Subject: Second Quarter 2004 Groundwater Monitoring Results for the property at
630 29th Avenue in Oakland, California

Dear Mr. Gholami:

Clayton is pleased to present the results for the Second Quarter 2004 groundwater monitoring event performed at 630 29th Avenue in Oakland, California.

If you have any comments or questions regarding the report please contact Clayton at
(925) 426-2600.

Sincerely,

1.0 INTRODUCTION

Clayton Group Services, Inc., (Clayton) has prepared this quarterly groundwater monitoring report to document the results of the Second Quarter 2004 groundwater monitoring event for the former Lemoine Sausage Facility located at 630 29th Avenue in Oakland, California (Figure 1). The groundwater monitoring is performed pursuant to a request from the Alameda County Environmental Health (ACEH) in a letter dated June 19, 1999. Groundwater monitoring is required due to past releases from a former gasoline underground storage tank (UST) previously located beneath the sidewalk adjacent to the subject property. The purpose of the groundwater monitoring is to determine groundwater flow conditions and water quality beneath the site. Groundwater samples are collected and analyzed for total petroleum hydrocarbons as gasoline (TPH-g) and associated compounds benzene, toluene, ethylbenzene and total xylenes (BTEX), and the former gasoline fuel additive 1,2-Dichloroethane (1,2-DCA).

As directed by the ACEH, groundwater monitoring is being performed on a quarterly basis. This Second Quarter 2004 Groundwater Monitoring Report documents field activities, and presents data used to determine the groundwater elevation and gradient at the site. Laboratory data presented in this report indicate the groundwater concentrations of dissolved hydrocarbons in the vicinity of the subject property.

2.0 SITE DESCRIPTION AND HISTORY

A single 1,000-gallon gasoline UST and associated plumbing/piping were formerly located beneath the sidewalk of 7th Street adjacent (east) to the subject property building. The associated fuel dispenser was located in a "cubby hole" near the building's roll-up door. The UST and associated piping were removed on November 21, 1996 and confirmation soil samples were collected. A petroleum hydrocarbon sheen was noted on groundwater that collected in the tank excavation and petroleum hydrocarbons were detected in the confirmation soil samples collected at the time of the UST removal.

Subsequent groundwater investigations were performed and monitoring well locations selected to define the vertical and lateral extent of petroleum hydrocarbons within groundwater. Ten (10) groundwater monitoring wells currently exist in the first encountered water bearing zone to test groundwater conditions at and near the site. First encountered water beneath the site occurs in predominantly low permeability clayey and sandy silt, at depths ranging from 3.5 to 8.5 feet below street grade.

During testing for 1,2-DCA, several non-gasoline related halogenated volatile organic compounds (VOCs) were detected in the groundwater samples from wells located in the southern portion of the site. The source of non-gasoline related VOCs, which has not been identified, is most likely off-site.

3.0 GROUNDWATER MONITORING FIELD ACTIVITIES

The following discussion describes field methods used to obtain depth to water measurements and collect groundwater samples. Groundwater samples were collected from 10 monitoring wells (MW-1, MW-2, MW-6, MW-7, MW-8, MW-9, MW-10, MW-11, MW-12 and MW-13).

3.1. GROUNDWATER LEVEL MEASUREMENTS

Depth to water was measured in each of the 10 monitoring wells to determine the groundwater elevation, gradient and flow direction. Using an electronic water level probe, the depth to water in each well was measured from the surveyed reference elevation represented as a V-notch at the top of the casing (TOC) to the water surface within the well casing. By subtracting the measured depth to water from the TOC elevation in each monitoring well, the groundwater elevation at each monitoring point was calculated.

3.2. GROUNDWATER PURGING

Two monitoring wells (MW-1 and MW-2) are constructed with $\frac{3}{4}$ -inch diameter PVC well casings and eight monitoring wells (MW-6 through MW-13) are constructed with 2-inch diameter PVC well casings. Prior to collecting a groundwater sample from each monitoring well, approximately four well casing volumes of water were removed or the well casing was purged dry. The $\frac{3}{4}$ -inch diameter wells were purged using a peristaltic pump and $\frac{1}{4}$ -inch polytubing, and the 2-inch diameter wells were purged by hand bailing with a 1-liter Teflon bailer. Water quality parameters (pH, specific conductivity, and temperature) were measured and recorded onto field sampling data sheets. Water quality parameter measurements were taken prior to purging and after removing each well casing volume of water from the monitoring well.

