Clayton Project No.70-97066.00.000

Subject: Fourth Quarter 2000 Groundwater Monitoring Results for the property at
630 29th Avenue in Oakland, California

Dear Mr. Chan:

Clayton is pleased to present the results for the fourth quarter 2000 groundwater monitoring event performed at 630 29th Avenue in Oakland, California. The risk assessment-feasibility study will be submitted in the near future following submission of this current quarterly.

If you have any comments or questions regarding the report please contact me at (925) 426-2665.

Sincerely,

A handwritten signature in black ink that appears to read "Warren B. Chamberlain".

1. INTRODUCTION

Clayton Group Services, Inc., (Clayton) has prepared this quarterly groundwater monitoring report to document the results of the Fourth Quarter, 2000 groundwater monitoring event for the former Lemoine Sausage Facility located at 630 29th Avenue in Oakland, California (Figure 1). Groundwater monitoring is being performed at the subject property to monitor the distribution and concentration of dissolved petroleum hydrocarbons in shallow groundwater.

2. SITE DESCRIPTION AND HISTORY

A single 1,000-gallon gasoline underground storage tank (UST) and associated plumbing/piping were formerly located beneath the sidewalk of 7th Street and adjacent (east) of the subject property building (Figure 2). The associated fuel dispenser was located in a "cubby hole" near the building's roll-up door. The UST and associated piping were removed on November 21, 1996 and confirmation soil samples were collected. A petroleum hydrocarbon sheen was noted on top of groundwater and petroleum hydrocarbons were detected in the confirmation soil samples collected at the time of the UST removal. The UST removal and results of confirmation sampling were presented in the Clayton report, "*Underground Storage Tank Closure Report*", dated September 24, 1997.

The following report have been issued to document previous site investigation and findings:

- "*Limited Subsurface Investigation, Former Lemoine Sausage Facility, 630 29th Avenue, Oakland, California*" report, dated April 1998.
- "*Limited Groundwater Investigation, Former Lemoine Sausage Facility, 630 29th Avenue, Oakland, California*" dated March 1999.
- "*Additional Field Investigation, and Groundwater Monitoring for the Former Lemoine Sausage Facility, 630 29th Avenue, Oakland, California*", dated November 7, 2000.

3. QUARTERLY GROUNDWATER MONITORING

All monitoring wells (MW-1 through MW-8) were sampled to determine groundwater elevations and groundwater quality.

3.1. GROUNDWATER LEVEL MEASUREMENTS

Depth to water was measured in each monitoring well to determine groundwater elevations, and the site's groundwater gradient and flow direction. Depth to water measurements were obtained with an electronic water level probe. All water level measurements were referenced to the surveyed V-notch elevation at the top of the PVC well casing.

By subtracting the measured depth to water from the wellhead elevation in each monitoring well, the groundwater elevation was calculated at each monitoring point. The site's water table elevation map was produced by using the surveyed monitoring well coordinates and contouring the corresponding groundwater elevation data. The direction of groundwater flow is inferred to be perpendicular to (equipotential) contours. The site's groundwater gradient was determined using groundwater elevations from monitoring wells MW-1 and MW-7.

For the Fourth Quarter 2000 monitoring event, the groundwater gradient was determined to be 0.023 ft/ft towards the west. Historical depth to water and groundwater elevation data are presented on Table 1. The Fourth Quarter 2000 water table elevation contour map with the groundwater flow direction indicated is presented on Figure 3.

3.2. GROUNDWATER PURGING

Prior to collecting a groundwater sample from each monitoring well, approximately four well casing volumes of water were removed or the well casing was purged dry. The well was allowed to recharge to 80-percent of the pre-purging well casing water volume. Either a peristaltic pump or hand bailing with a 1-liter Teflon bailer was used to purge groundwater from each monitoring well casing. Water quality parameters (pH, oxidation-reduction potential [ORP], temperature and visual turbidity) were recorded onto field sampling data sheets prior to purging and after removing each well casing volume of water.

Field logs documenting water level measurements, well purging and sampling for the Fourth Quarter 2000 monitoring event are presented in Appendix A. Groundwater purged from monitoring wells during sampling was stored onsite in sealed, labeled, USDOT approved 55-gallon drums.

3.3. GROUNDWATER SAMPLING

Groundwater samples for laboratory analyses were retrieved using a disposable bailer and transferred into appropriately sized and preserved laboratory supplied sample containers. Sample containers were sealed, labeled with identifying information, logged onto the chain-of-custody, and temporarily stored in a chilled ice-chest while awaiting transportation to the laboratory.

3.4. LABORATORY ANALYSES

Groundwater samples were submitted for laboratory analyses to the State of California certified to Curtis and Tompkins Laboratories of Berkeley, California. The samples were analyzed by one or more of the following United States Environmental Protection Agency (USEPA) approved analytical methods:

- USEPA Method 8015M for Total Petroleum Hydrocarbons as Gasoline (TPH-g)
- USEPA Method 8020 for Aromatic Hydrocarbons (Benzene, Toluene, Ethylbenzene, and total Xylenes [BTEX]), and

- USEPA Method 8010 for Purgeable Halocarbons.

Certified analytical data sheets and chain-of-custody documentation from the Fourth Quarter 2000 groundwater sampling event are presented in Appendix B. A summary of historical groundwater monitoring well analytical results are presented in Table 2.

In addition, to verify previous results to characterize site condition for the potential bio-treatment remedial option, select groundwater samples were submitted to Curtis and Tompkins Laboratories of Berkeley, California, for the following inorganic analyses:

- EPA Method 300.0 for Nitrogen Compounds - Nitrate (NO_3^-), Nitrite (NO_2^-).
- EPA Method 300.0 for Orthophosphate (PO_4^{3-}),

The laboratory data sheets for inorganic chemistry and bacteriological count data are presented in Appendix B, and the data has been summarized and presented in Table 3.

4. CONCLUSION

The groundwater monitoring results obtained for the Fourth Quarter 2000 are similar to previous quarterly results. The groundwater gradient was determined to be 0.023 ft/ft to the west.

The highest concentrations of TPH-g and benzene occur ~~in the~~ beneath the central portion of the subject building in the area of monitoring well MW-2 and MW-3. The variation in BTEX and TPH-g concentration between quarterly monitoring events occurs due to dilution and absorption affects within the "smear zone" as the groundwater level rises and falls beneath the site. The locations of monitoring wells MW-6 and MW-7 define the eastern and northern edge of the hydrocarbon plume.

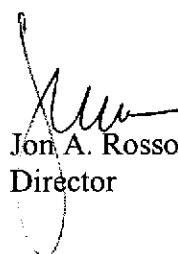

Chlorinated volatile organic compounds TCE, cis-1,2-DCE, trans-1,2-DCE and VC were detected in monitoring well MW-8, only. The distribution of the former fuel additive 1,2-DCA appears to be associated with the petroleum hydrocarbon release.

The bio-assessment data collected during this event confirms that groundwater beneath the site is anaerobic (oxygen-poor) and depleted in nitrogen and phosphate compounds.

Sincerely,

Warren B. Chamberlain, R.G., C.HG., P.E.
