Subject: Third Quarter 2003 Groundwater Monitoring Results for the property at
630 29th Avenue in Oakland, California

Dear Mr. Gholami:

Clayton is pleased to present the results for the Third Quarter 2003 groundwater monitoring event performed at 630 29th Avenue in Oakland, California.

If you have any comments or questions regarding the report please contact the undersigned at (925) 426-2600.

Sincerely,

Michael P. Krzeminski

1. INTRODUCTION

Clayton Group Services, Inc., (Clayton) has prepared this quarterly groundwater monitoring report to document the results of the Third Quarter, 2003 groundwater monitoring event for the former Lemoine Sausage Facility located at 630 29th Avenue in Oakland, California (Figure 1). The groundwater monitoring is performed pursuant a request from the Alameda County Health Services (ACHS) in a letter dated June 19, 1999. Groundwater monitoring is required due to past releases from a former gasoline underground storage tank (UST) previously located beneath the sidewalk adjacent to the subject property. The purpose of the groundwater monitoring is to determine groundwater flow conditions and water quality beneath the site. Groundwater samples are collected and analyzed for Total Petroleum Hydrocarbons as Gasoline (TPH-g) and associated compounds Benzene, Toluene, Ethylbenzene and total Xylenes (BTEX) and the former gasoline fuel additive 1,2-Dichloroethane (1,2-DCA).

As directed by the ACHS, groundwater monitoring is being performed on a quarterly basis. This Third Quarter 2003 Groundwater Monitoring Report documents field activities, and presents data used to determine the groundwater elevation and gradient at the site. Laboratory data are presented and indicate the groundwater concentrations of dissolved hydrocarbons in the vicinity of the subject property.

2. SITE DESCRIPTION AND HISTORY

A single 1,000-gallon gasoline UST and associated plumbing/piping were formerly located beneath the sidewalk of 7th Street and adjacent (east) of the subject property building. The associated fuel dispenser was located in a "cubby hole" near the building's roll-up door. The UST and associated piping were removed on November 21, 1996 and confirmation soil samples were collected. A petroleum hydrocarbon sheen was noted on top of groundwater and petroleum hydrocarbons were detected in the confirmation soil samples collected at the time of the UST removal.

Subsequent groundwater investigations were performed and eight groundwater monitoring wells have been installed into the first encountered water bearing zone to test groundwater conditions at the site. The locations of the monitoring wells were selected to define the vertical and lateral extent of petroleum hydrocarbons within groundwater at the site. First encountered water beneath the site occurs in predominantly low permeability clayey and sandy silt, at depths ranging from 3.5 to 8.5 feet below street grade.

In addition, during the testing for 1,2-DCA, several non-gasoline related halogenated volatile organic compounds (VOCs) were detected in the groundwater samples from wells located in the southern portion of the site. The source of non-gasoline related VOCs has not been discerned, and are mostly likely due to an off-site source.

3. GROUNDWATER MONITORING FIELD ACTIVITIES

The following discussion describes field methods used to obtain depth to water measurements, and collect groundwater samples. Field activities were performed on September 26, 2003. Groundwater samples were collected from ten monitoring wells (MW-1, MW-2, MW-6, MW-7, MW-8, MW-9, MW-10, MW-11, MW-12 and MW-13).

3.1. GROUNDWATER LEVEL MEASUREMENTS

Depth to water was measured in each monitoring well to determine the groundwater elevation, gradient and flow direction. The depth to water in each monitoring well was measured on September 26, 2003, with an electronic water level probe. The depth to water in each monitoring well was measured from the surveyed reference elevation represented as a V-notch at the top of the well casing (TOC) to the water surface within the well casing. By subtracting the measured depth to water from the TOC elevation in each monitoring well, the groundwater elevation at each monitoring point was calculated.

