Re: **Groundwater Monitoring and Remediation Report – Fourth Quarter 2008**
Former Shell Service Station
1230 14th Street
Oakland, California
Fuel Leak Case No. RO0000433

Dear Mr. Wickham:

On behalf of property owner Andy Saberi, Pangea Environmental Services, Inc has prepared this *Groundwater Monitoring and Remediation Report – Fourth Quarter 2008*. The report describes groundwater monitoring, sampling, remediation progress and other site activities.

If you have any questions or comments, please call me at (510) 435-8664 or email briddell@pangeaenv.com.

Sincerely,
Pangea Environmental Services, Inc.

A handwritten signature in blue ink that reads "Bob Clark-Riddell".

Bob Clark-Riddell, P.E.
Principal Engineer

Groundwater Monitoring and Remediation Report – Fourth Quarter 2008
1230 14th Street
Oakland, California
January 30, 2009

INTRODUCTION

On behalf of Andy Saberi, Pangea Environmental Services, Inc. (Pangea) performed groundwater monitoring and sampling during the current quarter at the subject site. The purpose of the monitoring and sampling is to evaluate dissolved contaminant concentrations and groundwater flow direction. The purpose of the remediation is to remove residual petroleum hydrocarbon from site soil and groundwater. The site location is shown on Figure 1. Current groundwater analytical results and elevation data are shown on Figure 2. Current and historical data are summarized on Table 1. Well construction details are summarized on Table 2.

SITE BACKGROUND

The former Shell-branded service station is located at the northeast corner of 14th Street and Union Street in Oakland, California (Figure 1). Currently, an abandoned one-story station building and a pump-island canopy occupy the site, and much of the property is unpaved. Land use in the surrounding area is currently residential to the north, south, and east, and is commercial/industrial to the west and southwest. The site topography is essentially flat.

Site History

According to prior reports, the current site building was constructed in 1958 and gas station operations at the site reportedly began in 1958 and ceased in 1993. Petroleum hydrocarbons were first discovered in site soil near the underground storage tanks (USTs) during the completion of three borings at the site in February 1991. Four gasoline USTs and one waste oil storage tank were removed from the site on August 24, 1993. The current property owner, Mr. Andy Saberi, purchased the property in the mid 1980s.

Previous Environmental Work

Previous environmental work has included site assessment, a sensitive receptor evaluation/well survey, risk evaluation, two rounds of feasibility testing (in 2000 and 2006), and several remedial actions, including injection of oxygen releasing compound (ORC) into site wells in 1997, groundwater extraction (GWE) and dual-phase extraction (DPE) from 2002 to 2004, and hydrogen peroxide injection into site wells in 2003. Quarterly groundwater monitoring activities have been performed at the site since 1996.

In January 2008, Pangea submitted a *Draft Corrective Action Plan and Pilot Test Work Plan* (Draft CAP/Test Workplan) as required by Alameda County Environmental Health (ACEH). Following completion of the public-participation comment period, Pangea began implementation of the approved Draft CAP/Test Workplan in June 2008 by installing new remediation test wells, repairing damaged remediation wells, and destroying one remediation well. The *Well Installation and Destruction Report* dated October 6, 2008 details

Groundwater Monitoring and Remediation Report – Fourth Quarter 2008
1230 14th Street
Oakland, California
January 30, 2009

this remediation well work. In early July 2008, Pangea conducted the approved pilot testing using the newly installed remediation test wells to determine whether SVE or DPE would most effectively remove contaminants and capture hydrocarbon vapors resulting from air sparging. In the *SVE/DPE Pilot Test Report* dated October 7, 2008, Pangea recommended DPE/AS as the most effective remedial approach for the site. In a letter dated October 29, 2008, Alameda County Environmental Health (ACEH) approved implementation of DPE/AS remediation at the site.

GROUNDWATER MONITORING AND SAMPLING

On November 20, 2008, site monitoring wells were gauged for depth-to-water and inspected for separate-phase hydrocarbons (SPH) prior to collection of groundwater samples. Site wells were sampled according to the monitoring program shown in Appendix A. Well caps were removed from all monitoring wells and technicians allowed at least 15 minutes for water level equilibration before measuring depth to water.