The purge volume from each monitoring well was determined by multiplying the nominal cross-sectional area of the well casing by the water column within each well casing. The water column height in each well was determined by subtracting the depth to water from the well casing depth (reported in well construction details).

Field logs documenting water-level measurements and well purging and sampling for the Second Quarter 2004 monitoring event are presented in Appendix A. Groundwater purged from monitoring wells during sampling was stored onsite in sealed 55-gallon drums meeting U.S. Department of Transportation (USDOT) regulations and labeled with identifying information. The waste was later manifested and removed from the site by a licensed hauler as hazardous waste.

3.3. GROUNDWATER SAMPLING

Prior to collecting a groundwater sample from each monitoring well, the well casing was allowed to recharge to 80-percent of the pre-purged water volume. Groundwater samples for laboratory analyses were retrieved using either a peristaltic pump with polytubing or a new disposable bailer. The groundwater retrieved for analyses was transferred into appropriately sized and preserved laboratory supplied containers. Sample containers

were sealed, labeled with identifying information, logged onto the chain-of-custody, and temporarily stored in a chilled ice-chest while awaiting transportation to the laboratory.

3.4. LABORATORY ANALYSES

Groundwater samples were submitted for analysis to State of California certified laboratory Curtis and Tompkins, Ltd., Analytical Laboratories of Berkeley, California. The samples were analyzed by one or more of the following United States Environmental Protection Agency (USEPA) approved analytical methods:

- USEPA Method 8015B for Total Petroleum Hydrocarbons as Gasoline (TPH-g)
- USEPA Method 8021B for Aromatic Hydrocarbons (Benzene, Toluene, Ethylbenzene, and total Xylenes)
- USEPA Method 8260B for Halogenated Volatile Organic Compounds (VOCs)

Certified analytical data sheets and chain-of-custody documentation for the Second Quarter 2004 groundwater-sampling event are presented in Appendix B.

4.0 FINDINGS

The following discussion presents an interpretation of groundwater flow conditions and water quality at the site based on the results obtained from field measurements and laboratory analyses.

4.1. GROUNDWATER FLOW CONDITIONS

A groundwater elevation contour (water table) map was produced by using the surveyed monitoring well coordinates to produce contouring lines of equal elevation using the groundwater elevation data points for this monitoring event. The magnitude of the local groundwater gradient was determined using groundwater elevations from monitoring wells MW-1 and MW-12. The direction of groundwater flow is inferred to be perpendicular to the piezometric equipotential contours. For the Second Quarter 2004 monitoring event, the groundwater gradient was determined to be 0.013 feet per foot (ft/ft) towards the west-southwest.

Historical depth to water measurements and groundwater elevation data are presented in Table 1. The Second Quarter 2004 groundwater elevation contour map and the approximate groundwater flow direction is presented on Figure 2.

4.2. PETROLEUM AND AROMATIC HYDROCARBONS

The frequency and range of petroleum hydrocarbons detected in groundwater samples are as follows:

- TPH-g was detected in 7 of 10 samples that ranged in concentration from 63 micrograms per liter ($\mu\text{g/L}$) to 53,000 $\mu\text{g/L}$.

- Benzene was detected in 5 of 10 samples that ranged in concentration from 140 µg/L to 12,000 µg/L.
- Toluene was detected in 5 of 10 samples that ranged in concentration from 2.9 µg/L to 2,600 µg/L.
- Ethylbenzene was detected in 5 of 10 samples that ranged in concentration from 88 µg/L to 1,100 µg/L.
- Total xylene was detected in 5 of 10 samples that ranged in concentration from 1.5 µg/L to 4,800 µg/L.

A summary of petroleum hydrocarbons and VOCs detected in groundwater samples is presented in Table 2. The concentrations of TPH-g and benzene detected in groundwater samples and isoconcentration contours for the Second Quarter 2004 monitoring event are presented in Figures 3a and 3b, respectively.

