RE: Former Exxon RAS #7-3006/720 High Street, Oakland, California.

Dear Mr. Gholami:

Attached for your review and comment is a copy of the letter report entitled *Site Conceptual Model*, dated May 24, 2005, for the above-referenced site. The report was prepared by Environmental Resolutions, Inc. (ERI) of Petaluma, California, and details evaluation activities for the subject site.

Upon information and belief, I declare, under penalty of perjury, that the information contained in the attached report is true and correct.

If you have any questions or comments, please contact me at 510.547.8196.

Sincerely,

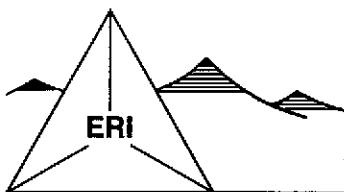

Jennifer C. Sedlachek
Project Manager

Attachment: ERI's Site Conceptual Model, dated May 24, 2005.

Subject: Site Conceptual Model, Former Exxon Service Station 7-3006, 720 High Street, Oakland, California

At the request of Exxon Mobil Corporation (Exxon Mobil), Environmental Resolutions, Inc. (ERI) has prepared this Site Conceptual Model (SCM) report for the subject site, located at 720 High Street in Oakland, California (Plate 1). Specifically, this report provides (1) a summary of site history, (2) detailed description of a recent investigation conducted at the site, (3) a summary of site geology and hydrogeology, (4) an assessment of soil and groundwater data, (5) results of an update to the existing sensitive receptor survey (SRS), and (6) an exposure assessment accounting for current land use at and in the vicinity of the site. This SCM report has been prepared in response to a request from Alameda County Health Agency (the County), Department of Environmental Health (the County) in a letter to Exxon Mobil dated February 17, 2005, and subsequent conversations, and electronic correspondence with the County (Attachment A).

INTRODUCTION

Exxon Mobil operated a service station at the site from 1970 until 1987. The site is currently an active Gas and Food branded station owned and operated by Mr. Mashoon of Mash Petroleum, Inc. The current service station contains three underground storage tanks (USTs), storing three grades of unleaded gasoline. The locations of the former and current USTs, dispenser islands, groundwater monitoring wells, and select site features of the subject site are shown on Plates 2A and 2B. Quarterly groundwater monitoring was conducted at the site from April 1989 until December 1999, and since March 2000, the groundwater monitoring was conducted on an annual basis.

SITE BACKGROUND

The site is located on the southeast corner of the intersection of High Street and Coliseum Way in Oakland, California (Plate 2A). The site is located on relatively flat terrain at an elevation of approximately 14 feet, as depicted on the Oakland East, California quadrangle U.S. Geological Survey 7.5 Minute Series map. Topography in the site vicinity slopes gently to the southwest. Interstate 880 (I-880) is an elevated freeway located west of the site. The Oakland Estuary Tidal Canal is located approximately 1,900 feet southwest of the site. The canal is connected to the San Leandro Bay, which is part of the San Francisco Bay and is located approximately 3,100 feet south of the site.

Land use in the vicinity of the site is predominately industrial (Plate 3). To the north across High Street is Larm's Building Materials, adjacent to the site to the northeast is a lumber yard (formerly a dry cleaning plant [Bell Cleaning and Dyeing Co.] dating to the 1920s and automobile wrecking yard [Ed's Auto Parts] dating from 1953 to 1969), and to the southeast by Alameda Avenue is a vacant lot. To the south across Alameda Avenue is the Southern Pacific Railroad line. To the west is the elevated I-880 freeway.

Site History

A detailed site history is presented in *Limited Record Search* dated March 24, 1993 (RESNA 1993a). A brief summary of site use is presented in the following list:

- | | |
|--------------|---|
| 1912 to 1934 | Standard Oil Company of California (currently known as Chevron U.S.A.) operated an oil storage and distribution facility on the southwestern part of the site. Up to six aboveground storage tanks were on site during this period. |
| 1934 to 1970 | The southwestern part of the site was occupied by two residences. |
| 1953 to 1969 | Mr. and Mrs. Roy Hatton purchased the northeastern part of the site and used the property as an automobile junkyard. |
| Prior 1970 | The site was also used as a dump site (AGS 1987a). |
| 1970 | Humble Oil and Refining Company purchased the property and built an Exxon Service Station 7-3006 at the site. |
| 1987 | Exxon Mobil discontinued operation at the site. The property was sold to Victor and Lye Kyin Chu. |
| 1987 to 1991 | Site was vacant. |
| 1991 | New USTs were installed in the northwestern corner of the site. The site was operated as a Coast retail gasoline station. |
| 2004 | The property was sold to Mash Petroleum, Inc. and currently is operated as a Gas and Food branded station. |

Site Investigations

A summary of site activities is presented in the following subsections:

- | | |
|------------|---|
| April 1987 | Four USTs (10,000-, 8,000-, and 6,000-gallon gasoline tanks, and 1,000-gallon used-oil tank) were excavated and removed from the site by Pacific Southwest Construction and Service (AGS 1987b). Total volatile hydrocarbons were detected at concentrations greater than 1,000 milligrams per kilogram (mg/kg) in soil samples collected from the gasoline UST pit. Total petroleum hydrocarbons as diesel (TPHd) were not detected in the soil sample collected from excavated soil above the used-oil tank pit. Removal of the product and vapor piping revealed a black impacted layer of soil approximately 2 to 3 feet deep that appeared to contain relatively high hydrocarbon concentrations. Concentrations of TPHd were detected at 434 mg/kg in a soil sample analyzed from this layer; the sample was only analyzed for TPHd because the sample appeared oily (AGS 1987b). |
| May 1987 | The gasoline UST excavation was over excavated to a depth of 14 feet below ground surface (bgs), the depth at which groundwater was encountered. A black oily viscous fluid seeping from the southwestern wall of the gasoline UST excavation, at a depth of approximately 12 feet bgs was observed (AGS 1987c). Liquid-phase hydrocarbons (LPH) were observed floating on top of the groundwater at the bottom of the gasoline excavation. Approximately, 1,350 gallons of groundwater (containing 99% water and 1% gasoline) were removed from the excavation and transported off site for disposal (AGS 1987c). Between May and July 1987, approximately 760 cubic yards of soil were excavated, aerated, and subsequently taken off site for disposal. |

June 1987	A soil vapor survey was conducted by EA Engineering, Science, and Technology, Inc. The highest hydrocarbon-vapor concentrations were detected between the former gasoline UST excavation, the southern dispenser islands, and southwest towards Coliseum Way (EA 1987).
September 1987	Seven soil borings (B2 through B8) were drilled and completed as groundwater monitoring wells (MW2 through MW8, respectively) at the site (AGS 1988). Total petroleum hydrocarbons as gasoline (TPHg), TPHd, and benzene were detected at concentrations up to 2,689 mg/kg, 4,261 mg/kg, and 126 mg/kg, respectively in soil.
May 1988	Two soil borings (B1 and B9) were drilled and completed as off-site groundwater monitoring wells (MW1 and MW9, respectively) (AGS 1988). Benzene, toluene, ethylbenzene, and xylenes (BTEX) and TPHg were not detected at or above the laboratory reporting limits in the soil samples collected from MW1 and MW9.
April 1989	Quarterly groundwater monitoring was initiated (AGS 1989a).
July 1989	Well MW5 was destroyed so additional soil could be excavated from the southern part of the former gasoline UST pit (AGS 1989a). Before excavation began, approximately 13,000 gallons of water that had accumulated in the tank pit was pumped into aboveground tanks and later disposed (AGS 1989b). Approximately, 300 cubic yards of soil and debris (including bricks and lumber) were excavated from the southern and southwestern sides of the pit as far towards Coliseum Way as possible. In addition, a concrete structure that appeared to be an old dispenser island was uncovered just southeast of well MW5. Piping containing an oily substance (appeared to be former product lines) extended from the dispenser island towards Coliseum Way. A total of seven gallons of LPH was removed from wells MW2, MW3, MW4, and MW8.
August 1989	Twenty gallons of LPH were removed from wells MW2, MW3, MW4, and MW8.
November 1989	Eleven soil borings (B10 through B20) were drilled and four of the borings were completed as groundwater monitoring wells (B10/MW10 through B13/MW13, respectively) (AGS 1990). Concentrations of TPHg, TPHd, and benzene were detected up to 3,400 mg/kg (B14, 10 feet), 1,900 mg/kg (B14, 10 feet), and 9.0 mg/kg (B16, 7.5 feet), respectively in soil.
November 1990	Twelve soil borings (B21 through B32) were drilled and two of the borings (B31 and B32) were completed as groundwater monitoring wells (MW14 and MW15, respectively) (AGS 1991a).
January 1991	Approximately 500 cubic yards of soil were excavated from the northwestern corner of the site for the new UST field (AGS 1991b). Concentrations of TPHg were detected up to 53 mg/kg in soil samples collected from the walls and floor of the excavation. Benzene was detected in one floor soil sample at a concentration of 0.007 mg/kg and TPHd was not detected in any of the excavation soil samples. Groundwater did not accumulate in the pit. The excavated soil was aerated on site and transported to a Class III facility.
October 1991	Groundwater extraction and treatment was proposed in the <i>Interim Groundwater Remediation Work Plan</i> (AGS 1991c).

