Re: Soil Sampling, Excavation  
Disposal  
Chevron Service Station # 92582  
Dublin, California  
WGR # 1-124.01

Dear Mr. Foss:

This letter report describes the work performed by Western Geologic Resources Inc. (WGR) at the Chevron service station in Dublin, California, located at the corner of Dublin Boulevard and Village Parkway. The scope of work for the project included backfill material sampling, excavation and disposal (Figure 1).

The scope of work for this phase of investigation was:

- 1.) Collect six backfill material soil samples from existing pea gravel inside the former underground storage tank excavation;
- 2.) Analyze the six soil samples for total purgeable petroleum hydrocarbons (TPPH) by EPA Methods 8015 by Central Coast Analytical Services in Napa, California;
- 3.) Excavate the backfill material from former tank pit.
- 4.) Based on laboratory results, transport and dispose of the backfill material to the proper disposal facility(s); and
- 5.) Review all field and laboratory data and prepare a report.

#### BACKGROUND

On 16 February 1989, three underground storage tanks were removed under the supervision of Blaine Technical Services, Inc. (BTS) of San Jose, California. BTS collected four native soil samples from below the former underground storage tanks and collected a water sample from ponded water within the excavation. The soil and water samples were analyzed by Sequoia Analytical Laboratories by EPA Methods 8015 and 8020. The analytic results for soil samples 1, 2, 3 and 4 indicated concentrations of 2.6 parts per million (ppm) 1.9 ppm, 2.4 ppm and 29 ppm respectively.

Bob Foss/12 April 1989

2

The water sample contained low to medium boiling point hydrocarbons at 100 ppm. Based on the hydrocarbon concentrations in both the soil and water samples, WGR was contracted by Chevron to oversee further excavation and proper disposal.

### SOIL SAMPLING

On 14 March 1989, WGR project hydrogeologist, Lee Otis collected six backfill samples from pea gravel backfill material in the former underground storage tank excavation (Figure 2). The samples were collected from a backhoe bucket. The soil samples were collected per WGR's standard operating procedure (Attachment A).

### ANALYTIC RESULTS

The six backfill samples were analyzed by Central Coast Analytical Services (CCAS) for EPA Method 8015. The analytic results for the soil samples indicated concentrations above 100 ppm for TPPH, as gasoline in all six soil samples. The analytic results were 300 ppm, 1200 ppm and 600 ppm, for soil samples S-1, S-2 and S-3 and 500 ppm, 200 ppm and 900 ppm for soil samples S-4, S-5 and S-6, respectively. Chain-of-custody forms and analytic results are included as Attachments B & C.

### EXCAVATION, STOCKPILING AND WATER PUMPING

Based on the concentrations of the pea gravel, it was excavated and separated into two separate stockpiles on 17 March 1989 by WGR environmental technician Elizabeth Adams. The pea gravel was separated into Class I and Class II stockpiles by first excavating in the areas where soil samples S-2 and S-6 were located (Figure 2). The pea gravel from these sample locations were separated into a Class I stockpile because the TPPH concentrations were above 900 ppm. The remaining soils were excavated and stockpiled separately into a Class II stockpile.

During the excavation of the pea gravel, 2846 gallons of water that contained dissolved hydrocarbons was pumped out of the excavation by Erikson Trucking and disposed of at Gibson Oil in Bakersfield, California.

### SOIL DISPOSAL

On 20 March 1989, approximately 18 cubic yards of Class I material was manifested and transported to Casmalia Resources, Inc., in Casmalia,

Bob Foss/12 April 1989

3

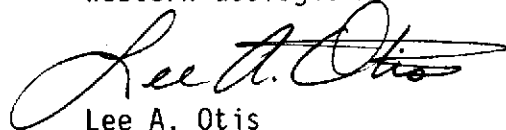

California. The remaining pea gravel was a Class II material and on 20 March 1989, approximately 162 cubic yards were transported to McKittrick Landfill in Bakersfield, California (manifests in Appendix D).

### SUMMARY AND CONCLUSIONS

Based on laboratory results, the pea gravel associated with the removal of the former underground storage tanks were disposed of in both Class I and II disposal facilities. The Class I stockpile was manifested and transported to Casmalia Resources, Inc., and the Class II stockpile was transported to McKittrick Landfill in Bakersfield, California.

We appreciate the opportunity to provide geologic and environmental consulting services to Chevron and trust this report meets your needs. If you have any questions please call us at (415) 457-7595.

Sincerely,  
Western Geologic Resources, Inc.

Lee A. Otis

STANDARD OPERATING PROCEDURES

**WESTERN GEOLOGIC RESOURCES, INC.  
STANDARD OPERATING PROCEDURES  
RE: STOCKPILE SOIL SAMPLING  
SOP-5**

Soil samples from soil stockpiles are collected in thin-walled, 4-inch long by 2-inch outside diameter brass tubes. The sampling protocol for stockpile sampling is determined by the dimensions of the soil pile. An average of one soil sample per ten cubic yards is collected. The samples are composited prior to chemical analysis. The number of samples in a composite depends on the amount of cubic yards of soil. Typically, composites are made up of a minimum of two samples, and range up to a maximum of four samples.

The sampling tools used are hand driven sampling devices that maintain the physical integrity of the samples while minimizing volatilization. Upon removal from the sampling device, the tubes are immediately trimmed and sealed with aluminum foil and plastic end caps. They are then hermetically sealed with duct tape, labeled, and refrigerated until delivery, under chain-of-custody, to the laboratory.
