**SUBJECT: 2<sup>ND</sup> SEMI-ANNUAL 2012 GROUNDWATER  
MONITORING AND SAMPLING REPORT**  
15595 Washington Avenue, San Lorenzo, CA

Dear Mr. Detterman:

Enclosed, please find a copy of the January 7, 2013 subject 2<sup>nd</sup> Semi-Annual of 2012 Groundwater Monitoring and Sampling Report prepared by my consultant, Enviro Soil Tech Consultants.

I declare, under penalty of perjury, that the information and/or recommendations contained in this report are true and correct to the best of my knowledge.

Sincerely,

M. Mohammadian  
MEDHAT MOHAMMADIAN

**SUBJECT: SECOND SEMI-ANNUAL OF 2012 GROUNDWATER  
MONITORING & SAMPLING AT THE PROPERTY**

Located at 15595 Washington Avenue, in  
San Lorenzo, California

Dear Mr. Mohammadian:

This report presents results of groundwater monitoring performed at 15595 Washington Avenue in San Lorenzo in November 2012. Samples were collected from all ten monitoring wells. The results continue to give positive indication that gasoline concentrations are declining and that the plume of contaminated groundwater is dissipating steadily due to natural attenuation processes. The Total Petroleum Hydrocarbon concentration was below the detection limit in all wells except MW-5. As predicted in our monitoring report for the first quarter of 2010, the concentration of methyl tertiary butyl ether (MTBE) remains below 10 parts per billion in the most downgradient well (STMW-6), and is also below that level in the most impacted well (MW-5).

January 7, 2013

The work was conducted at the request of Alameda County Health Care Services Agency-Environmental Health Services (ACHCSA-EHS) in February 2007.

If you have any questions or require additional information, please feel free to contact our office at (408) 297-1500 or via email at [info@envirosoiltech.com](mailto:info@envirosoiltech.com).

Sincerely,

**ENVIRO SOIL TECH CONSULTANTS**

## SITE DESCRIPTION

The site is located on the northwest corner of Washington Avenue and Via Enrico Street, in San Lorenzo, California (Figure 1), and is currently being used as a service station. The site contains one single story building. The underground storage tanks are located at the center portion of the property south of the pump islands. The subject property is located in an area of commercial and residential development.

## BACKGROUND

Several parties have owned or operated this service station in the past 30 years. From 1974 to 1983 it was owned and operated by the Calleri family. In 1983, the Calleri's sold it to Texaco, Inc. Texaco owned the site from 1983 to 1986, but the site was not in operation during that time. Texaco removed the existing USTs in 1986, and subsurface contamination was detected in the fuel tank excavation.

After removing the UST's and discovering the contamination, Texaco sold the property to Bertram Kubo in 1986 or 1987. Mr. Kubo installed three new 10,000-gallon fuel tanks at a new location and reopened as a retail service station. He sold the property in 1990 to the current owner, Mr. Mehdi Mohammadian.

Groundwater Technology conducted a soil and groundwater investigation on behalf of Texaco in 1986. Three monitoring wells (MW-1 to MW-3) were installed, and hydrocarbon impact to shallow groundwater was detected in these wells. Investigation was suspended at that time, and no further work took place under Mr. Kubo's ownership after he purchased the site from Texaco.

After purchasing the site in 1990 and re-sampling the three monitoring wells in 1992, Mr. Mohammadian retained Toxichem Management Systems, Inc. in 1998 to conduct further subsurface investigation. Two additional wells (MW-4 and MW-5) were installed to the north of the three existing wells. Quarterly monitoring of all five wells began in August 1998.

ESTC continued the investigation in 2000 by drilling several new borings west and southwest of the site, in the presumed downgradient direction. Further investigation took place in October and November 2006 and April 2007. This work served as the basis for a Site Conceptual Model report and Corrective Action Plan, which were completed in August 2007.