- February 1993 Four soil borings (B35, B35A, B36, and B37) were drilled and three of the soil borings (B35A, B36, and B37) were completed as vapor extraction wells (VW1 through VW3) (RESNA 1993b). Concentrations of TPHg, TPHd, and benzene were detected up to 950 mg/kg (B35, 9 feet), 30 mg/kg (B35, 7.5 feet), and 7.6 mg/kg (B35, 9 feet), respectively in soil. In addition, petrotraps (product skimmers) were installed in wells MW2, MW4, and MW6; a vapor extraction test was performed using the three vapor extraction wells; and a 24-hour aquifer test using well MW13 was conducted.
- March 1993 An extensive records search on the area surrounding the subject site (RESNA 1993a).
- March to April 1994 An interceptor trench with seven extraction wells (RW1 through RW7) and six air sparge wells (AS1 through AS6) was installed.
- December 1994 Installation of the remediation system was completed.
- January 1995 to December 1998 The groundwater extraction and treatment (GET) system which removed approximately 10 pounds of TPHg and 3 pounds of benzene was operated (ERI 1999a, ERI 1999b).
- August 1996 to July 1999 The air sparge/soil vapor extraction (AS/SVE) system, which removed approximately 5,144 pounds of TPHg and 61 pounds of benzene, was operated (ERI 1999b).
- November 1999 Natural attenuation monitoring and a risk-based corrective action analysis (RBCA) were performed (ERI 1999c). Based on the evidence presented in the report, natural attenuation has occurred and continues to occur at the site. In addition, the results of the RBCA Tier II analysis indicate that the 90% confidence level of soil samples and the 95% confidence level of groundwater samples do not exceed site specific target levels (SSTLs) for any of the evaluated exposure pathways for BTEX. Low-risk case closure was proposed based on the occurrence of natural attenuation and the results of the RBCA analysis.
- January 2000 At the request of the County, a Case Closure Summary form was submitted to the County (ERI 2000). The County subsequently issued a letter dated January 26, 2000, indicating that they do not concur with site closure and suggested that some type of enhanced bio-remediation might help move site conditions towards acceptable levels for closure.
- March 2000 The County approved the request to perform monitoring and sampling on an annual basis in a letter dated March 28, 2000.
- July 2000 The County, in a letter dated July 28, 2000, requested annual sampling of wells MW1, MW2, MW4, MW6, MW12, and MW14 during the first quarter. In addition, the County concurred with the restart of the air sparging wells located in the extraction trench to enhance bio-remediation.
- December three 2000 Seven groundwater monitoring wells (MW7 through MW11, MW13 and MW15), groundwater recovery wells (RW5 through RW7), and two vadose wells (VW2 and VW3) were destroyed (ERI 2001).
- July 2001 to June 2003 The biosparge system was operated.
- April 2005 Five soil borings and six cone penetrometer tests (CPTs) were advanced. The results of this investigation are described in the Recent Site Investigation section of this report.

Well locations are shown on Plates 2A and 2B. Groundwater monitoring data (1994 - present) are summarized in Tables 1A and 1B. Soil sample analytical results are summarized in Tables 2A and 2B. Well construction details are summarized in Table 3. Grab groundwater analytical results are summarized in Table 4. Remediation system operation and performance data and analytical results are provided in Tables 5 and 6. Historical groundwater monitoring data (1989 - 1994), historical UST sample location maps, and the 1989 chronology are presented in Attachment B. Soil boring logs and well construction diagrams are provided in Attachment C.

Remedial Measures

Exxon Mobil's remedial efforts at the site have included excavation, product bailing, groundwater extraction, vapor extraction, air sparging, and biosparging.

In 1989, approximately 27 gallons of LPH were removed from on-site wells. In 1993, petrotraps were installed in wells MW2, MW4, and MW6, and 6.3 gallons of LPH were removed (RESNA 1993b). The GET system operated from January 1995 to December 1998, the AS/SVE system operated from August 1996 to July 1999, and a biosparge system operated from July 2001 to June 2003.

The GET system was designed to treat separate-phase and dissolved petroleum hydrocarbons in groundwater extracted from the interceptor trench beneath the site. The GET system operated from 1995 to 1998, and was shut down when influent concentrations decreased. Pneumatic pumps were installed in extraction wells RW2 and RW5 to recover groundwater from the interceptor trench. Subsurface and aboveground collection piping are used to transfer extracted groundwater to a holding tank. A transfer pump and poly-vinyl chloride piping are used to direct the water stream from the holding tank through water filters, an airstripper, and subsequently through liquid-phase granular activated carbon canisters connected in series. The treated groundwater was discharged to the sanitary sewer regulated by East Bay Municipal Utilities District (EBMUD). The GET system removed approximately 10 pounds of TPHg and 3 pounds of benzene (ERI 1999a, ERI 1999b).

The AS/SVE system consisted of six air-sparging wells (AS1 through AS6) for air injection and three vadose wells (VW1 through VW3) for vapor extraction within an on-site interceptor trench, a water knock-out tank, a Thermtech VAC-25 thermal/oxidizer, a Gast air compressor, and a propane tank for supplemental fuel. The AS/SVE system operated from 1996 to 1999 and removed approximately 5,144 pounds of TPHg and 61 pounds of benzene (ERI 1999b). The AS/SVE system was shut down when influent TPHg concentrations decreased to near the laboratory reporting limits and TPHg removal rates reached asymptotic conditions.

The bio-sparge system that operated from 2001 to 2003, used an air compressor to inject air into the on-site groundwater interceptor trench to enhance biodegradation. The bio-sparge system was discontinued when it was deemed ineffective.

Regional Geology and Hydrogeology

The site is located along the eastern margin of the San Francisco Bay within the East Bay Plain. The East Bay Plain lies within the Coast Range geomorphic province and is characterized by broad alluvial fans sloping westward into San Francisco Bay. The site and vicinity is underlain by quaternary bay deposits consisting primarily of clays and silty clays interbedded with discontinuous lenses of silty and gravelly sand.

The East Bay Plain is divided into two structurally separate basins, the San Pablo and the San Francisco Basin. These basins are tectonic depressions that are filled primarily with a sequence of coalescing alluvial fans. The San Francisco Basin is divided in seven Sub Areas. The site is located in the Oakland Sub- Area, which is composed of thick sequence of alluvial fill (300 to 700 feet) with no well-defined aquitards (Figures 1998).

The site is located approximately 1,900 northeast of the Oakland Estuary Tidal Canal. The canal is connected to the San Leandro Bay which is part of the San Francisco Bay and is located approximately 3,100 south of the site. Groundwater flow direction is inferred to be to the west southwest toward the tidal canal consistent with site data.

Local Geology

The local geology and hydrogeology of the site was evaluated using boring logs from the most recent investigation and earlier investigations, and monitoring data, to determine preferential pathways. In general, the lithology of site consists primarily of silt with lenses of fine sand and gravel. The lithology logged during the CPT investigation is primarily silt and does not correlate well with the results of previous investigations. Debris and fill material was observed in the southern portion of the site during the CPT investigation. Soil borings from the current and previous investigations are included in Attachment C. Cross-sections have been prepared using boring logs, CPT logs, and monitoring well construction details to illustrate subsurface conditions (Plates 4 through 6).

Local Hydrogeology

The depth to groundwater beneath the site has varied over time and has ranged from approximately 3.5 feet bgs to 11.5 feet bgs. Currently groundwater is encountered at depths of ranging from approximately 3.5 feet bgs to 6.0 feet bgs. Based on the cumulative results of groundwater monitoring and sampling, the groundwater flow direction is predominantly towards the southwest with an average hydraulic gradient of 0.015. Groundwater elevation data since 1994 are presented in Table 1A. Historical groundwater monitoring data is presented in Attachment B. The Groundwater Elevation Map for the May 2, 2005 groundwater monitoring event and a rose diagram showing historical hydraulic gradient and groundwater flow direction are presented on Plate 7.

Hydrographs presenting TPHd, TPHg, MTBE, benzene, and groundwater elevation for wells MW1 through MW4, and MW6 through MW15 are included in Attachment D. A review of these hydrographs reveals that groundwater elevations vary seasonally. The hydrographs indicate that petroleum hydrocarbon concentrations are generally stable or decreasing in the monitoring wells.

RECENT SITE INVESTIGATION

Five on-site direct push soil borings (DP1, and DP3 through DP6) were advanced to evaluate post-remedial soil conditions beneath the site. Four on-site (CPT1 and CPT4 through CPT6) and two off-site CPT borings (CPT2 and CPT3) were advanced to evaluate the lateral and vertical extent of dissolved hydrocarbon beneath and downgradient of the subject site and to evaluate the soil stratigraphy. The boring locations and sample intervals were selected to further investigate areas with elevated concentrations of petroleum hydrocarbons in soil. The locations of the soil and CPT borings are shown on Plates 2B and 4.

Drilling of Soil Borings

On April 6 and 7, 2005, an ERI geologist observed Gregg Drilling and Testing, Inc. (Gregg) of Martinez, California (C57 License #485165) advance five direct-push soil borings (DP1, and DP3 through DP6) using direct-push dual-wall drilling equipment. The boreholes were cleared to 8 feet using a hand auger to ensure that there were no obstructions near the potential path of the push rods. Borings DP1 and DP3 through DP6 were advanced to approximately 12 feet bgs. Pea gravel was encountered just below the

concrete at boring location DP2; therefore, due to the potential of encountering conduit or product lines this boring was not advanced. The borings were continuously logged and select soil samples based on visual inspection and PID readings were collected from each boring for laboratory analysis. A detailed description of drilling methods and procedures is provided in Attachment E. The locations of the borings are shown on Plates 2B and 4.

Cone Penetrometer Test Borings

On April 6 and 7, 2005, an ERI geologist observed Gregg use a direct-push CPT drill rig to advance four on-site CPT borings (CPT1 and CPT4 through CPT6) and two off-site CPT borings (CPT2 and CPT3) to 45 feet bgs. Prior to advancing the CPT, the boreholes were cleared to 8 feet using a hand auger to ensure that there were no obstructions near the potential path of the push rods. At each borehole, select soil samples (based on visual inspection and PID readings) were also collected for analysis as described below. The locations of the borings are shown on Plates 2B and 4. A description of the materials encountered, the corresponding CPT plot, and pore pressure dissipation test curves are included in Attachment F.

The CPT borings were backfilled using a tremie pipe and cement slurry from total depth of the boring to the ground surface.

Soil Sample Collection

Soil samples were collected using a hand auger lined with brass sleeves for soil in the upper 8 feet and a direct-push sampling device was used to collect soil samples from the base of the hand-augered hole to the total depth of the boring. The soil samples were collected in brass sleeves, sealed with Teflon tape, capped, labeled, and placed in a cooler filled with ice. The soil cuttings and contents from the remaining sleeves were examined for soil characteristics and screened in the field with a photo-ionization detector (PID) to determine relative hydrocarbon content. The soils are described and the PID readings are shown on the boring logs in Attachment C. Some soil samples were collected below first encountered groundwater (2 to 12 feet bgs) and are considered submerged samples.

Upon completion of sampling, the boreholes were backfilled from the total depth of the borings to the ground surface using cement slurry. The ground surface was repaired to match the surroundings. The downhole sampling equipment and push rods were steamcleaned before drilling began and upon completion of each hole.