Before well purging, the dissolved oxygen (DO) concentration was measured in each well. DO was measured by lowering a downwell sensor to the approximate middle of the water column (except well AS-1, where DO was measured above ground due to the 1-inch diameter casing preventing the DO probe from fitting down the well), and allowing the reading to stabilize during gentle height adjustment. Prior to sample collection, approximately three casing volumes of water were purged using disposable bailers, an electric submersible pump, check valve with tubing, or a peristaltic pump. During well purging, field technicians measured pH, temperature and conductivity. A groundwater sample was collected from each well with a disposable bailer, and decanted into the appropriate containers supplied by the analytical laboratory. Groundwater samples were labeled, placed in protective plastic bags, and stored on crushed ice at or below 4°C. All samples were transported under chain-of-custody to the State-certified analytical laboratory. Purge water was stored onsite in DOT-approved 55-gallon drums. Groundwater monitoring field data sheets, including purge volumes and field parameter measurements, are presented as Appendix A.

MONITORING RESULTS

Current and historical groundwater elevation data and analytical results are described below and summarized on Table 1. Groundwater samples were analyzed for total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by EPA Method 8015Cm/8021B. Samples were analyzed by McCampbell Analytical, Inc., of Pittsburg, California, a State-certified laboratory. The laboratory analytical report is included in Appendix B.

Groundwater Monitoring and Remediation Report – Fourth Quarter 2008
1230 14th Street
Oakland, California
January 30, 2009

Groundwater Flow Direction

Based on depth-to-water data collected on November 20, 2008, the groundwater flow direction at the site is approximately northeastwards, as shown on Figure 2. The inferred groundwater flow direction is generally consistent with previous monitoring results. Depth-to-water and groundwater elevation data are presented in Table 1.

Hydrocarbon Distribution in Groundwater

No SPH were observed in any of the site wells. Hydrocarbons were not detected in wells MW-2 through MW-4. The maximum TPHg and benzene concentrations detected this quarter were in source area well MW-5R (23,000 µg/L and 5,200 µg/L, respectively), the replacement well for damaged well MW-5. Hydrocarbon concentrations in site wells are generally within historic ranges. Groundwater analytical data are included in Table 1 and on Figure 2.

Former remediation well VW/AS-1, which contained the highest TPHg concentration detected onsite to date (180,000 µg/L on December 6, 2007), was replaced with air sparge well AS-1 in the overdrilled borehole in June 2008. TPHg concentrations in well AS-1 this quarter were significantly lower (640 µg/L) than those previously detected in VW/AS-1. This difference in concentrations is likely due to the fact that well VW/AS-1 was screened from 6 to 15 ft and 17.5 to 19.5 ft bgs, while well AS-1 is screened from 22 to 25 ft bgs. Other newly installed remediation wells were not sampled this quarter.

Fuel Oxygenate Distribution in Groundwater

MTBE was not detected in any site wells this quarter. Historically, MTBE has been detected only sporadically in site wells. Since 2003, detected MTBE concentrations have been below the Maximum Contaminant Level (MCL) for drinking water of 13 µg/L, except for a concentration of 20 µg/L detected in well MW-5 in February 2008. This MTBE result could be a false positive result, but was not confirmed using EPA Method 8260. MTBE is not a primary constituent of concern at this site due to limited and sporadic (and potentially false) MTBE detections. MTBE concentrations are shown in Table 1 and on Figure 2.

REMEDIATION SUMMARY

Remediation Well Installation

Pangea submitted a *Draft Corrective Action Plan and Pilot Test Work Plan* (Draft CAP) on January 18, 2008, which was approved by ACEH following a public comment period in a letter dated June 5, 2008. On June 26 and 27, 2008, Pangea installed five new remediation wells, replaced one remediation well and one monitoring well, and destroyed one remediation well. Pangea also installed a soil vapor monitoring well between the

Groundwater Monitoring and Remediation Report – Fourth Quarter 2008
1230 14th Street
Oakland, California
January 30, 2009

existing site building and the northern property boundary. The *Well Installation and Destruction Report* dated October 6, 2008 details well installation and destruction activities. The locations of the remediation wells are shown on Figure 2.

Pilot Testing

On July 8 though July 11, 2008, Pangea conducted onsite pilot testing using a 300-cfm liquid ring blower assembly with a oxidizer and conducted the pilot test as proposed in the Draft CAP/Test Workplan. The objective of pilot testing was to determine whether SVE or DPE would be the more appropriate technique for removing hydrocarbons and capturing hydrocarbon vapors created by air sparging. Vacuum influence and water level measurements were collected during testing to confirm the appropriateness of the remediation well network. The *SVE/DPE Pilot Test Report* dated October 7, 2008 describes pilot testing procedures and results and recommended installation of a DPE/AS system.