3.2. GROUNDWATER PURGING

Two monitoring wells (MW-1 and MW-2) are constructed with $\frac{3}{4}$ -inch diameter PVC well casings and eight monitoring wells (MW-6 through MW-13) are constructed with 2-inch diameter PVC well casings. Prior to collecting a groundwater sample from each monitoring well, approximately four well casing volumes of water were removed or the well casing was purged dry. The $\frac{3}{4}$ -inch diameter wells were purged using a peristaltic pump and $\frac{1}{4}$ -inch polytubing, and the 2-inch diameter wells were purged by a submersible pump, or by hand bailing with a 1-liter Teflon bailer attached to nylon bailer twine. Water quality parameters (pH, specific conductivity, and temperature) were measured and recorded onto field sampling data sheets. Water quality parameter measurements were taken prior to purging and after removing each well casing volume of water from the monitoring well.

The purge volume from each monitoring well was determined from multiplying the nominal cross-sectional area of the well casing by the water column within each well casing. The water column height in each well was determined from subtracting the groundwater elevation from the well casing bottom elevation (known from well construction details).

Field logs documenting water level measurements and well purging and sampling for the Third Quarter 2003 monitoring event are presented in Appendix A. Groundwater purged from monitoring wells during sampling was stored onsite in sealed USDOT approved 55-gallon drums, labeled with identifying information, manifested and removed from the site by a licensed hauler.

3.3. GROUNDWATER SAMPLING

Prior to collecting a groundwater sample from each monitoring well, the well was allowed to recharge to 80-percent of the pre-purged well casing water volume. Groundwater samples for laboratory analyses were retrieved using either a peristaltic

pump with polytubing or a disposable bailer. The groundwater retrieved for analyses was transferred into appropriately sized and preserved laboratory supplied containers. Sample containers were sealed, labeled with identifying information, logged onto the chain-of-custody, and temporarily stored in a chilled ice-chest while awaiting transportation to the laboratory.

3.4. LABORATORY ANALYSES

Groundwater samples were submitted to the State of California certified Curtis and Tompkins Laboratories of Berkeley, California for laboratory analyses. The samples were analyzed by one or more of the following United States Environmental Protection Agency (USEPA) approved analytical methods:

- USEPA Method 8015B for Total Petroleum Hydrocarbons as Gasoline (TPH-g)
- USEPA Method 8021B for Aromatic Hydrocarbons (Benzene, Toluene, Ethylbenzene, and total Xylenes [BTEX]), and
- USEPA Method 8260B for Halogenated Volatile Organic Compounds (VOCs).

Certified analytical data sheets and chain-of-custody documentation for the Third Quarter 2003 groundwater-sampling event are presented in Appendix B.

4. FINDINGS

The following discussion presents an interpretation of groundwater flow conditions and water quality at the site based on the results obtained from field measurements and laboratory analyses.

4.1. GROUNDWATER FLOW CONDITIONS

A site piezometric surface (water table) map was produced by using the surveyed monitoring well coordinates and contouring the corresponding groundwater elevation data. The magnitude of the local groundwater gradient was determined using groundwater elevations from monitoring wells MW-10 and MW-13. The direction of groundwater flow is inferred to be perpendicular to the piezometric equipotential contours. For the Third Quarter 2003 monitoring event, the groundwater gradient was determined to be 0.013 feet per foot (ft/ft) towards the southwest.

Historical depth to water measurements and groundwater elevation data are presented on Table 1. The Third Quarter 2003 groundwater elevation contour map with the groundwater flow direction indicated is presented on Figure 2.

4.2. PETROLEUM AND AROMATIC HYDROCARBONS

The frequency and range of petroleum hydrocarbons detected in groundwater samples are as follows:

- TPH-g was detected in 6 of 10 samples tested, and ranged in concentration from 230 micrograms per liter ($\mu\text{g}/\text{L}$) to 34,000 $\mu\text{g}/\text{L}$.
- Benzene was detected in 7 of 10 samples tested, and ranged in concentration from 1.2 $\mu\text{g}/\text{L}$ to 12,000 $\mu\text{g}/\text{L}$.
- Toluene was detected in 6 of 10 samples tested, and ranged in concentration from 0.69 $\mu\text{g}/\text{L}$ to 5,600 $\mu\text{g}/\text{L}$.
- Ethylbenzene was detected in 6 of 10 samples tested, and ranged in concentration from 3.8 $\mu\text{g}/\text{L}$ to 960 $\mu\text{g}/\text{L}$.
- Total Xylenes was detected in 6 of 10 samples tested, and ranged in concentration from 0.85 $\mu\text{g}/\text{L}$ to 4,700 $\mu\text{g}/\text{L}$.