Soil Sample Analytical Results

Soil samples were analyzed by TestAmerica Incorporated (TestAmerica), a California state-certified laboratory, for TPHg and TPPh using EPA Method 8015B; BTEX using EPA Method 8021B; and fuel oxygenates, (MTBE, ethyl tertiary butyl ether [ETBE], tertiary amyl methyl ether [TAME], tertiary butyl alcohol [TBA], di-isopropyl ether [DIPE]), and lead scavengers (1,2-dichloroethane [1,2-DCA] and 1,2-dibromomethane [EDB]) using EPA Method 8260B.

Concentrations of TPHg were detected up to 1,190 mg/kg (DP1, 10.5 feet). Concentrations of TPPh were detected up to 12,000 mg/kg (DP5, 5 feet). Concentrations of benzene were detected up to 4.78 mg/kg (DP1, 10.5 feet). Concentrations of MTBE were detected up to 0.0230 mg/kg (CPT4, 8 feet). Analytical results are summarized in Tables 2A and 2B and presented on Plate 8. The laboratory analytical reports and Chain-of-Custody records for soil samples are included in Attachment G.

Grab Groundwater Sampling

Depth discrete groundwater samples were also collected from each boring for laboratory analysis. To collect the groundwater samples from direct-push boreholes, a Hydropunch® sampling device was advanced to the bottom of the borehole, then the drive casing was pulled back to expose the screen and allow water to enter the boring. During advancement of each CPT boring, the CPT data was reviewed and groundwater sampling intervals were selected, based on the interpreted silty sand layers within the stratigraphic column and pore-pressure dissipation test data. Gregg advanced a Hydropunch® sampling device in a hole adjacent to the CPT hole in an attempt to collect groundwater samples at the selected depth intervals. The sampling tool was left open at each selected depth interval to allow groundwater to accumulate. Table 7 lists the groundwater sample depth intervals and sampling attempts at each location.

Groundwater was collected with a stainless steel bailer and poured into 40-ml preserved volatile organic analysis vials and 1-L amber glass bottles, which were put into an ice-filled cooler. All samples were handled and transported under Chain-of-Custody protocol. Groundwater sample collection protocols using a Hydropunch® are described in Attachment E.

Groundwater Sample Analytical Results

Grab groundwater samples were collected from the direct-push borings at 12 feet bgs. One grab groundwater samples was collected at boring CPT1 at 18 feet bgs and at boring CPT5 at 10 feet bgs. Two grab groundwater samples were collected at borings CPT2 through CPT4, and CPT6; a shallow sample at 10 feet bgs; and four deeper samples at 24 feet bgs, 26 feet bgs, 29 feet bgs, and 30 feet bgs.

The grab groundwater samples were analyzed by TestAmerica for TPHg and TPHd using EPA Method 8015; BTEX using EPA Method 8021B; fuel oxygenates and lead scavengers using EPA Method 8260B.

In the shallow grab groundwater samples, LPH was observed in sample collected from boring CPT2 with TPHg and benzene detected at concentrations of 1,060,000 µg/L and 1,380 µg/L, respectively (CPT2, 10 feet). In the remaining shallow grab groundwater samples TPHg was detected at concentrations up to 42,400 µg/L (DP4, 12 feet); TPHd was detected at concentrations up to 182,000 µg/L (DP5, 12 feet); benzene was detected at concentrations up to 7,000 µg/L (DP4, 12 feet); and MTBE was detected at concentrations up to 146 µg/L (DP1, 12 feet). The benzene concentrations in the shallow water samples indicate that this is an older release of petroleum hydrocarbons.

In the deeper grab groundwater samples TPHg was detected at concentrations up to 1,240 µg/L (CPT3, 29 feet); TPHd was detected at concentrations up to 473 µg/L (CPT6, 30 feet); benzene was detected in one sample at a concentrations of 0.50 µg/L (CPT4, 24 feet); and MTBE was detected at concentrations up to 299 µg/L (CPT2, 26 feet).

Analytical results are summarized in Table 4. Sampling results for TPHd, TPHg, benzene, and MTBE are posted on Plate 9 along with the results from the May 2, 2005 quarterly groundwater monitoring event. Isoconcentration maps for TPHd, TPHg, benzene, and MTBE are presented on Plates 10 through 13, respectively. The laboratory analytical reports and Chain-of-Custody records for grab groundwater samples are included in Attachment G.

Surveying of CPT and Soil Boring Locations

The location of each soil boring and CPT location was surveyed for ground surface elevation and northing and easting coordinates by Morrow Surveying, of West Sacramento, California. The northing and easting coordinates are California State Plane Zone 3 coordinates from GPS observations using University of California Bay Area Deformation Cors Station Observation Files and based on the California spatial reference center datum, reference epoch 2000.35. Elevations are based on the City of Oakland

Benchmark #12; a monument in a box at walkway with an elevation of 16.76. A copy of the surveyors report is provided in Attachment H.

Waste Containment and Disposal

Rinsate water and soil cuttings were collected in three 55-gallon drums, labeled and are temporarily stored on site. ERI collected four soil samples that were subsequently composited by the laboratory into one sample and analyzed for TPHg, BTEX, and total lead to determine appropriate disposal at an Exxon Mobil-approved facility.

ASSESSMENT OF HISTORICAL AND RECENT SOIL AND GROUNDWATER DATA

Historical and Recent Soil Sample Analytical Results

Soil sample locations are shown on Plates 2A and 2B. Cumulative soil sample analytical results are summarized in Tables 2A and 2B. TPHd, TPHg, benzene, and MTBE results are presented on Plate 8. The geologic cross-sections are presented on Plates 5 and 6. A total of 113 soil samples have been collected from 46 soil boring locations at depths ranging from 2.0 to 18 feet bgs; and a total of 42 soil samples were collected from product line trenches, the old tank pit excavation, and the new tank pit excavation at depths ranging from 3.0 to 16 feet bgs.

Extent of Petroleum Hydrocarbon Impact to Soil

Based on a review of the cumulative soil sample results, residual hydrocarbons in soil appear to be concentrated in the southern portion of the site in the vicinity of the former USTs and on the southwestern portion of the site adjacent to Coliseum Way.

Most of the soil samples were collected prior to the operation of the soil and groundwater remediation systems, with the exception of the investigation conducted in April 2005. Comparison of the analytical results from soil samples collected during the 2005 investigation with the analytical results from soil samples collected at nearby locations prior to operation of the remediation systems show that residual hydrocarbon concentrations have mostly decreased for TPHd, TPHg, and benzene.

- Soil boring DP6 was advanced in the area of the former UST location; ERI considers the soil samples from this location give an indication of the quality of the fill used. Benzene and TPHg were not detected in the DP6 soil samples; however, TPHd was detected at a maximum concentration of 36.4 mg/kg.
- The vertical and lateral extent of residual petroleum hydrocarbons in soil is defined on the northern portion of the site (north of the existing fuel dispensers) at borings MW8, MW10, MW11, MW13, B26, and CPT5.
- The vertical and lateral extent of residual petroleum hydrocarbons in soil is defined on the eastern portion of the site (east of the existing station building) at borings CPT6 and DP3.
- The lateral extent of residual petroleum hydrocarbons in soil is considered defined west of the current dispenser islands at borings DP1, DP4, CPT2 and CPT4; however, the vertical extent is not considered defined to the west of the current dispenser islands, based on the detections of benzene (4.78 mg/kg) and TPHg (1,190 mg/kg) at DP1 (10.5 feet).
- The vertical and lateral extent of residual petroleum hydrocarbons (except TPHd) is considered defined on the southern portion of the site (south of the dispenser islands and west of the former USTs) at boring CPT1 and to the southwest at boring CPT3, but not defined at boring DP5.
- The vertical and lateral extent of residual petroleum hydrocarbons as TPHd on the southern portion of the site (south of the dispenser islands and south southwest of the former USTs) is not defined at boring locations DP5, CPT1, and CPT3. The highest concentration of TPHd in soil was detected at a concentration of 12,000 mg/kg (DP5, 2 feet). The concentration of TPHd decreases with depth and was detected at a concentration of 875 mg/kg (DP5, 10.5 feet).

Historical and Recent Groundwater Sample Analytical Results

Quarterly groundwater monitoring was conducted from April 1989 until December 1999. Since March 2000, groundwater monitoring has been conducted at least annually. Quarterly groundwater monitoring data from 1989 to 1994 is presented in Attachment B and groundwater monitoring data since 1994 is summarized in Tables 1A and 1B. The grab groundwater results from the recent site investigation are summarized in Table 4. The TPHg, TPHd, benzene, and MTBE results for the May 2005 quarterly groundwater monitoring event and the grab groundwater samples collected during the April 2005 investigation are shown on Plate 9. The groundwater monitoring report was submitted under separate cover.

Currently there are six groundwater monitoring wells (MW2, MW3, MW4, MW6, MW12, and MW14), four groundwater extraction wells (RW1 through RW4), one vapor well (VW1), and six air sparge wells (AS1 through AS6) located on site and one groundwater monitoring well (MW1) located off site. Based on the groundwater grab results from the most recent investigation as described in Recent Site Investigation section and the most recent quarterly groundwater monitoring event conducted on May 2, 2005, current concentrations of dissolved hydrocarbons beneath the subject site include TPHg detected at a maximum concentration of 1,060,000 µg/L (CPT2, 10 feet); TPHd detected at a maximum concentration of 182,000 µg/L (DP5, 12 feet); benzene detected at a maximum concentration of 7,000 (DP4, 12 feet); and MTBE detected at a maximum concentration of 299 µg/L (CPT2, 26 feet).

Hydrographs presenting groundwater elevations over time, and TPHg, benzene, and MTBE concentrations since 1994 are included for wells MW1 through MW4, and MW6 through MW15 (Attachment D). The hydrographs indicate that petroleum hydrocarbons are generally stable or decreasing in the monitoring wells.

Extent of Petroleum Hydrocarbon Impact to Groundwater

Dissolved-phase petroleum hydrocarbons in groundwater appear to be concentrated in the vicinity of the former USTs and west southwest of the current dispenser island. Isoconcentration maps of dissolved TPHd, TPHg, benzene, and MTBE detected in groundwater samples collected during the second quarter 2005 groundwater monitoring event and the April 2005 site investigation are presented on Plates 10 through 13.

