Subject: **Fourth Quarter 2007 Groundwater Monitoring Report**
Former Lemoine Sausage Factory
630 29th Avenue
Oakland, California

Dear Ms. Drogos:

Bureau Veritas North America, Inc., formerly Clayton Group Services (Bureau Veritas) is pleased to present the results of the Fourth Quarter 2007 groundwater monitoring event performed at the Former Lemoine Sausage Factory, located at 630 29th Avenue in Oakland, California.

I declare, under penalty of perjury, that the information and/or recommendations contained in this attached report are true and correct to the best of my knowledge and belief. If you have any comments or questions regarding the report, please do not hesitate to contact Timothy Bodkin at (925) 426-2626.

Sincerely,

Jeremy V. Wilson
Environmental Consultant

1.0 INTRODUCTION

Bureau Veritas North America, Inc. (Bureau Veritas), formerly Clayton Group Services, has prepared the following Fourth Quarter 2007 Groundwater Monitoring Report for the former Lemoine Sausage Factory (the "Site"). The Site is located at 630 29th Avenue near its intersection with 7th Street in Oakland, California (Figure 1). Groundwater monitoring is being performed at the Site on a quarterly basis in accordance with an Alameda County Environmental Health (ACEH) directive dated June 19, 1999. Groundwater monitoring has been required due to a past release from an underground gasoline underground storage tank (UST).

The purpose of the groundwater monitoring is to document groundwater flow conditions and water quality beneath the Site. Depth to groundwater measurements were obtained and groundwater samples were collected and analyzed for total petroleum hydrocarbons as gasoline (TPH-g) and associated compounds, including benzene, toluene, ethylbenzene and total xylenes (BTEX), and volatile organic compounds (VOCs).

2.0 SITE DESCRIPTION AND HISTORY

A single 1,000-gallon gasoline UST and associated plumbing/piping were formerly located beneath the sidewalk along 7th Street immediately east of the subject building. The fuel dispenser for the UST was located in a "cubby hole" near the building's roll-up door. The UST, fuel dispenser, and associated piping were removed on November 21, 1996. Confirmation soil samples were collected from the excavation for laboratory analyses. A petroleum hydrocarbon sheen was noted on the groundwater surface within the tank excavation. Analytical results for the confirmation samples showed the presence of petroleum hydrocarbons.

Subsequent groundwater investigations were performed to define the vertical and lateral extent of petroleum hydrocarbons in groundwater and to monitor groundwater conditions around the Site. Several monitoring wells were installed and screened within the first-encountered water bearing zone, which predominantly occurs within low permeability clayey and sandy silts. The highest concentrations of TPH-g and benzene have been detected in the immediate vicinity or just downgradient of the former UST. VOCs have also been detected in monitoring wells located to the south and southwest of the former UST location and are believed to originate from an off-site source.

3.0 FIELD ACTIVITIES

Groundwater level measurements and samples were obtained from ten (10) existing monitoring wells (MW-1, MW-2, and MW-6 through MW-13).

3.1. GROUNDWATER LEVEL MEASUREMENTS

On December 19, 2007, depth to water measurements were obtained in the monitoring wells to calculate groundwater elevations and to estimate the groundwater flow direction and gradient. The wells were opened and allowed to stabilize prior to measuring the groundwater levels. The depth to water in each well was measured using an electronic well sounder. Groundwater depths were measured from a surveyed reference elevation point represented by a V-notch at the top of each

casing. Groundwater elevations were calculated by subtracting the measured depth to water from the top of casing elevation at each monitoring well.

3.2. GROUNDWATER PURGING

Prior to groundwater sample collection at each monitoring well, between three and six well casing volumes of standing water were removed with the exception of Wells MW-1 and MW-2, which were not purged because of the lack of sufficient water within the wells and poor groundwater recharge after purging. Wells MW-6 through MW-13 were purged by hand bailing with 1-liter plastic disposable bailers.

The purge volume from each monitoring well was determined by multiplying the nominal cross-sectional area of the well casing by the water column within each well casing. The water column height in each well was determined by subtracting the depth to water from the total well casing depth. Water quality parameters (pH, specific conductivity, and temperature) were measured and recorded onto Field Sampling Data Sheets. Water quality parameter measurements were taken prior to purging and after removing each well casing volume of water from each monitoring well.