DPE/AS System Installation

In a letter dated October 29, 2008, ACEH approved implementation of DPE/AS remediation at the site and requested system design drawings. The system design drawings were provided to ACEH on January 21, 2009. Pangea has commenced system permitting and installation coordination.

OTHER SITE ACTIVITIES

Upcoming Monitoring

Pangea will continue groundwater monitoring and sampling at the site on a quarterly basis in accordance with the monitoring program in Appendix A. All site monitoring wells will be gauged for depth to water and inspected for SPH. Groundwater samples will be collected from wells not containing SPH and will be analyzed for TPHg, BTEX and MTBE by EPA Method 8015Cm/8021B. To control cost, Pangea has discontinued sample analysis by EPA Method 8260B due to relatively low MTBE concentrations detected in recent years. Pangea will summarize groundwater monitoring activities and results in a groundwater monitoring report following completion of each future groundwater monitoring event.

Pangea

Table 1. Groundwater Elevation and Analytical Data - Saberi, 1230 14th Street, Oakland, CA

Well ID	Date Measured	DTW (feet) (MSL)	GWE (feet)	TPHg (ug/L)	Benzene (ug/L)	Toluene (ug/L)	Ethylbenzene (ug/L)	Xylenes (ug/L)	MTBE (ug/L)	Dissolved Oxygen (mg/L)
Notes:										
a = Sample was analyzed outside of the EPA recommended holding time.										
b = Hydrocarbon reported does not match the pattern of the laboratory's standard.										
c = Top of casing change due to maintenance.										
d = Sample contains discrete peak in addition to gasoline.										
e = Quantity of unknown hydrocarbon(s) in sample based on gasoline.										
f = The concentration reported reflects individual or discrete unidentified peaks not matching a typical fuel pattern.										
g = The concentration indicated for this analyte is an estimated value above the calibration range of the instrument.										
h = Secondary ion abundances were outside method requirements. Identification based on a'-lytical judgement.										
i = Analyte was detected in the associated Method Blank.										
j = pH>2										
k = Analyzed by EPA Method 8015B (M).										
l = The sample chromatographic pattern for TPH does not match the chromatographic pattern of the specified standard. Quantitation of the unknown hydrocarbon(s) in the sample was based upon the specified standard.										
m = Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.										
Site surveyed November 1, 2001 by Virgil Chavez Land Surveying of Vallejo, CA.										
TPHg = Total petroleum hydrocarbons as gasoline by modified EPA Method 8015C.										
Benzene, Toluene, Ethylbenzene, and Xylenes by EPA Method 8260B from April 27, 2001 through August 16, 2007. Concentrations prior to April 27, 2001 and after August 16, 2007 by EPA Method 8021B.										
MTBE = Methyl tert-butyl ether by EPA Method 8021B, concentrations in parentheses by EPA Method 8260B										
-- = Not applicable										
ug/L = micrograms per liter (Parts per billion)										
mg/L = milligrams per liter (Parts per million)										
MSL = Mean sea level										
ft. = Feet										
<n = Below detection limit										
(D) = Duplicate sample										
n/n = Pre-purge/Post-purge DO Readings

Notes and Abbreviations:

1= Sample Analytes: Total Petroleum Hydrocarbons as Gasoline (TPHg), benzene, toluene, ethylbenzene, xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by EPA Method 8015Cm/8021B.

Q = All four quarters. Typically B months (February, May, August, November)

Mon = Groundwater Monitoring Well

Rem= Remediation Well

VW = Vapor Extraction Well

VMP= Vapor Monitoring Well

DP = Dual Phase Extraction

N, S, W, E = Cardinal directions North, South, West, East and other directions (e.g., Northeast = NE)

-- = Not applicable, gauged or sampled.

	Client P.O.:	Date Completed: 11/26/08

WorkOrder: 0811663

November 26, 2008

Dear Celia:

Enclosed within are:

- 1) The results of the **10** analyzed samples from your project: **#1150.001; Saberi-1230 14th St.,**
- 2) A QC report for the above samples,
- 3) A copy of the chain of custody, and
- 4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing
McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

^f TPH(btex) = sum of BTEX areas from the FID.

cluttered chromatogram; sample peak coelutes with surrogate peak.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = matrix interference and/or analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content, or inconsistency in sample containers.