As shown on Plate 10, the lateral extent of TPHd is not defined (1) to the south at boring CPT3 (76,800 µg/L); (2) to the east at boring DP3 (11,100 µg/L); (3) to the north at boring CPT5 (5,520 µg/L) and well MW14 (2,590 µg/L); (4) and to the west at boring CPT4 (15,700 µg/L) and boring DP1 (23,000 µg/L).

As shown on Plate 11, the lateral extent of TPHg is defined to the southeast at boring CPT1 (<50 µg/L) and boring DP6 (<50 µg/L). The lateral extent of TPHg is not defined (1) to the southwest at boring CPT3 (358 µg/L); (2) to the east at boring DP3 (2,200 µg/L); to the north at boring CPT5 (2,200 µg/L) and well MW14 (363 µg/L); (4) and to the west at boring CPT4 (10,600 µg/L) and boring CPT2 (1,060,000 µg/L).

As shown in Plate 12, the lateral extent of benzene is defined (1) to the south at well MW1 (<0.50 µg/L) and boring CPT3 (<0.50 µg/L); (2) to the southeast at boring CPT1 (<0.50 µg/L) and boring DP6 (<0.50 µg/L)); (3) and to the east at boring CPT6 (<0.50 µg/L). The lateral extent of benzene is not defined (1) to the north at boring CPT5 (13.2 µg/L); and (2) to the west at boring CPT4 (233 µg/L) and boring CPT2 (1,380 µg/L).

As shown in Plate 13, the lateral extent of MTBE is defined to the north and northeast by borings CPT5, CPT6, DP3, DP6, and wells MW6, MW14; MTBE was not detected above the laboratory reporting limit at these locations.

The highest concentration of MTBE was detected west of the current dispenser islands in boring DP1 (146 µg/L) and southwest of the site in well MW1 (138 µg/L). Based on the historical MTBE concentrations (analyzed by EPA Method 8260B) and the lack of receptors in the vicinity of the site, the extent of MTBE in groundwater has been adequately defined. Earlier MTBE data analyzed by EPA Method 8020 may be biased high due to the concentrations of TPHg and TPHd in the samples.

Liquid-Phase Hydrocarbons

Measurable LPH was detected in wells MW3, MW4, MW6, VW2, and VW3 in the area of the former USTs and in wells MW2 and MW8 in the area of the former product piping from 1989 through 1994.

Hydrocarbon sheen has also been identified in wells MW1, MW5, MW7, MW12, MW13, and MW15.

Hydrocarbon sheen was most recently observed in wells MW8, MW12, and MW13 in June 1999. LPH was observed in water samples collected from boring CPT2 in April 2005. Approximately 27 gallons of LPH was removed in July and August 1989 from wells MW2, MW3, MW4, and MW8 (Attachment B). Approximately 6.3 gallons of LPH were removed in February and March 1993 (RESNA 1993b).

SENSITIVE RECEPTOR SURVEY

The original SRS was completed in 1989. ERI reviews and updates the SRS data annually. The most recent SRS update for the site was April 13, 2004. The SRS update included a file review, a utility survey, and a field reconnaissance. ERI conducted a file review of the Department of Water Resources (DWR) well driller's report archive to search for wells located within a 2,000-foot radius of the site. The field work included a visual survey to identify utility vaults and storm drains within the immediate vicinity of the site. ERI also conducted a reconnaissance of the area within a 2,000-foot radius of the site for wells not identified by the DWR file review, and for surface bodies of water, basements, and subway tunnels. A Sensitive Receptor Map is included as Plate 14.

Municipal and Private Water Wells

The DWR well driller's report archive search revealed no water-producing wells registered within a 2,000-foot radius of the site. ERI did not discover any water wells during the field reconnaissance.

Surface Water Bodies

Based on a map review, one surface water body was located within a 2,000-foot radius of the site. Oakland Estuary Tidal Canal is located approximately 1,900 feet west to southwest of the site.

Utility Vaults, Storm Drains, and Underground Utility Lines

Fourteen utility vaults, including 2 storm drains, are located on and adjacent to the site. Several utility trenches are located on and adjacent to the site; including PGE Subsurface Gas & Electrical Lines, EBMUD Potable Water Lines, City of Oakland Office of Public Works Sanitary Sewer Lines, Southern Pacific underground fuel lines, and Pacific Bell Subsurface Communication Lines. ERI requested additional utility line information from the utility companies, but have not received the information. Without the utility line trench depth information ERI is unable to determine the potential for the trenches to be impacted by petroleum hydrocarbons. The locations of the known utility lines are shown on Plate 15.

Basements and Tunnels

Based on a visual reconnaissance of the site vicinity, no buildings with basements or subway tunnels were observed within a 2,000-foot radius of the subject site. Based on the visual observations, typical construction in this area does not include basements or cellars for buildings.

Schools, Hospitals, and Day Care Centers

There are two schools located within 2000-foot radius of the site. Oakland Charter Academy is located 1,990 feet south of the site. Dewey Senior High School is located approximately 1,990 feet north of the site.

SOURCE IDENTIFICATION, EXPOSURE PATHWAYS, AND RISK EVALUATION

Release History

There are several potential offsite sources for the petroleum hydrocarbons detected at the site, including the former auto wrecking yard, the former dry cleaning plant, and the Southern Pacific fuel pipeline. The following observations summarize information regarding the location of releases of petroleum hydrocarbons and related constituents at the site:

- From 1912 to 1934, Standard Oil Company of California (currently known as Chevron U.S.A.) operated an oil storage and distribution facility on the southwestern part of the site. Up to six aboveground storage tanks were on site during this period.
- Prior to 1970, the site was also used as a dump site.
- In April 1987, the USTs were removed. Residual hydrocarbons were detected at concentrations greater than 1,000 mg/kg in soil samples collected from the gasoline UST pit. Removal of the product and vapor piping revealed a black impacted layer of soil approximately 2 to 3 feet deep that appeared to contain relatively high hydrocarbon concentrations.

- In May 1987, the gasoline UST pit was over excavated to a depth of 14 feet bgs, the depth at which groundwater was encountered. A black oily viscous fluid was observed seeping from the southwestern wall of the gasoline UST excavation, at a depth of approximately 12 feet bgs. Liquid-phase hydrocarbons were found floating on top of the groundwater at the bottom of the gasoline pit.
- Between May and July 1987, approximately 760 cubic yards of soil was excavated, aerated, and subsequently disposed off site.
- In July 1989, well MW5 was destroyed so that additional soil could be excavated from the southern part of the former gasoline UST pit. Before excavation began, approximately 13,000 gallons of water that had accumulated in the tank pit was pumped into aboveground tanks and later disposed off site. Approximately, 300 cubic yards of soil and debris (including bricks and lumber) were excavated from the southern and southwestern sides of the pit as far towards Coliseum Way as possible. In addition, a concrete structure that appeared to be an old dispenser island was uncovered just southeast of well MW5. Piping containing an oily substance (which appeared to be former product lines) extended from the dispenser island towards Coliseum Way.
- Between 1989 and 1991, measurable LPH and or hydrocarbon sheen was observed in wells MW1 through MW8.
- In January 1991, approximately 500 cubic yards of soil was excavated from the northwestern corner of the site for the new UST pit. Concentrations of TPHg were detected up to 53 mg/kg in soil samples collected from the walls and floor of the pit. Benzene was detected in one floor soil sample at a concentration of 0.007 mg/kg and TPHd was not detected in any of the excavation soil samples.
- In March 2003, the maximum concentration of MTBE analyzed by EPA Method 8260B was detected in groundwater samples collected from monitoring well MW2 at 428 µg/L. Groundwater samples were not analyzed for MTBE prior to 1994. From approximately 1994 through 2001 groundwater samples were analyzed for MBTE by EPA Method 8020/8021B.
- In April and May 2005, the highest dissolved-phase petroleum hydrocarbons were detected in grab groundwater samples collected downgradient of the dispenser islands and former UST location.

Based on these observations, ERI concludes:

- A release most likely occurred on southwestern part of the site when an oil storage and transfer facility operated at the site, prior to the construction of the Exxon Service Station in 1970.
- A release most likely occurred from the old USTs prior to 1987.
- A release most likely occurred from the former dispensers, former product piping prior to 1987. In 1989, up to 1.25 feet of LPH measured in well MW8 (located downgradient of the current UST field installed in 1991).
- A release most likely occurred from abandoned piping and what appeared to be an old dispenser island discovered during 1989 extended excavation.
- A release of petroleum hydrocarbons (including MBTE) most likely occurred after the property transfer from Exxon Mobil to the Victor and Lye Kyin Chu in 1987.

Constituents of Concern

Diesel hydrocarbons (as TPHd), gasoline hydrocarbons (as TPHg), BTEX compounds, and MTBE have been identified as constituents of concern (COCs) warranting additional evaluation at and near the subject site.

Based on previously documented site usage, these chemicals are consistent with those handled and used at the site with the exception of TPHd. The source for the TPHd impact is unknown since Exxon Mobil did not use the former tanks to store diesel fuel (AGS 1989a).

Potential Sources

Potential primary source COCs that could impact human health or the environment include the current UST and dispensing system, dissolved-phase petroleum hydrocarbons, and mobile LPH in the shallow water-bearing zone. The current UST and dispensing system currently owned and operated by an independent dealer is not currently known to leak. Mobile LPH has not been observed in monitoring wells on the site since mid 1999; however, based on the LPH observed in the shallow grab groundwater sample analyzed from boring CPT2, it is present off site. During excavation in 1987 and 1989, impacted soil was noted to extend from the former UST pit to the west, southwest, and south (AGS 1989a).

Potential secondary sources of COCs that could impact human health and the environment include:

- Residual COCs in unsaturated vadose sediment;
- Residual COCs and immobile LPH in depth interval of historical groundwater fluctuation;
- Dissolved-phase COCs in groundwater; and
- Vapor-phase COCs in vadose sediment.

Exposure Pathways

Based on the cumulative results of soil and groundwater analyses, surface and subsurface soil, groundwater, and soil vapor underlying the site represent impacted media. Potential transport mechanisms include the following:

- Unsaturated LPH flow through vadose zone soil and underground utility trenches.
- Saturated LPH flow through vadose zone soil and through underground utility trenches.
- Unsaturated flow of groundwater with dissolved-phase COCs through vadose soil.
- Saturated flow of groundwater with dissolved-phase COCs (advection transport) through soil.
- Migration of soil vapor through vadose zone soil into outdoor and indoor air.
- Atmospheric dispersion of vapor-phase COCs.
- Wind transport of particulate soil with adsorbed COCs.