Groundwater purged from monitoring wells was stored onsite in sealed 55-gallon drums and labeled with identifying information. Groundwater level measurements for the Fourth Quarter 2007 monitoring event were recorded on Field Sampling Data Sheets, as presented in Appendix A.

3.3 GROUNDWATER SAMPLING

Before groundwater sampling commenced, each purged monitoring well was allowed to recharge to at least 80% of the pre-purged standing water volume, except for Wells MW-1 and MW-2 for the reasons stated above. Groundwater samples for laboratory analyses were retrieved using either a peristaltic pump equipped with polytubing or a new disposable bailer. Groundwater samples were poured into appropriate laboratory-supplied containers. Sample containers were sealed, labeled with identifying project information, logged onto a chain-of-custody document, and temporarily stored in a chilled ice chest containing crushed ice for transport to the laboratory.

3.4 LABORATORY ANALYSES

Groundwater samples were analyzed by Curtis and Tompkins Ltd. of Berkeley, California, a State of California-certified laboratory. The samples were analyzed by the following United States Environmental Protection Agency (USEPA) approved analytical methods:

- USEPA Method 8021B for TPH-g/BTEX
- USEPA Method 8260B for VOCs

Certified analytical data sheets and chain-of-custody documentation for the Fourth Quarter 2007 groundwater sampling event are presented in Appendix B.

4.0 FINDINGS

4.1. GROUNDWATER FLOW CONDITIONS

Groundwater flow conditions were assessed based upon the groundwater level measurements obtained in the wells. Groundwater depths ranged between 5.21 and 10.71 feet below the tops of well casings. Groundwater elevations ranged between 8.02 and 11.71 feet above mean sea level. Groundwater flow is in a westerly direction at an estimated gradient of 0.015 feet per foot (ft/ft), as measured between Wells MW-10 and MW-13. Depth to water measurements and groundwater elevation data from this event and previous events are presented in Table 1. The Fourth Quarter 2007 groundwater elevation map is presented on Figure 2.

4.2. ANALYTICAL RESULTS

Analytical results for groundwater showed the presence of petroleum hydrocarbons and VOCs. The frequency and range of petroleum hydrocarbons and VOCs detected in groundwater during this quarter are as follows:

- TPH-g was detected in Wells MW-1, MW-2, MW-8, MW-9, MW-12, and MW-13 at concentrations ranging between 68 and 44,000 micrograms per liter ($\mu\text{g/L}$).
- Benzene was detected in Wells MW-1, MW-2, MW-7, MW-8, and MW-9, at concentrations ranging between 0.93 and 9,900 $\mu\text{g/L}$. This is the first detection of benzene in Well MW-7 since the First Quarter 2002 monitoring event.
- Toluene was detected in Wells MW-1, MW-2, MW-6, and MW-9 at concentrations ranging between 0.51 and 290 $\mu\text{g/L}$. This is the first detection of toluene in Well MW-6 since the Fourth Quarter 2002 monitoring event.
- Ethylbenzene was detected in Wells MW-1, MW-2, MW-8, MW-9, and MW-13 at concentrations ranging between 41 and 1,100 $\mu\text{g/L}$.
- Total xylenes were detected in Wells MW-1, MW-2, MW-6, MW-9, and MW-13 at concentrations ranging between 0.96 and 1,880 $\mu\text{g/L}$. This is the first detection of total xylenes in Well MW-6 since the First Quarter 2005 monitoring event.
- Trichloroethene (TCE) was detected in Wells MW-12 and MW-13 at concentrations of 140 and 21 $\mu\text{g/L}$, respectively.
- Cis-1,2-dichloroethene (cis-1,2-DCE) was detected in Wells MW-8, MW-12, and MW-13 at concentrations of 1,200, 55, and 77 $\mu\text{g/L}$, respectively.
- Trans-1,2-dichloroethene (trans-1,2-DCE) was detected in Wells MW-8, MW-12, and MW-13 at concentrations ranging between 36 and 61 $\mu\text{g/L}$.
- Vinyl chloride (VC) was detected in Wells MW-8 and MW-13 at concentrations of 150 and 10 $\mu\text{g/L}$, respectively.

