404.D

Batch ID: MS10W0314B

Analysis Date: 03/14/2014 10:52

Sample ID: MBLK MS10W0314B

Units: µg/L

Run ID: MSD\_10\_140314A

Prep Date: 03/14/2014 10:52

Analyte	Result	PQL	SpkVal	SpkRefVal	%REC	LCL(ME)	UCL(ME)	RPDRefVal	%RPD(Limit)	Qual
TPH-P (GRO)	ND	50								
Surr: 1,2-Dichloroethane-d4	9.69		10		97	70	130			
Surr: Toluene-d8	10.1		10		101	70	130			
Surr: 4-Bromofluorobenzene	9.12		10		91	70	130			

### Laboratory Control Spike

Type LCS Test Code: EPA Method SW8015B/C / SW8260B

File ID: C:\HPCHEM\MS10\DATA\140314\14031403.D

Batch ID: MS10W0314B

Analysis Date: 03/14/2014 09:03

Sample ID: GLCS MS10W0314B

Units: µg/L

Run ID: MSD\_10\_140314A

Prep Date: 03/14/2014 09:03

Analyte	Result	PQL	SpkVal	SpkRefVal	%REC	LCL(ME)	UCL(ME)	RPDRefVal	%RPD(Limit)	Qual
TPH-P (GRO)	415	50	400		104	70	130			
Surr: 1,2-Dichloroethane-d4	9.83		10		98	70	130			
Surr: Toluene-d8	9.54		10		95	70	130			
Surr: 4-Bromofluorobenzene	9.48		10		95	70	130			

### Sample Matrix Spike

Type MS Test Code: EPA Method SW8015B/C / SW8260B

File ID: C:\HPCHEM\MS10\DATA\140314\14031417.D

Batch ID: MS10W0314B

Analysis Date: 03/14/2014 14:32

Sample ID: 14031303-01AGS

Units: µg/L

Run ID: MSD\_10\_140314A

Prep Date: 03/14/2014 14:32

Analyte	Result	PQL	SpkVal	SpkRefVal	%REC	LCL(ME)	UCL(ME)	RPDRefVal	%RPD(Limit)	Qual