Properties in the vicinity of the site are occupied by commercial business; therefore commercial land use and exposure scenarios are most applicable to this site. However, based on stated Regional Board policy regarding use of residential exposure criteria, ERI also evaluated risk to residential receptors. Because no water supply wells have been identified near the site, ERI does not consider groundwater ingestion as an

open exposure pathway, and applied non-drinking water source criteria. Based on the proximity of the Oakland Estuary Tidal Canal approximately 1,900 feet southwest of the site, ERI considers groundwater transport to surface water as an open pathway, and has applied estuarine exposure criteria.

Comparison of Current Site Conditions to Environmental Screening Levels

Current concentrations of dissolved hydrocarbons, and the maximum reported concentrations of residual hydrocarbons were compared to the environmental screening levels (ESLs) issued by the California Regional Water Quality Control Board, San Francisco Bay Region (Regional Board, 2005). ERI compared concentrations of residual and dissolved hydrocarbons to ESLs for commercial and residential land use.

Dissolved Concentrations

ERI compared the maximum concentrations of TPHg, TPHd, BTEX, and MTBE detected in grab groundwater samples collected during the recent investigation in April 2005 and in groundwater samples from monitoring collected during the May 2, 2005 monitoring and sampling event to select ESLs for groundwater sources. ERI compared the maximum dissolved concentrations to ESLs for indoor air impact for commercial land use, estuary aquatic habitat goal for surface water, the groundwater ceiling value (taste and odor) for groundwater that is not a current or potential drinking water resource, and indoor air impact for residential land use. A summary of the maximum concentrations and ESLs for groundwater sources is provided in Table 8.

The maximum concentrations detected in groundwater during the April 2005 groundwater assessment and the May 2005 monitoring and sampling event exceed the following ESLs:

- Estuary aquatic habitat goal for surface water for BTEX, TPHg, and TPHd;
- The ceiling value where groundwater is not a current or potential drinking water resource for toluene, ethylbenzene, TPHg and TPHd;
- The indoor air impact for commercial and residential land use for benzene.

Residual Soil Concentrations

ERI compared the maximum reported concentration of residual TPHg, TPHd, BTEX, and MTBE detected in shallow (above 10 feet bgs) and deep (below 10 feet bgs) soil samples collected at the subject site during April 2005 assessment to select ESLs for soil sources. ERI compared these concentrations to ESLs for direct expose to human health for commercial and residential land use; groundwater protection (soil leaching) for non-drinking water resource for commercial and residential land use; and potential indoor air impact for commercial and residential land use. A summary of the maximum concentrations and ESLs for soil sources above 10 feet bgs and below 10 feet bgs are provided in Tables 9 and 10, respectively.

The maximum concentrations detected in soil above 10 feet bgs during the April 2005 assessment exceed the following ESLs:

- Direct exposure to human health for commercial land use for benzene and TPHd;
- Groundwater protection (soil leaching) non-drinking water resource for commercial and residential land use for benzene, total xylenes, TPHg, and TPHd;
- Potential indoor air impact for commercial land use for benzene,
- Direct exposure to human health for residential land use for benzene, TPHg and TPHd;
- Groundwater protection (soil leaching) non-drinking water resource for residential land use for benzene, total xylenes, TPHg, and TPHd;
- Potential indoor air impact for residential land use for benzene.

The maximum concentrations detected in soil during the April 2005 assessment below 10 feet bgs exceed the following ESLs:

- Groundwater protection (soil leaching) non-drinking water resource for commercial land use for benzene, total xylenes, TPHg, and TPHd;
- Potential indoor air impact for commercial land use for benzene;
- Groundwater protection (soil leaching) non-drinking water resource for residential land use for benzene, total xylenes, TPHg, and TPHd;
- Potential indoor air impact for residential land use for benzene.

SUMMARY AND CONCLUSIONS

Based on the information available to date, the following conclusions are presented.

- The site is an active service station and is paved with asphalt. Land use at the site and in the vicinity is predominately industrial since 1912. The site has had several industrial uses since 1912, including a bulk plant, a dump, and a service station.
- Investigations have been conducted at the site since 1987.
- There are several other reported sources including a former wrecking yard, and a fuel pipeline in the vicinity that may be responsible for the petroleum hydrocarbon concentrations detected in soil and groundwater on site and off site.
- The TPHd concentrations detected in soil and groundwater are likely not a result of Exxon Mobil's fuel dispensing activities at the site. The TPHd concentrations may be a result of adjacent releases or a release prior to Exxon Mobil's site operations.
- The CPT lithologic data does not correlate well with the previous soil boring and monitoring well logs.
- Cumulative soil analytical data indicate that TPHg and benzene concentrations in soil have decreased and that remedial activities were effective.
- Cumulative groundwater analytical data indicate that the remedial activities have reduced hydrocarbon concentrations in groundwater onsite and that natural attenuation may be continuing.
- There are no known sensitive receptors that are likely to be impacted by petroleum hydrocarbons. There is insufficient data to determine if the utility line trenches in the vicinity of the site are likely to be impacted by petroleum hydrocarbons.
- The lateral extent of TPHd, TPHg, benzene, in soil has not been determined on the southern portion of the site west of the former USTs.
- The lateral extent of TPHd, TPHg, benzene, in groundwater has not been determined to the west and southwest of the site.
- The shallow and deeper soil and groundwater concentrations exceed several residential and commercial ESLs for the site.

RECOMMENDATIONS

ERI recommends:

- Additional assessment of the lithologic discrepancies between the CPT data and the previous soil boring and monitoring well logs.
- Additional assessment to the northwest, west, and southwest of the site to investigate the lateral and vertical distribution of dissolved TPHd, TPHg, and benzene in groundwater, and in the vicinity of CPT2 to evaluate the existence, persistence and extent of LPH.
- Additional investigation of the locations and depths of the utility trenches in Coliseum Way to assess if the trenches are at depth where they could be impacted by petroleum hydrocarbons or provide preferential pathways for petroleum hydrocarbon transportation.

DOCUMENT DISTRIBUTION

ERI recommends forwarding copies of this report to:

Notes:

W-12-DP6	=	Water - Sample Depth - Sample Location.
SUBJ	=	Results of subjective evaluation, liquid-phase hydrocarbon thickness in feet.
NLPH	=	No liquid-phase hydrocarbons present in well.
TOC	=	Elevation of top of well casing; relative to mean sea level.
DTW	=	Depth to water.
Elev.	=	Elevation of groundwater. If liquid-phase hydrocarbons present, elevation adjusted using TOC - [DTW - (PT x 0.8)].
[]	=	Amount recovered.
gal.	=	Gallons.
TPHd	=	Total petroleum hydrocarbons as diesel analyzed using EPA Method 3510/8015 (modified).
TPHg	=	Total petroleum hydrocarbons as gasoline analyzed using EPA Method 5030/8015 (modified).
MTBE 8021B	=	Methyl tertiary butyl ether analyzed using EPA Method 8021B.
MTBE 8260B	=	Methyl tertiary butyl ether analyzed using EPA Method 8260B.
BTEX	=	Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8021B.
TOG	=	Total oil and grease analyzed using Standard Method 5520.
EHCss	=	Extractable Hydrocarbons as Stoddard Solvent analyzed using EPA Method 8015.
EDB	=	1,2-Dibromoethane analyzed using EPA Method 8260B.
1,2-DCA	=	1,2-Dichloroethane analyzed using EPA Method 8260B.
TAME	=	Tertiary amyl methyl ether analyzed using EPA Method 8260B.
TBA	=	Tertiary butyl alcohol analyzed using EPA Method 8260B.
ETBE	=	Ethyl tertiary butyl ether analyzed using EPA Method 8260B.
DIPE	=	Di-isopropyl ether analyzed using EPA Method 8260B.
µg/L	=	Micrograms per liter.
—	=	Not measured/Not analyzed.
<	=	Less than the indicated reporting limit shown by the laboratory.
a	=	A peak eluting earlier than benzene, suspected to be MTBE, was present.
b	=	Sample containers for TPHg, BTEX, and MTBE were broken in transit.
c	=	Chromatogram pattern: unidentified hydrocarbons C6 - C12.
d	=	Chromatogram pattern: weathered gasoline C6 - C12.
e	=	Chromatogram pattern: weathered gasoline C6 - C12 and unidentified hydrocarbons C6 - C12.
f	=	Chromatogram pattern: weathered diesel C9 - C24 and unidentified hydrocarbons C9 - C36.
g	=	Chromatogram pattern: unidentified hydrocarbons C9 - C24.
h	=	Diesel result is not consistent with diesel fuel.
j	=	Well inaccessible.
k	=	TPHd note: Analyst notes samples resemble paint thinner more than Stoddard Solvent.
l	=	Analyte detected in trip blank and/or bailer blank; result is suspect.
m	=	Higher reported TPH concentrations in groundwater may be due to different laboratory quantitation procedures.

TABLE 1B
ADDITIONAL CUMULATIVE GROUNDWATER MONITORING AND SAMPLING DATA
Former Exxon Service Station 7-3006
720 High Street
Oakland, California
(Page 3 of 3)

Well ID #	Sampling Date	ETBE	TAME	TBA	EDB	1,2-DCA	DIPE	Ethanol	EHCss	TOG
MW15	01/20/94 - 12/21/00: Not analyzed for these analytes.	<				ug/L				>
	12/21/00		Well destroyed.							