A summary of petroleum hydrocarbons and VOCs detected in groundwater samples are presented on Table 2. The concentrations of TPH-g and benzene detected in groundwater samples collected from monitoring wells for the Third Quarter 2003 monitoring event are presented in Figures 3a and 3b, respectively.

4.3. HALOGENATED VOLATILE ORGANIC COMPOUNDS

The frequency and range of VOCs detected in groundwater samples are as follows:

- 1,2-Dichloroethane (1,2-DCA) was detected in 1 of 10 samples tested, at a concentration of 0.7 $\mu\text{g}/\text{L}$.
- Trichloroethene (TCE) was detected in 3 of 10 samples tested, and ranged in concentration from 20 $\mu\text{g}/\text{L}$ to 210 $\mu\text{g}/\text{L}$.
- Cis 1,2-Dichloroethene (cis 1,2-DCE) was detected in 3 of 10 samples tested, and ranged in concentration from 60 $\mu\text{g}/\text{L}$ to 890 $\mu\text{g}/\text{L}$.
- Trans 1,2-Dichloroethene (trans 1,2-DCE) was detected in 3 of 10 samples tested, and ranged in concentration from 23 $\mu\text{g}/\text{L}$ to 63 $\mu\text{g}/\text{L}$.
- Vinyl Chloride (VC) was detected in 2 of 10 samples tested, and ranged in concentration from 5.1 $\mu\text{g}/\text{L}$ to 47 $\mu\text{g}/\text{L}$.

The concentrations of TCE (contoured) and 1,2-DCE detected in groundwater samples collected from monitoring wells for the Third Quarter 2003 monitoring event are presented in Figure 4.

5. CONCLUSION

The groundwater gradient determined for the Third Quarter 2003 monitoring event was found to be 0.013 ft/ft to the southwest, and is consistent with past determinations. The highest concentrations of TPH-g and benzene occur beneath the central portion of the subject building in the area of monitoring wells MW-1, MW-2 and MW-9. The locations of monitoring wells MW-6, MW-7 and MW-10 define the northern, western, and

northeastern edge of the hydrocarbon plume. The distribution of the former gasoline fuel additive 1,2-DCA appears to be associated with the petroleum hydrocarbon release.

The concentrations of TPH-g have decreased in groundwater across the site from the concentrations detected in the previous sampling event, with the exception of wells MW-2 and MW-12, which showed a slight increase in concentrations. Additionally, the highest concentrations of BTEX compounds (found in wells MW-1, MW-2, MW-8, and MW-9) either maintained or slightly decreased from those detected in the previous sampling event. Concentrations of these compounds in the down gradient wells (MW-7, MW-11, MW-12, and MW-13) have either maintained or slightly increased from the concentrations detected in the previous sampling event.

Non gasoline related chlorinated volatile organic compounds TCE, cis-1,2-DCE, trans-1,2-DCE and VC were detected in groundwater samples collected from monitoring wells MW-8, MW-12, and MW-13. The concentrations in these wells are consistent with those detected in the previous sampling event. The source of TCE and 1,2-DCE are unknown and appear to be originating off-site.

Notes:

- All results in micrograms per liter ($\mu\text{g/L}$).
- NA = Not Analyzed.
- NS = Not Sampled
- 1,2-DCA = 1,2-dichloroethane.
- TPHG = Total Petroleum Hydrocarbons as Gasoline.

- MTBE = methyl tert-butyl ether.
- TCE = Trichloroethene.
- DCE = Dichloroethene.
- VC= Vinyl Chloride.

^{*1} 1,1-DCA detected at 1.1 $\mu\text{g/L}$.

^{*2} 1,1-DCA detected at 0.9 $\mu\text{g/L}$.

^{*3} Freon -11 detected at 0.6 $\mu\text{g/L}$.

^{*4} 1,1-DCA detected at 0.9 $\mu\text{g/L}$.