## **SCOPE OF PRESENT WORK**

The scope of work included the following tasks:

- Measure the depth to groundwater in each well
- Purge and sample all wells
- Analyze the samples for Total Petroleum Hydrocarbons in the range of gasoline, Benzene, Toluene, Ethylbenzene, Total Xylenes (BTEX), gasoline oxygenates, and volatile organic compounds
- Review the results and prepare a monitoring report

## **GROUNDWATER MONITORING**

After the wells were opened and allowed to equilibrate with atmospheric pressure, the depth to groundwater was measured and recorded. Then a disposal bailer was lowered into each well to check for hydrocarbon sheen or odor, and approximately four to five well volumes of water were bailed from each well in order to purge standing water

from the casing and assure that water samples would be representative of surrounding groundwater. The purged water was added to the site's plastic storage tank and water, and a fresh sample was collected and decanted in 40-ml glass vials. The samples were labeled and placed in a cold ice chest and then transported to Accutest Laboratories, a state-certified laboratory for analysis, with proper chain-of-custody. The sampling was conducted in accordance with ESTC's Standard Operation Procedures (Appendix "D") and ACHCSA-EHS guidelines.

## **DEPTH TO GROUNDWATER AND FLOW DIRECTION**

The depth to groundwater on November 14, 2012 ranged from slightly more than 7.5 feet in STMW-6 and STMW-8 to slightly less than 10 feet in MW-5 (Table 1). This is slightly deeper than in the first quarter of 2012 but shallower than in the third quarter of 2011. The depth data were converted to elevation relative to sea level and contoured in Figure 2. The overall groundwater flow direction is slightly south of west, but varies from due west at the south end of the site to slightly north of west at the north end of the site.

## **ANALYTICAL RESULTS**

The laboratory report is in Appendix "F" and the analytical results are summarized in Table 1. Isocontour maps of the TPHg, Benzene, and MTBE concentrations are given in Figures 3 through 5.

MW-5 is the only well in which Total Petroleum Hydrocarbons in the gasoline range were detected above the standard detection limit of 50 parts per billion. The concentration of 1080 ppb is the lowest concentration detected in this well since the fourth quarter of 2000, and is only 55% of the concentration that was detected in the first quarter of 2012.

Likewise, the concentrations of volatile aromatic hydrocarbons (BTEX) were below the detection limit in all wells except MW-5. Even in this well, none of these compounds was above 3 parts per billion. As noted in our report for the first quarter, the benzene concentration in MW-5 has been stable between 1 and 3 parts per billion for several quarters now.

Methyl tertiary butyl ether (MTBE) was detected in four wells. The values in MW-1, MW-3, and MW-6 are so low that they represent only estimated values. The value for MW-5 is 2.8 ppb, which is a new historical low for this well. Our monitoring report for the first quarter of 2010 included a graph of the MTBE concentration in STMW-6, and the report predicted that the concentration would drop below 10 µg/L by the first quarter of 2011. It reached that level in early 2012 and remains below that concentration. We did not predict when the concentration would drop below that level in MW-5, but this is the first time it has been this low.

The TBA concentration is also continuing to decline in MW-5, and in November it dropped to 42.7 parts per billion, which is a new historical low value. TBA was not detected in any other well.

## **CONCLUSIONS AND RECOMMENDATIONS**

The groundwater flow direction at this site is relatively stable in a generally westerly direction, but varies slightly from northwest to southwest depending on the specific location. Total Petroleum Hydrocarbons are below the standard detection limit in almost all wells, as are the concentrations of volatile aromatic hydrocarbons (BTEX), and continue to decline. The MTBE concentration exceeds the detection limit of 1 part per billion in only one well, but is still below the taste and odor threshold for MTBE.

The Alameda County Health Care Services Agency-Environmental Health Services requested further assessment southwest of the site in a letter dated November 28, 2011, and ESTC submitted a work plan to comply with that request in February 2012. However, the State Underground Tank Cleanup Fund concurs with our previous conclusion that the site is a low-risk groundwater case and should be closed with no further action. Therefore, the Fund has not approved additional expenditures for further assessment.