Notes:

W-12-DP6	=	Water - Sample Depth - Sample Location.
SUBJ	=	Results of subjective evaluation, liquid-phase hydrocarbon thickness in feet.
NLPH	=	No liquid-phase hydrocarbons present in well.
TOC	=	Elevation of top of well casing; relative to mean sea level.
DTW	=	Depth to water.
Elev.	=	Elevation of groundwater. If liquid-phase hydrocarbons present, elevation adjusted using TOC - [DTW - (PT x 0.8)].
[]	=	Amount recovered.
gal.	=	Gallons.
TPHd	=	Total petroleum hydrocarbons as diesel analyzed using EPA Method 3510/8015 (modified).
TPHg	=	Total petroleum hydrocarbons as gasoline analyzed using EPA Method 5030/8015 (modified).
MTBE 8021B	=	Methyl tertiary butyl ether analyzed using EPA Method 8021B.
MTBE 8260B	=	Methyl tertiary butyl ether analyzed using EPA Method 8260B.
BTEX	=	Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8021B.
TOG	=	Total oil and grease analyzed using Standard Method 5520.
EHCss	=	Extractable Hydrocarbons as Stoddard Solvent analyzed using EPA Method 8015.
EDB	=	1,2-Dibromoethane analyzed using EPA Method 8260B.
1,2-DCA	=	1,2-Dichloroethane analyzed using EPA Method 8260B.
TAME	=	Tertiary amyl methyl ether analyzed using EPA Method 8260B.
TBA	=	Tertiary butyl alcohol analyzed using EPA Method 8260B.
ETBE	=	Ethyl tertiary butyl ether analyzed using EPA Method 8260B.
DIPE	=	Di-isopropyl ether analyzed using EPA Method 8260B.
µg/L	=	Micrograms per liter.
--	=	Not measured/Not analyzed.
<	=	Less than the indicated reporting limit shown by the laboratory.
a	=	A peak eluting earlier than benzene, suspected to be MTBE, was present.
b	=	Sample containers for TPHg, BTEX, and MTBE were broken in transit.
c	=	Chromatogram pattern: unidentified hydrocarbons C6 - C12.
d	=	Chromatogram pattern: weathered gasoline C6 - C12.
e	=	Chromatogram pattern: weathered gasoline C6 - C12 and unidentified hydrocarbons C6 - C12.
f	=	Chromatogram pattern: weathered diesel C9 - C24 and unidentified hydrocarbons C9 - C36.
g	=	Chromatogram pattern: unidentified hydrocarbons C9 - C24.
h	=	Diesel result is not consistent with diesel fuel.
j	=	Well inaccessible.
k	=	TPHd note: Analyst notes samples resemble paint thinner more than Stoddard Solvent.
l	=	Analyte detected in trip blank and/or bailer blank; result is suspect.
m	=	Higher reported TPH concentrations in groundwater may be due to different laboratory quantitation procedures.

Notes:

- S-2-CPT1 = Soil - Sample Depth - Sample Location.
- TPHd = Total petroleum hydrocarbons as diesel analyzed using EPA Method 8015B.
- TPHg = Total petroleum hydrocarbons as gasoline analyzed using EPA Method 8015B.
- MTBE = Methyl tertiary butyl ether analyzed using EPA Method 8260B.
- BTEX = Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8021B.
- ETBE = Ethyl tertiary butyl ether analyzed using EPA Method 8260B.
- TAME = Tertiary amyl methyl ether analyzed using EPA Method 8260B.
- TBA = Tertiary butyl alcohol analyzed using EPA Method 8260B.
- 1,2-DCA = 1,2-Dichloroethane analyzed using EPA Method 8260B.
- EDB = 1,2-Dibromoethane analyzed using EPA Method 8260B.
- DIPE = Di-isopropyl ether analyzed using EPA Method 8260B.
- (ft bgs) = Feet below ground surface.
- mg/Kg = Milligrams per Kilogram.
- < = Less than the stated reporting limit.
- a = TPHd result was not consistent with diesel fuel.
- b = Hydrocarbons greater than C22 were detected. 460 mg/Kg Oil and Grease by SM5520 detected.
- c = Data missing from historical files.

Notes:

- S-2-CPT1 = Soil - Sample Depth - Sample Location.
- TPHd = Total petroleum hydrocarbons as diesel analyzed using EPA Method 8015B.
- TPHg = Total petroleum hydrocarbons as gasoline analyzed using EPA Method 8015B.
- MTBE = Methyl tertiary butyl ether analyzed using EPA Method 8260B.
- BTEX = Benzene, toluene, ethylbenzene, and total xylenes analyzed using EPA Method 8021B.
- ETBE = Ethyl tertiary butyl ether analyzed using EPA Method 8260B.
- TAME = Tertiary amyl methyl ether analyzed using EPA Method 8260B.
- TBA = Tertiary butyl alcohol analyzed using EPA Method 8260B.
- 1,2-DCA = 1,2-Dichloroethane analyzed using EPA Method 8260B.
- EDB = 1,2-Dibromoethane analyzed using EPA Method 8260B.
- DIPE = Di-isopropyl ether analyzed using EPA Method 8260B.
- (ft bgs) = Feet below ground surface.
- mg/Kg = Milligrams per Kilogram.
- < = Less than the stated reporting limit.
- a = TPHd result was not consistent with diesel fuel.
- b = Hydrocarbons greater than C22 were detected. 460 mg/Kg Oil and Grease by SM5520 detected.
- c = Data missing from historical files.

07/28/99	System shut down for pulsing													

Notes:

A-INF = Air influent.
A-INT = Air intermediate.
A-EFF = Air effluent.
NA = Not analyzed.
cu. ft/min = Cubic feet per minute.
ppmv = Parts per million by volume.

HC = Hydrocarbons measured as total purgeable petroleum hydrocarbons as gasoline analyzed using EPA method 8015 (mcg/ug/l).
mg/cuM = Micrograms per liter.
lb acfm = Milligrams per cubic meter.
= Pounds.
acfm = Actual cubic feet per minute.
< = Less than the laboratory method detection limit.

*If value is below laboratory detection limit, detection limit value is used.

**Values calculated using ERI SOP-25: "Hydrocarbons Removed from a Vadose Well" (Attachment C)

Ms. Jennifer C. Sediachek
ExxonMobil Corporation
4096 Piedmont Ave. #194
Oakland, CA 94611

Re: Former Exxon Service Station 7-3006, 720 High St., Oakland CA 94601

Dear Ms. Sediachek:

Alameda County Environmental Health has received and reviewed the "December 9, 2004, Comparison of Environmental Screening Levels and Work Plan for Supplemental Evaluation of Soil and Groundwater Report", by Mr. Robert A. Saur of Environmental Resolution Inc., along with the remaining documents regarding the above referenced site.

I have also had several meetings and discussions with you and or your representatives as well as with Mr. Mashoon, the property owner, regarding the above referenced site. We request that you address the following technical comments, perform the proposed work, and send us the technical reports requested below.

TECHNICAL COMMENTS

- Per document in our files and the above report there were up to 30.8 ppb, 793 ppb, 3.6 ppb, 176 ppb, 53 ppb, 3,620 ppb, and 4,320 ppb of MTBE, Benzene, Toluene, EthylBenzene, Xylenes, TPHd, and TPHg respectively detected in groundwater during the last monitoring and sampling event. This analysis was performed to obtain a more recent current data regarding the above referenced site and its vicinity. The above workplan also compared ESL values to the COCs concentrations at the site for commercial scenario as applicable.
- Per above document there are number of areas where the concentrations of the constituents are above the ESL levels in soil and to some extent in groundwater. This must be addressed along with plume delineation before the case can be considered for closure.
- Develop and submit a Site Conceptual Model (SCM). This must include geological cross sections, Interpretive vertical and horizontal drawing of the

- plume (not just a plot of laboratory results), depth to groundwater, monitoring wells and screens, conduits, groundwater flow and locations of receptors, etc.
- Include a plot plan with all soil borings along with concentrations at different depths.
 - I concur with the above workplan. However, please ensure that your borings does not terminate at 12 feet but rather shall continue to at least 20 feet bgs.

TECHNICAL REPORT REQUEST

Please submit the following technical reports to Alameda County Department of Environmental Health (Attention: Amir K. Gholami):

March 17, 2004 Result of the Work Plan.

These reports are being requested pursuant to California Health and Safety Code Section 25296.10. 23 CCR Sections 2652 through 2654, and 2721 through 2728 outline the responsibilities of a responsible party in response to an unauthorized release from a petroleum UST system, and require your compliance with this request.

PERJURY STATEMENT

All work plans, technical reports, or technical documents submitted to ACEH must be accompanied by a cover letter from the responsible party that states, at a minimum, the following: "I declare, under penalty of perjury, that the information and/or recommendations contained in the attached document or report is true and correct to the best of my knowledge." This letter must be signed by an officer or legally authorized representative of your company. Please include a cover letter satisfying these requirements with all future reports and technical documents submitted for this fuel leak case.

UNDERGROUND STORAGE TANK CLEANUP FUND

Please note that delays in investigation, later reports, or enforcement actions may result in your becoming ineligible to receive grant money from the state's Underground Storage Tank Cleanup Fund (Senate Bill 2004) to reimburse you for the cost of cleanup.

Professional Certification

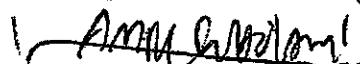

The California Business and Professions Code (Sections 6735, 6835, and 7835.1) requires that work plans and technical or implementation reports containing geologic or engineering evaluations and/or judgments be performed under the direction of an appropriately registered or certified professional. For your submittal to be considered a valid technical report, you are to present site specific data, data interpretations, and recommendations prepared by an appropriately licensed professional and include the professional registration stamp, signature, and statement of professional certification. Please ensure all that all technical reports submitted for this fuel leak case meet this requirement.

: AGENCY OVERSIGHT

If it appears as though significant delays are occurring or reports are not submitted as requested, we will consider referring your case to the Regional Board or other appropriate agency, including the County District Attorney, for possible enforcement actions. California Health and Safety Code, Section 25299.76 authorizes enforcement including administrative action or monetary penalties of up to \$10,000 per day for each day of violation.

If you have any questions, please do not hesitate to call me at 510-567-6876.