4.3. HALOGENATED VOLATILE ORGANIC COMPOUNDS

The frequency and range of VOCs detected in groundwater samples are as follows:

- 1,2-Dichloroethane (1,2-DCA) was detected only in MW-6, at a concentration of 0.8 µg/L.
- Trichloroethene (TCE) was detected in 2 of 10 samples tested (MW-12 at 200 µg/L and MW-13 at 53 µg/L).
- Cis 1,2-Dichloroethene (cis 1,2-DCE) was detected in 3 of 10 samples tested (MW-8 at 1,300 µg/L, MW-12 at 65 µg/L, and MW-13 at 350 µg/L).
- Trans 1,2-Dichloroethene (trans 1,2-DCE) was detected in 3 of 10 samples tested (MW-8 at 50 µg/L, MW-12 at 74 µg/L, and MW-13 at 31 µg/L).
- Vinyl Chloride (VC) was detected in 2 of 10 samples tested (80 µg/L at MW-8 and 25 µg/L at MW-13).

The concentrations of TCE and cis 1,2-DCE detected were in groundwater samples for the Second Quarter 2004 monitoring event are presented in Figure 4.

5.0 CONCLUSION

The groundwater gradient determined for the Second Quarter 2004 monitoring event was found to be relatively consistent with past determinations. TPH-g and BTEX in groundwater are within observed historic concentration ranges. The highest concentrations of TPH-g and benzene occur in monitoring wells MW-2 and MW-9, beneath the central portion of the subject building just downgradient of the former UST location. The locations of monitoring wells MW-6, MW-7 and MW-10 define the northern, western, and eastern edge of the hydrocarbon plume.

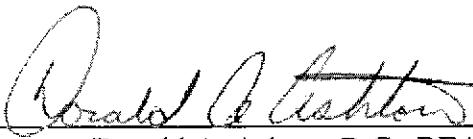

Chlorinated volatile organic compounds (not a component of gasoline) found in downgradient monitoring well samples (wells MW-8, MW-13, and MW-12) but not near the former UST location, include TCE and its associated degradation compounds of cis-1,2-DCE, trans-1,2-DCE, and VC. These chlorinated compounds appear to be relatively stable with some indications of natural degradation. The source of the chlorinated VOCs is unknown, appears to be originating off-site, and does not appear to be related to the gasoline release.

Notes:

1. All results in micrograms per liter ($\mu\text{g}/\text{L}$).
2. NA = Not Analyzed.
3. NS = Not Sampled
4. 1,2-DCA = 1,2-dichloroethane.
5. TPHG = Total Petroleum Hydrocarbons as Gasoline.

6. MTBE = methyl tert-butyl ether.
7. TCE = Trichloroethene.
8. DCE = Dichloroethene.
9. VC= Vinyl Chloride.

^{*1} 1,1-DCA detected at 1.1 $\mu\text{g}/\text{L}$.

^{*2} 1,1-DCA detected at 0.9 $\mu\text{g}/\text{L}$.

^{*3} Freon -11 detected at 0.6 $\mu\text{g}/\text{L}$.

^{*4} 1,1-DCA detected at 0.9 $\mu\text{g}/\text{L}$.

^{*5} 1,1-DCA detected at 0.7 $\mu\text{g}/\text{L}$.

^{*6} 1,1-DCE detected at 4.7 $\mu\text{g}/\text{L}$.

^{*7} 1,1-DCE detected at 5.2 $\mu\text{g}/\text{L}$.

^{*8} 1,1-DCE detected at 1.9 $\mu\text{g}/\text{L}$.

^{*9} 1,1-DCE detected at 2.8 $\mu\text{g}/\text{L}$.