A copy of this report should be forwarded to ACHCSA-EHS and the Regional Water Quality Control Board for their review and comments.

## LIMITATIONS

This report and the associated work have been provided in accordance with the general principles and practices currently employed in the environmental consulting profession. The contents of this report reflect the conditions of the site at this particular time. The findings of this report are based on:

- 1) The observations of field personnel.
- 2) The results of laboratory analyses performed by a state-certified laboratory.

It is possible that variations in the soil and groundwater could exist beyond the points explored in this investigation. Also, changes in groundwater conditions of a property can occur with the passage of time due to variations in rainfall, temperature, regional water usage and other natural processes or the works of man on this property or adjacent property.

The services that ESTC provided have been in accordance with generally accepted environmental professional practices for the nature and conditions of work completed in the same or similar localities at the time the work was performed. The contents of this report reflect the conditions of the subject site at this particular time. No other warranties, expressed or implied as to the professional advice provided are made.

† Well screens are not submerged

\* Well screens are submerged

• TPH as gasoline reported value due to high concentrations of MTBE which are present in the TPH as gasoline quantitation range  
**a** Report TPH as gasoline value is the result of high concentrations of discrete peak (MTBE) within the TPH as gasoline quantitation range  
**b** TPH as gasoline value is the result of high concentrations of MTBE and high boiling point hydrocarbon mixture within the TPH as gasoline quantitation range

**c** Report TPH as gasoline value contains the result of high concentrations of MTBE within the TPH as gasoline quantitation range

**d** TPH as gasoline value contains high concentration of MTBE and a typical gasoline pattern within the TPH as gasoline quantitation range

**e** TPH as gasoline reported value due to high concentrations of MTBE present in the TPH as gasoline

**n** Report TPH as gasoline value contains the result of high concentrations of MTBE within the TPH as gasoline quantitation range.  
High surrogate recovery for 4-BFB due to matrix interference. See TFT results.

**f** Value is largely due to MTBE

☆ Groundwater elevation was surveyed based on Horizontal in California Coordinate System 1983, Zone 3. The benchmarks are NGVD 1929 Datum

**g** A typical pattern

**h** Indicates an estimated value

**i** A typical pattern. Value due to non-target compound(s)

## **A P P E N D I X "D"**

### **STANDARD OPERATION PROCEDURE**

**ENVIRO SOIL TECH CONSULTANTS**

## **GROUNDWATER SAMPLING**

All sampling equipment (i.e. bailer, cables, bladder pump, discharge lines and etc.) was cleaned by pumping TSP water solution followed by distilled water prior to collection of groundwater samples.

Prior to purging, the well "Water Sampling Field Survey Forms" were filled out (depth to water and total depth of water column were measured and recorded). The well was then bailed or pumped to remove four to ten well volumes or until the discharged water temperature, conductivity and pH stabilized. "Stabilized" is defined as three consecutive readings within 15% of one another.

The groundwater sample was collected when the water level in the well recovered to 80% of its static level.

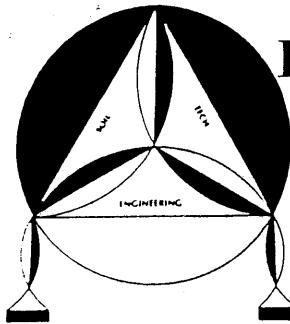

Forty milliliter (ml.), glass volatile organic analysis (VOA) vials with Teflon septa were used as sample containers. The groundwater sample was decanted into each VOA vial in such a manner that there was a meniscus at the top. The cap was quickly placed over the top of the vial and securely tightened. The VOA vial was then inverted and tapped to see if air bubbles were present. If none were present, the sample was labeled and refrigerated for delivery under chain-of-custody to the laboratory. The label information would include a sample identification number, job identification number, date, time, type of analysis requested, and the sampler's name.