Sincerely,

Amir K. Gholami, REHS
Hazardous Materials Specialist

**HISTORICAL DATA TABLES, FIGURES,
AND 1989 CHRONOLOGY**

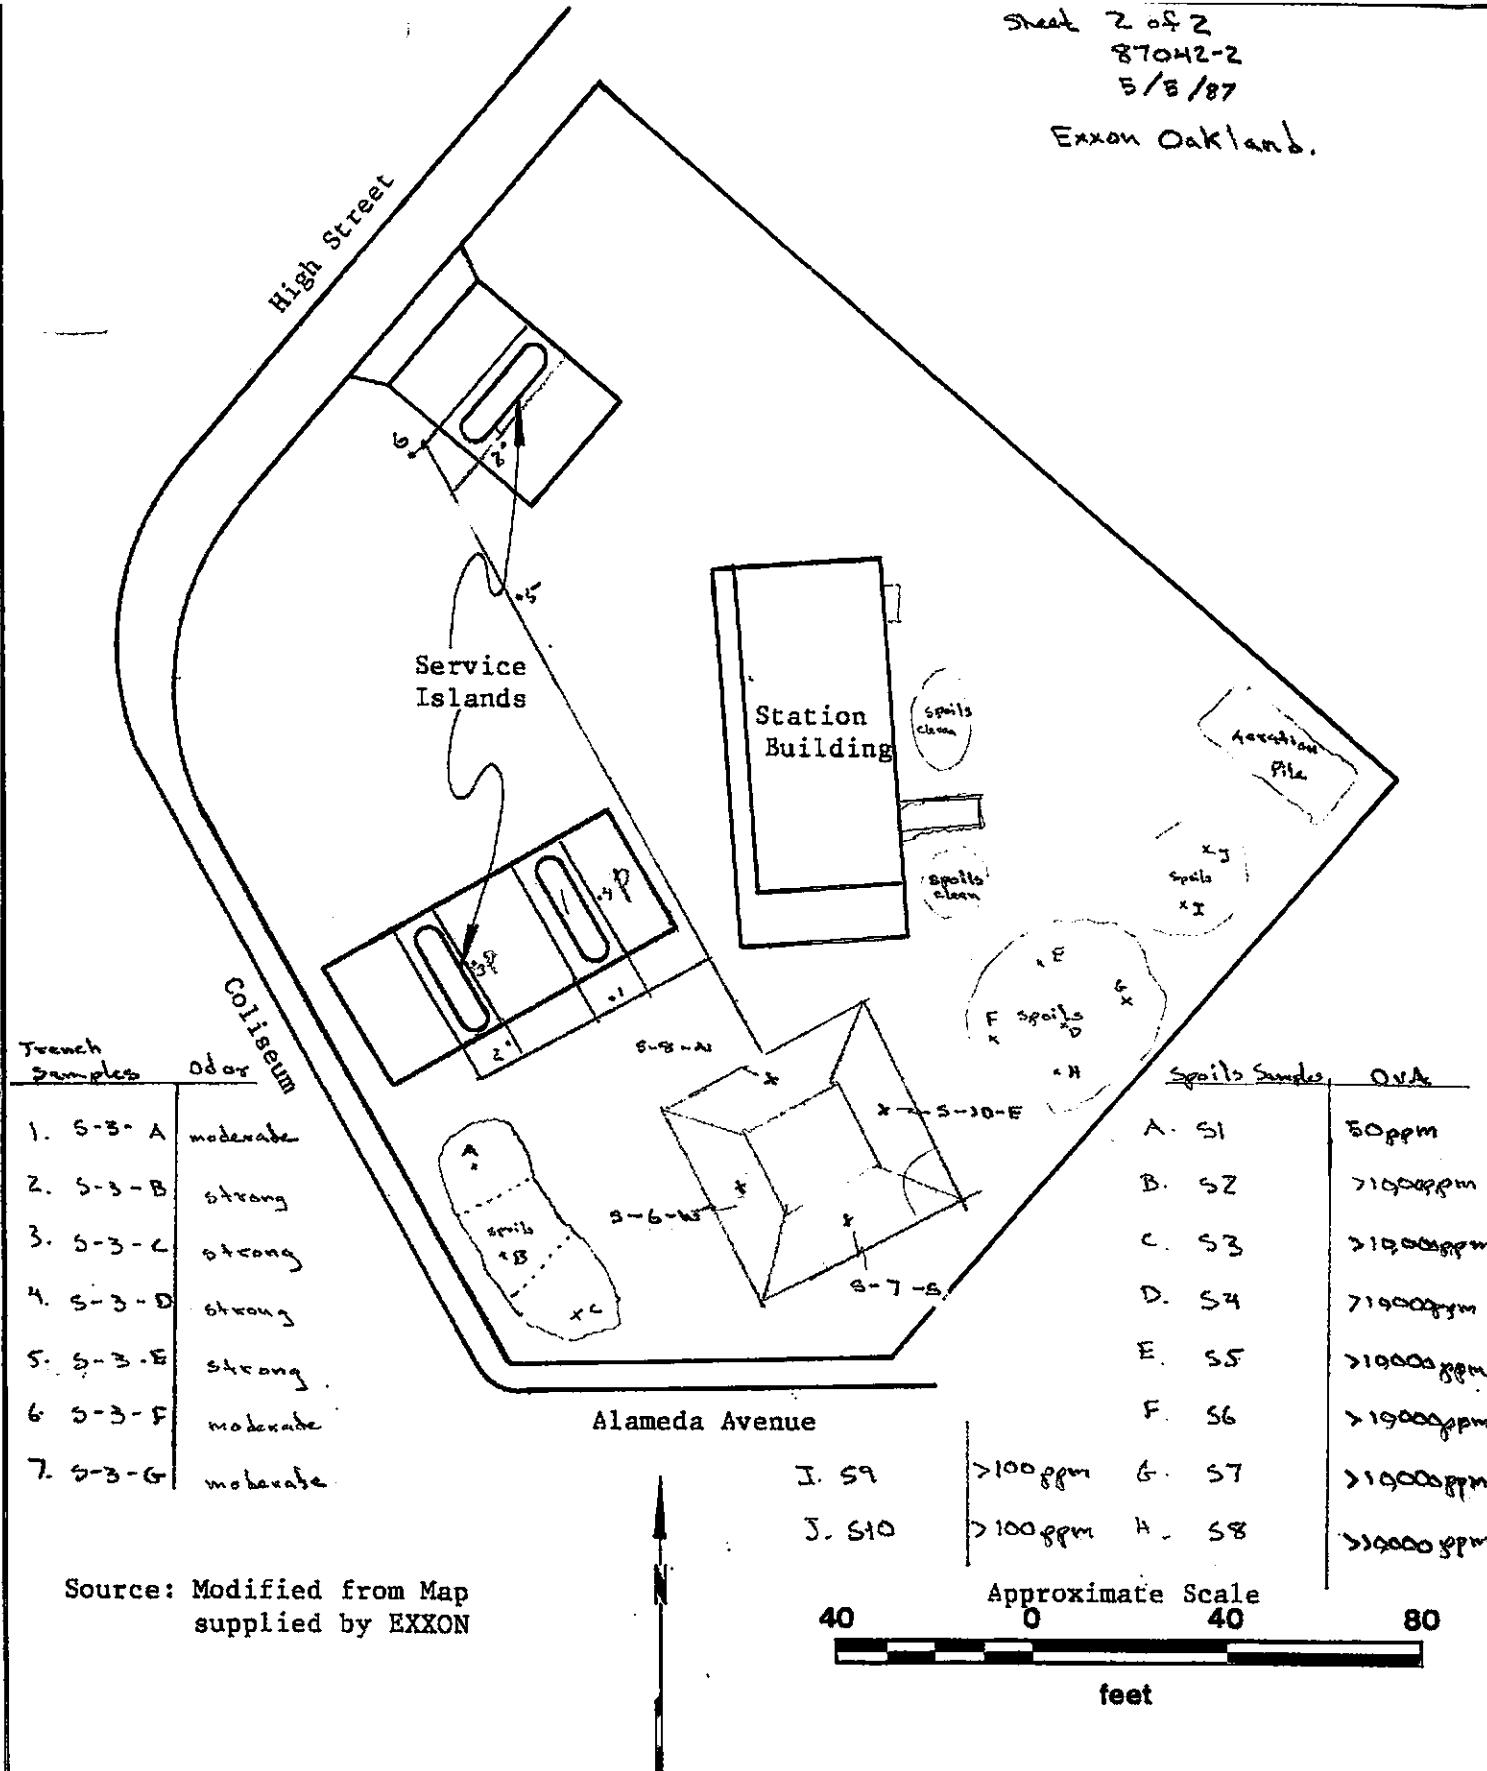

CHRONOLOGY OF EVENTS
EXXON STATION 7-3006
720 HIGH STREET, OAKLAND, CA
SEPTEMBER 20, 1989

- 5/29/89 Receive authorization from Exxon to proceed with extension of tank-pit excavation, installation of one offsite monitoring well.
- 6/7/89 Discuss permit requirements with City of Oakland Building Inspection and City of Oakland Fire Department.
- 6/9/89 Apply for permit for monitoring well installation from Alameda County Flood Control and Water Conservation District (Zone 7).
- 6/15/89 Request insurance certificate for City of Oakland permit.
- 6/23/89 Determine that location of offsite well is Caltrans property. Submit Caltrans encroachment permit.
- 7/6/89 Submit "notification of excavation of contaminated soil" form to Bay Area Air Quality Management District (BAAQMD). Apply for permit to destroy MW-5 from Alameda County Flood Control and Water Conservation District (Zone 7).
-
- 7/7/89 Receive insurance certificate for City of Oakland Excavation Permit. Apply for permit.
- 7/11/89 Caltrans requests \$2000 bond for encroachment permit. Request bond from insurance carrier.
- 7/14/89 Receive City of Oakland Excavation Permit.
- 7/18/89 Destroy MW-5 by drilling out well materials and grouting boring, and notify BAAQMD and Alameda County Health Department that excavation will begin on 7/20/89.
- 7/19/89 Armour Petroleum Service and Equipment Corporation pumps product from wells MW-2 through MW-4 and MW-8. A total of 7 gallons of product pumped.
- 7/20/89 Begin excavation on southern edge of tank pit with L & L Construction operating backhoe. Bulk of contamination between depths of 4 and 10 feet (water level at about 10 feet below grade). Soil is sandy clay with PID readings of 100 to 200 ppm and noticeable product odor; upper 4 feet is black, lower 6 feet blue-gray to blue. A concrete structure that appears to be an old pump island uncovered just southeast of MW-5 location. Piping containing an oily substance uncovered that extends from the pump island

toward the street at a depth of about 4 feet. An area of debris (bricks, lumber, etc.) found in southeast part of site; this material contains high PID readings (> 1000 ppm) and is excavated to the extent possible. Exploratory trenches dug to the west and northwest of the tank pit to determine if contamination diminishes. Uniform PID readings around 100 ppm found in soil between 5 and 10 feet deep along length of trenches, although product discoloration appears to diminish towards the end of trench A. Noticeable product odor in shallow soil smells more like diesel than gasoline on west side of pit. Samples collected from end of trench 1: TPHg concentration 61 ppm at 9 feet, TPH as diesel nondetectable at 5 feet.