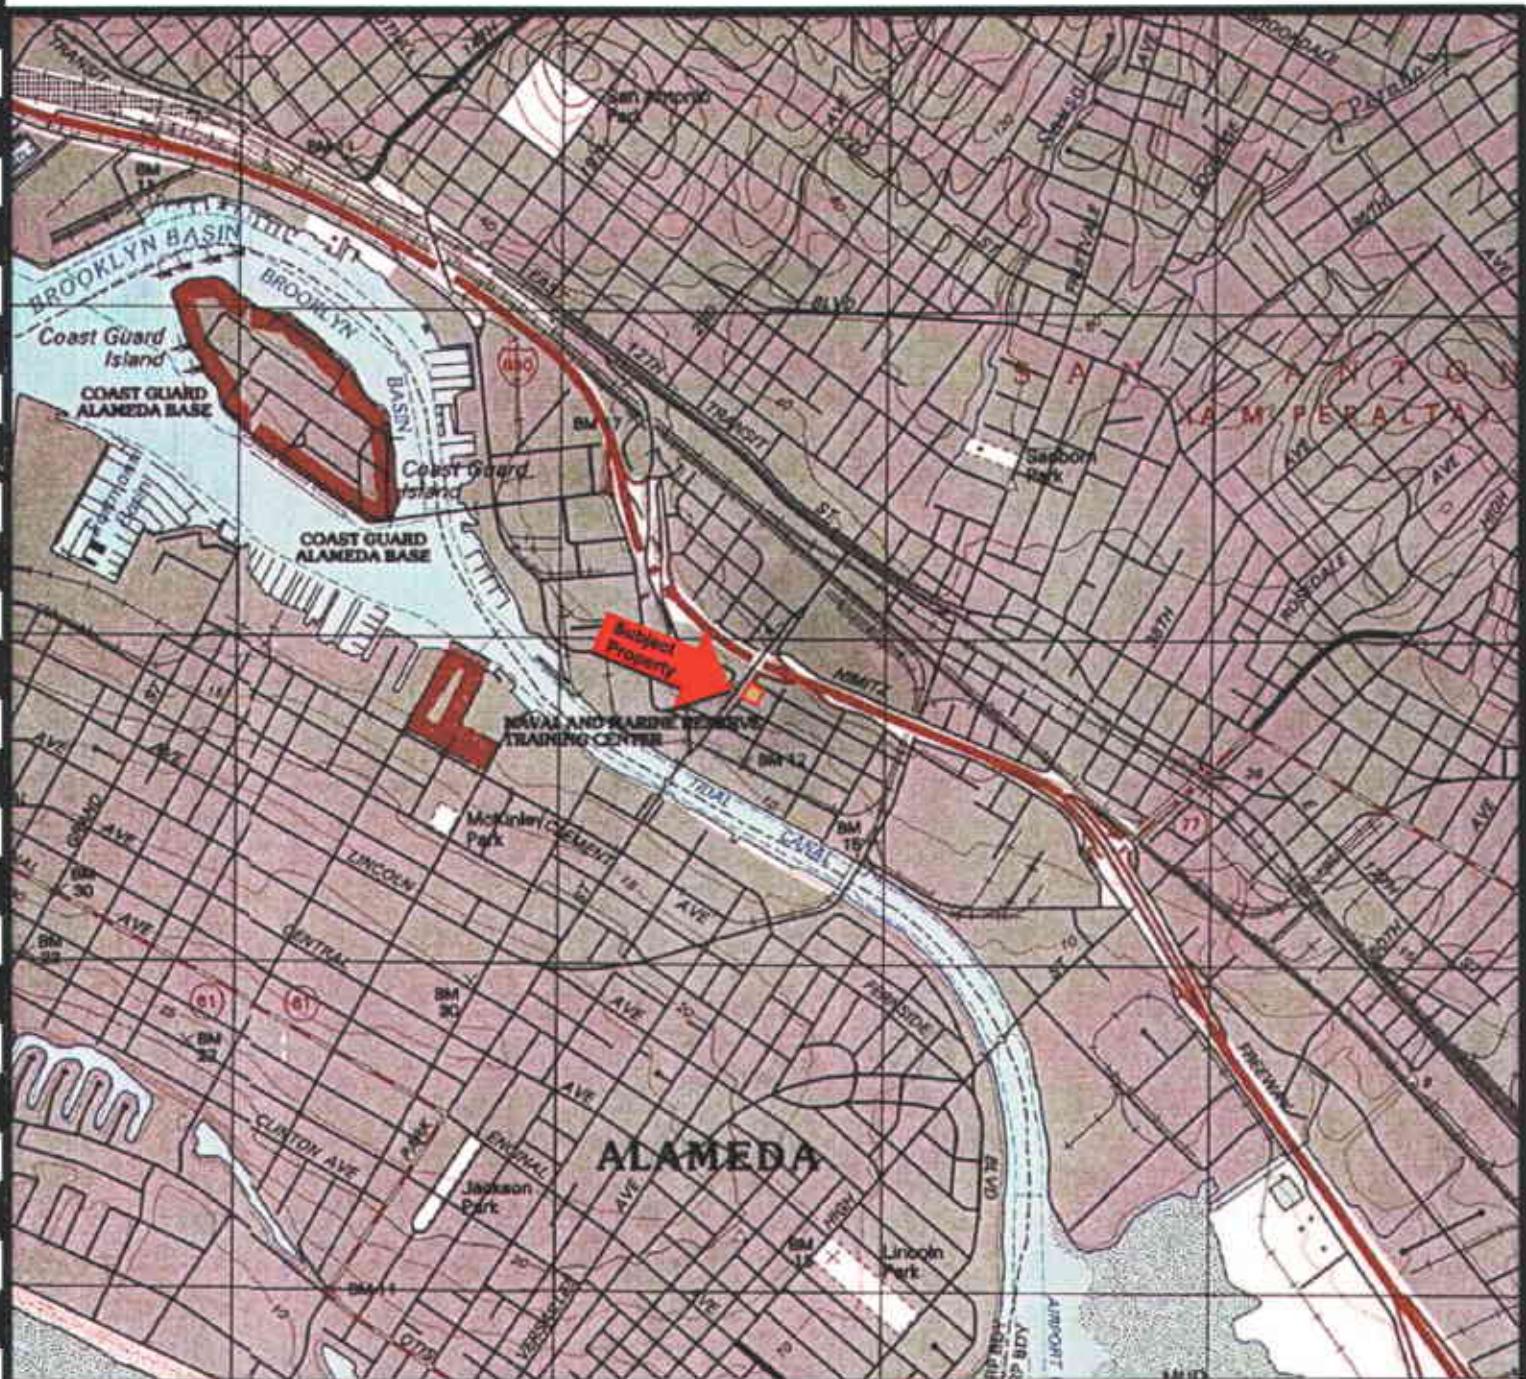

^{*5} 1,1-DCA detected at 0.7 $\mu\text{g/L}$.

^{*6} 1,1-DCE detected at 4.7 $\mu\text{g/L}$.

^{*7} 1,1-DCE detected at 5.2 $\mu\text{g/L}$.

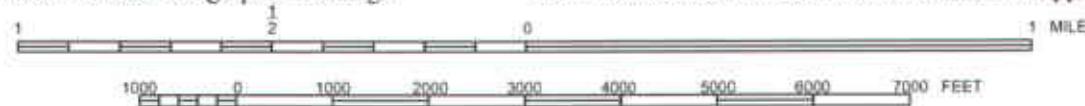

^{*8} 1,1-DCE detected at 1.9 $\mu\text{g/L}$.

^{*9} 1,1-DCE detected at 2.8 $\mu\text{g/L}$.

CASE NARRATIVE

This hardcopy data package contains sample results and batch QC results for ten water samples received from the above referenced project. The samples were received cold and intact.

Total Volatile Hydrocarbons (TVH)/BTXE: The TVH surrogate recoveries for sample MW-13 03Q3 (167821-010) were above acceptance limits due to coelution of the surrogate peaks with hydrocarbon peaks. The TVH bromofluorobenzene surrogate recoveries were also outside acceptance limits for the matrix spikes from batch number 84890.

Volatile Organic Compounds: No analytical problems were encountered.