Historical groundwater analytical results for petroleum hydrocarbons and VOCs detected in groundwater are presented in Table 2. TPH-g and benzene concentrations detected in groundwater and isoconcentration contours for these constituents detected during Fourth

Quarter 2007 are presented on Figures 3 and 4, respectively. TCE and cis-1,2-DCE concentrations detected in groundwater during Fourth Quarter 2007 are presented in Figure 5.

5.0 CONCLUSIONS

Groundwater conditions for Fourth Quarter 2007 are relatively consistent with the trends noted during previous monitoring events. TPH-g and BTEX concentrations detected in groundwater remain consistent within the same order of magnitude in comparison with the analytical results from previous events. TPH-g and benzene concentrations generally increased with the exception of Wells MW-9 and MW-13 where the benzene concentrations decreased and Well MW-12 where the TPH-g concentration slightly decreased. The highest concentrations of TPH-g and benzene were detected in Wells MW-2 and MW-9, which are both located within the central portion of the subject building downgradient of the former UST location. The lateral extent of the hydrocarbon plume is roughly defined by the concentrations detected in Wells MW-1, MW-6, MW-7, MW-10, MW-11, MW-12, and MW-13.

VOC concentrations detected in Wells MW-8, MW-12, and MW-13 during this monitoring event are similar with those concentrations detected during the previous event. The source of the VOCs in groundwater is unknown and appears to originate from an offsite source. On this basis, the VOC concentrations detected in groundwater are not related to the UST release. The presence of the various degradation compounds, as well as the changes in VOC concentrations over the past several monitoring events, indicate that degradation of the TCE is occurring. No additional investigation of the TPH- and VOC-impacted groundwater is recommended.

Notes:

1. All top of casing elevations referenced to mean sea level (msl) and surveyed with reference to the benchmark located at Peterson Street and East 7th Street.
2. NM refers to Not Measured.
3. ft, msl refers to feet above mean sea level.

DHS MCL	-	1	150	300	1,750	5	0.5	6	10	0.5	

Notes:

1. All results are reported in micrograms per liter ($\mu\text{g}/\text{L}$).
2. NA refers to Not Analyzed.
3. NS refers to Not Sampled.
4. TPH-g refers to Total Petroleum Hydrocarbons as Gasoline.
5. MTBE refers to Methyl tert-butyl ether.
6. TCE refers to Trichloroethene.
7. trans-1,2-DCE refers to trans-1,2-dichloroethene.
8. cis-1,2-DCE refers to cis-1,2-Dichloroethene.
9. VC refers to Vinyl Chloride.
10. 1,2-DCA refers to 1,2-dichloroethane.
11. Y=Sample exhibits chromatographic pattern which does not resemble standard.
12. Z=Sample exhibits unknown single peak or peaks.
13. C=Presence confirmed, but RPD between columns exceed 40%.
14. L=Lighter hydrocarbons contributed to the quantitation.
15. RWQCB ESL refers to the California Regional Water Quality Control Board F399 Environmental Screening Level for shallow soils less than 10 feet deep assuming groundwater is a current or potential source of drinking water, as presented in Table A of the RWQCB ESLs (2005).
16. DHS MCL refers to California Department of Health Services Maximum Contaminant Level.
17. Bromodichloromethane and Chloroethane were detected at 4.3 and 2.1 $\mu\text{g}/\text{L}$, respectively, in Well MW-13.

CASE NARRATIVE

Laboratory number: 200136
Client: Bureau Veritas North America
Project: 33104-004578.00
Location: Sausage Factory
Request Date: 12/20/07
Samples Received: 12/20/07

This hardcopy data package contains sample and QC results for ten water samples, requested for the above referenced project on 12/20/07. The samples were received on ice and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B and EPA 8021B):

Low surrogate recovery was observed for trifluorotoluene (FID) in MW-13 (lab # 200136-010). High surrogate recoveries were observed for bromofluorobenzene (FID) and trifluorotoluene (FID) in a number of samples. High surrogate recoveries were observed for bromofluorobenzene (PID) and trifluorotoluene (PID) in MW-08 (lab # 200136-005). No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):

No analytical problems were encountered.
