RE: Results of Quarterly Groundwater Sampling at 1401 and 1421 Park Avenue
April 8, 1997

Dear Susan:

Enclosed is one copy of the subject report which was prepared for Electro-Coatings by Geraghty & Miller Inc. The next quarterly sampling event is scheduled for July 1997.

As you know, the remediation project is on schedule, all 85 injection points were installed and the injections were made in April. The quarterly sampling reported in the attached report took place prior to the injections, but you will note the positive effects of the pilot test in MW10 and MW12.

Yours very truly,

Judy Garvens
Administrative Manager

cc: Mr. Sum Arigala, RWQCB

SUBJECT: **Quarterly Groundwater Sampling Results, 1401 and 1421 Park Avenue, Emeryville, California.**

Dear Ms. Garvens:

This letter presents the results of the quarterly groundwater sampling activities performed on behalf of Electro-Coatings, Inc. (ECI) at the site referenced above. The scope of work for the quarterly sampling was presented in the Geraghty & Miller letter dated November 13, 1996.

FIELD ACTIVITIES AND LABORATORY ANALYSIS

Monitoring Wells MW-3A, MW-9, MW-11, MW-12, MW-13, and MW-20 were sampled on April 7, 1997 and Monitoring Wells MW-1, MW-4, MW-6, MW-10, MW-14, MW-16, and MW-17 were samples on April 8, 1997 as part of the quarterly groundwater monitoring program. Prior to purging, depth to water and total well depth measurements were obtained from each well. The wells were then purged of at least three casing volumes of water. The well purging was accomplished using an aboveground diaphragm pump. New polyethylene tubing was used for each well. The purged water was monitored for temperature, pH, and specific conductance. A summary of the field data is presented in Table 1. Depth-to-water and groundwater elevation data are presented in Table 2.

Following purging, groundwater samples were collected using a new polyethylene bailer for each well. The water samples were collected into the appropriate USEPA-approved containers, placed on ice, and transported to Sequoia Analytical Laboratory in Walnut Creek, California, along with chain-of-custody documentation.

RESULTS

Depth to Water and Groundwater Elevations

Depth to water ranged from 2.63 feet below ground surface (Well MW-20) to 6.92 feet below ground surface (Well MW-13). A summary of depth to water and groundwater elevations is presented in Table 2. The groundwater elevations and a groundwater contour map are presented in Figure 1. Based on the depth to water data recorded on April 7 1997, the direction of groundwater flow is toward the west, which is consistent with the previous sampling event (Geraghty & Miller, December 10, 1996).

Laboratory Analytical Results

Chromium Results

The historical and current analytical results for total and hexavalent chromium are summarized in Table 3 and the current results are presented in Figure 2. The overall pattern is consistent with previous sampling events. The highest concentrations of both total and hexavalent chromium were detected in Monitoring Wells MW-13 and MW-17, respectively. Decreasing concentrations were detected with increased distance downgradient of the site in Wells MW-6 and MW-16. Hexavalent chromium was not detected in the water samples collected from the deep wells (MW-3A and MW-20) sampled during this quarterly event, while total chromium was detected at 14 and 55 micrograms per liter ($\mu\text{g}/\text{L}$), respectively.

The chromium and hexavalent chromium results for Monitoring Well MW-10 are likely to reflect the continued influence of the pilot test that was performed during 1995 and 1996. Prior to the April 8, 1997 sampling, Well MW-10 was last sampled as part of the quarterly monitoring program in April 1995. At that time the concentrations of chromium and hexavalent chromium were 170,000 $\mu\text{g}/\text{L}$ and 160,000 $\mu\text{g}/\text{L}$, respectively. In the April 1997 sampling the concentrations of chromium and hexavalent chromium were 6,500 $\mu\text{g}/\text{L}$ and ND (<5.0 $\mu\text{g}/\text{L}$), respectively. This decrease of approximately three orders of magnitude is likely the result of the pilot test that was performed at the site during August 1995 through May 1996. As part of the pilot test, inoculated molasses solution was injected into the groundwater through an injection point that was installed approximately 10 feet upgradient of MW-10. Water samples were collected for analysis from Well MW-10 during the pilot test and revealed an order of magnitude decrease in chromium concentrations and a decrease to below detection levels for hexavalent chromium. The figure presented in Attachment 2 summarizes the groundwater analytical results for chromium, hexavalent chromium and trichloroethylene (TCE) collected during the pilot study. For a detailed discussion of the

procedures and results of the pilot test, see the Geraghty & Miller report dated October 9, 1996.

Purgeable Halocarbon Results

The historical and current analytical results for purgeable halocarbons are summarized in Table 4. Figure 3 presents the concentrations of TCE and tetrachloroethylene (PCE) detected during the April 1997 sampling event. TCE and cis-1,2-DCE were the most frequently detected halocarbons. TCE was the most frequently detected compound, and it was detected at the highest concentrations. The highest concentrations of TCE were detected in Monitoring Well MW-14, to the west of the site.

The results for MW-10 may be influenced by the pilot test that was performed during 1995 and 1996. As discussed above, MW-10 was sampled in April 1997 for the first time as part of the quarterly sampling program since April 1995. The concentration of TCE detected during the April 1995 sampling event was 10,000 µg/L, whereas the concentration detected during the April 1997 event was 660 µg/L. The decrease of approximately two orders of magnitude in the concentration is likely the result of the pilot test. During the pilot test, the concentration of TCE dropped to as low as 450 µg/L in October 1995 (Attachment 2).

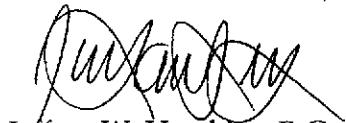

GROUNDWATER REMEDIATION PROGRAM

A groundwater remediation program was initiated at the site during April 1997. A work plan was submitted to the Regional Water Quality Control Board and the Alameda County Department of Environmental Health prior to implementing the program. A description of the remediation program is in the Geraghty & Miller workplan dated March 17, 1997.

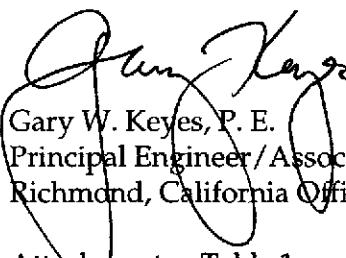

Geraghty & Miller appreciates the opportunity to be of service. If you have any questions regarding this report, please do not hesitate to call.

Sincerely,
GERAGHTY & MILLER, INC.

Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

** MS = Matrix Spike, MSD = MS Duplicate, RPD = Relative % Difference

Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

** MS = Matrix Spike, MSD = MS Duplicate, RPD = Relative % Difference