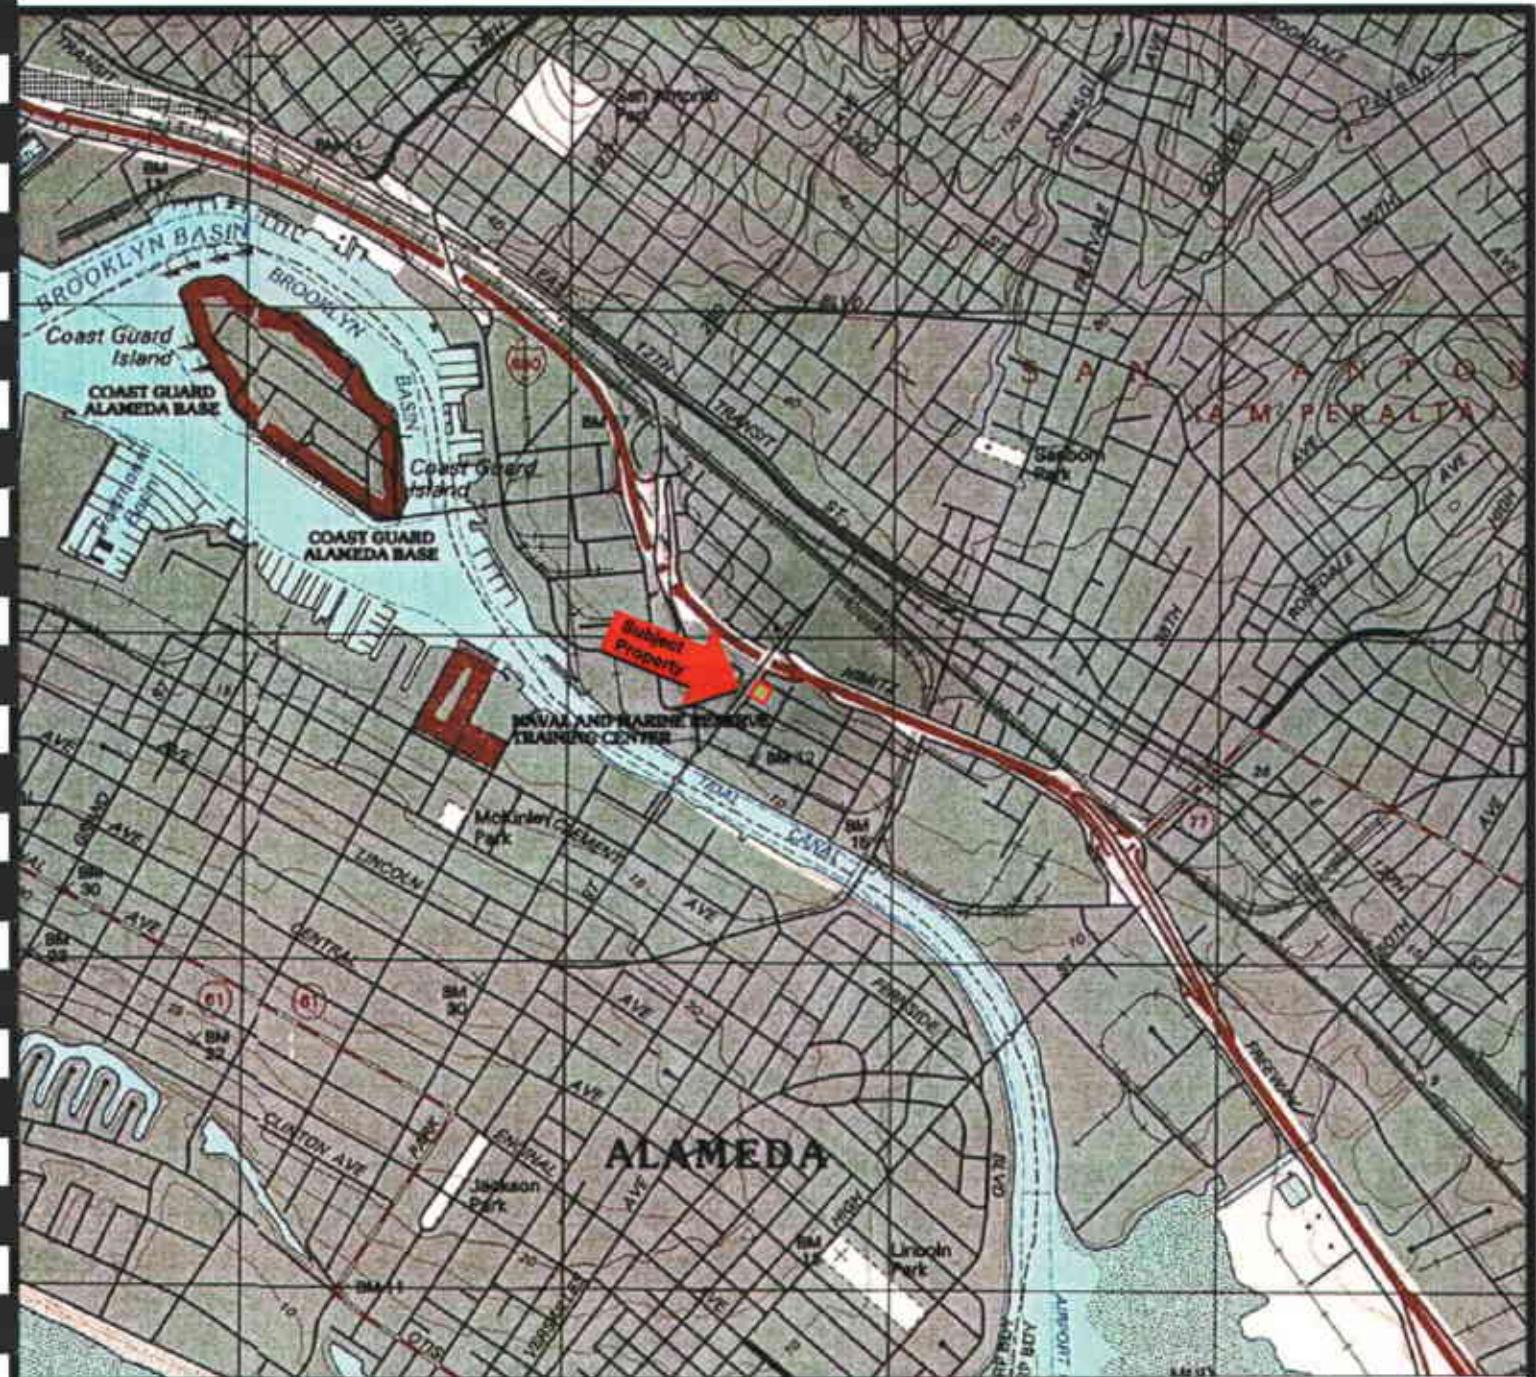

^{*10} 1,1-DCE detected at 1.8 $\mu\text{g}/\text{L}$.

^{*11} 1,1-DCE detected at 1.1 $\mu\text{g}/\text{L}$.

^{*12} 1,1-DCA detected at 0.5 $\mu\text{g}/\text{L}$.

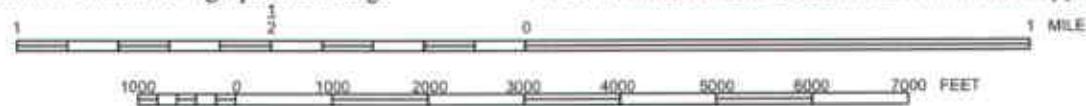

^{*13} 1,1-DCE detected at 0.8 $\mu\text{g}/\text{L}$.

^{*14} 1,1-DCE detected at 2.8 $\mu\text{g}/\text{L}$.

Project ID: 70-04578.00
Location: Sausage Factory

This data package has been reviewed for technical correctness and completeness. Release of this data has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signatures. The results contained in this report meet all requirements of NELAC and pertain only to those samples which were submitted for analysis.

CASE NARRATIVE

This hardcopy data package contains sample and QC results for ten water samples that were received on June 23rd, 2004. The samples were received cold and intact.

Gasoline and BTXE by EPA 8015B/8021B: High surrogate recoveries were observed for Trifluorotoluene and Bromofluorobenzene in sample MW-13 C&T#173038-010 due to coelution with the hydrocarbons peaks. High surrogate recovery was observed for Trifluorotoluene in the LCS and matrix spike (MW-07, C&T#173038-004) due to coelution with the gasoline standard. No other analytical problems were encountered.

Purgeable Halocarbons by GC/MS EPA 8260B: No analytical problems were encountered.