- 7/26/89 Excavation terminated because of lack of space to stockpile excavated soil. Soil excavated as far as is feasible in the south and east directions (because of lack of space to maneuver backhoe in south and east part of site).
- 7/27/89 Soil samples collected from edges of pit and from stockpiled soil to be analyzed for gasoline hydrocarbons.
- 8/3/89 Receive results of stockpiled soil: total petroleum hydrocarbons as gasoline (TPHg) concentrations range from 63 to 330 ppm. Notify BAAQMD and Alameda Co. Health Dept. of intent to aerate soil. Caltrans representative says he has not received bond; another copy of bond requested from insurance carrier.
- 8/4/89 Spread 50 cubic yards of soil with an average concentration of 110 ppm TPHg to aerate onsite.
- 8/9/89 Aerating soil checked with PID. Vapor concentrations (10 to 35 ppm) and noticeable product odor have not diminished significantly. Sampled aerating soil for diesel hydrocarbons.
- 8/11/89 Armour Petroleum pumps product from four site wells. A total of 20 gallons of product pumped.
- 8/20/89 Laboratory results of aerating soil: 900 ppm TPH as diesel. Re-run soil sample from pit for diesel: 4000 ppm TPH as diesel.
- 9/5/89 Resample stockpiled soil for TPH as diesel analyses. Monitor site wells. Sampled aerating soil for diesel and gasoline analyses..
- Status: Awaiting results of 9/5/89 sampling; expect results on 9/20/89 p.m. Site visit scheduled for 9/21/89. Wells will be monitored, site condition will be checked. Status report describing ground-water monitoring, product recovery, excavation, soil sampling, in preparation. Expect decision from Caltrans regarding encroachment permit this week.

TABLE 1
CUMULATIVE GROUNDWATER MONITORING AND SAMPLING DATA
 Exxon Service Station 7-3006
 720 High Street, Oakland, California
 (Page 27 of 27)

Notes:

SUBJ	= Results of subjective evaluation, liquid-phase hydrocarbon thickness (HT) in feet	NA	= Not Analyzed
LPH	= Liquid-phase hydrocarbons present, thickness not measured	<	= Less than the indicated detection limit shown by the laboratory
NLPH	= No liquid phase hydrocarbons present in well	#	= Well monitored but not sampled
TOC	= Elevation of top of well casing; relative to mean sea level	1	= Chloromethane
DTW	= Depth to water	2	= Analyzed for Stoddard Solvent using EPA method 5030/8015.
Elev.	= Elevation of groundwater. If liquid-phase hydrocarbons present, elevation adjusted using TOC - [DTW - (PT x 0.8)].	3	= Additional Analysis on MW-1 - Fecal Coliform Most Probable Number (MPN)/100 ml.
[]	= amount recovered	4	= VOCs Detected using EPA Method 624 - 16,000 ppb Benzene, 480 ppb Toluene, 4,500 ppb Ethylbenzene, 9,900 ppb total Xylenes.
gal.	= gallons		VOCs Detected using EPA Method 625 - 1,800 ppb Naphthalene, 600 ppb 2-Methylnaphthalene, Bis(2-ethylhexyl) phthalate
c.	= cups		= Stoddard Solution detected in the sample at approximately 320 ppb
TPHg	= Total petroleum hydrocarbons as gasoline analyzed using modified EPA method 5030/8015.		= Analyzed for Stoddard Solvent using modified EPA method 5030/8015. Sample chromatogram was not representative of a Stoddard Solvent pattern. Pattern was representative of the heavier hydrocarbons found in a gasoline pattern.
BTEX	= Benzene, Toluene, Ethylbenzene, and total Xylenes analyzed using modified EPA method 5030/8020.	5	= Department of Health Services, State of California, October 1990
TPHd	= Total petroleum hydrocarbons as diesel analyzed using EPA method 3510/8015.	6	= Sample pattern does not match the diesel standard pattern
VOCs	= Volatile organic compounds analyzed using EPA method 624.		= A peak eluting earlier than benzene and suspected to be methyl tert-butyl ether was present
TOG	= Total oil and grease analyzed using Standard Method 5520.		
*	= Analyzed using EPA method 624 (volatile organic compounds).	DHS	
**	= See Table 3 for additional Analysis	7	
NR	= No liquid-phase hydrocarbons removed from well	8	
NM	= Not Measured		
ND	= Not Detectable

ATTACHMENT E

FIELD INVESTIGATION PROTOCOLS

FIELD PROTOCOL

Site Safety Plan

Field work will be performed by ERI personnel in accordance with a Site Safety Plan developed for the site. This plan describes the basic safety requirements for the subsurface investigation and the drilling of soil borings at the work site. The Site Safety Plan is applicable to personnel and subcontractors of ERI. Personnel at the site are informed of the contents of the Site Safety Plan before work begins. A copy of the Site Safety Plan is kept at the work site and is available for reference by appropriate parties during the work. The ERI geologist will act as the Site Safety Officer.

Advancement of Direct-Push Soil Borings

Prior to the advancement of the soil borings, ERI will acquire necessary permits from the appropriate agencies. ERI will also contact Underground Service Alert (USA) and a private underground utility locator (per ExxonMobil protocol) before drilling to help locate public utility lines at the site. ERI will clear the proposed location to a depth of approximately 4 or 8 feet (depending on the location), before drilling to reduce the risk of damaging underground structures.

The borings will be advanced using direct-push technology. Samples will be continuously collected. The earth materials in the boring will be identified using visual and manual methods, and classified as drilling progresses using the Unified Soil Classification System. Equipment will be steam-cleaned before use to minimize the possibility of crosshole contamination. The rinsate will be containerized and stored on site. ERI will coordinate with ExxonMobil for appropriate disposal of the rinsate.

Soil samples will be monitored with a photo-ionization detector (PID), which measures hydrocarbon concentrations in the ambient air or headspace above the soil sample. Field instruments such as the PID are useful for indicating relative levels of hydrocarbon vapors, but do not detect concentrations of hydrocarbons with the same precision as laboratory analyses. Groundwater samples will be collected from each of the borings.

Select soil samples will be sealed promptly with Teflon® tape and plastic caps. The samples will be labeled and placed in iced storage for transport to the laboratory. Chain-of-Custody records will be initiated by the geologist in the field, updated throughout handling all soil and groundwater samples, and sent with the samples to the laboratory. Copies of these records will be in the final report.

Cuttings generated during drilling will be containerized and stored at the site. ERI will coordinate with ExxonMobil for the soil to be removed to an appropriate disposal facility

Advancement of Cone Penetrometer Test Borings

Prior to the advancement of the CPT borings, ERI will acquire necessary permits from the appropriate agencies. ERI will also contact Underground Service Alert (USA) and a private underground utility locator (per ExxonMobil protocol) before drilling to help locate public utility lines at the site. ERI will clear the proposed location to a depth of approximately 4 or 8 feet (depending on the location), before drilling to reduce the risk of damaging underground structures.

The borings will be advanced using CPT technology as described in Gregg Drilling, Inc report in Attachment F. After completion of the CPT boring, the steel pipe assembly and piezocene are removed from the borehole. The hollow steel pipe without the instrument tip and a plastic tremie pipe are advanced to the total depth of the borehole and then the borehole is then grouted from the bottom up with neat cement grout as the hollow steel pipe is removed.

Equipment will be steam-cleaned before use to minimize the possibility of crosshole contamination. The rinsate will be containerized and stored on site. ERI will coordinate with ExxonMobil for appropriate disposal of the rinsate.

The CPT log is used to select groundwater sampling depths. A second borehole is advanced adjacent to the CPT hole using direct-push and Hydropunch® sampling technology to collect depth discrete groundwater samples.

Hydropunch® Sampling Technology

The Hydropunch® sampler provides a method for collecting groundwater samples using a specially designed sample tool to provide a hydraulic connection with the water table. Both groundwater and separate-phase hydrocarbons may be sampled using a Hydropunch® sampler. To sample groundwater, the sample tool is pushed to the selected depth beneath the water table, then withdrawn to expose an inlet screen. The screened interval of the sampler is approximately 3 to 5 feet. Groundwater flows through the inlet screen and fills the body of the sampler. A water sample is then collected from the body of the sampler, and subsequently examined for air bubbles to avoid headspace, which would allow volatilization to occur. The samples are promptly transported in iced storage in a thermally-insulated ice chest, accompanied by a Chain-of-Custody record, to a California state-certified laboratory.

ATTACHMENT F

CPT LOGS

Cone Penetration Testing Procedure (CPT)

Gregg In Situ, Inc. carries out all Cone Penetration Tests (CPT) using an integrated electronic cone system, *Figure CPT*. The soundings were conducted using a 20 ton capacity cone with a tip area of 15 cm^2 and a friction sleeve area of 225 cm^2 . The cone is designed with an equal end area friction sleeve and a tip end area ratio of 0.85.

The cone takes measurements of cone bearing (q_c), sleeve friction (f_s) and dynamic pore water pressure (u_2) at 5-cm intervals during penetration to provide a nearly continuous hydrogeologic log. CPT data reduction and interpretation is performed in real time facilitating on-site decision making. The above mentioned parameters are stored on disk for further analysis and reference. All CPT soundings are performed in accordance with revised (2002) ASTM standards (D 5778-95).

The cone also contains a porous filter element located directly behind the cone tip (u_2), *Figure CPT*. It consists of porous plastic and is 5.0mm thick. The filter element is used to obtain dynamic pore pressure as the cone is advanced as well as Pore Pressure Dissipation Tests (PPDT's) during appropriate pauses in penetration. It should be noted that prior to penetration, the element is fully saturated with silicon oil under vacuum pressure to ensure accurate and fast dissipation.

When the soundings are complete, the test holes are grouted using a Gregg In Situ support rig. The grouting procedure consists of pushing a hollow CPT rod with a "knock out" plug to the termination depth of the test hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole. Disruption or further contamination to the site is therefore minimized.

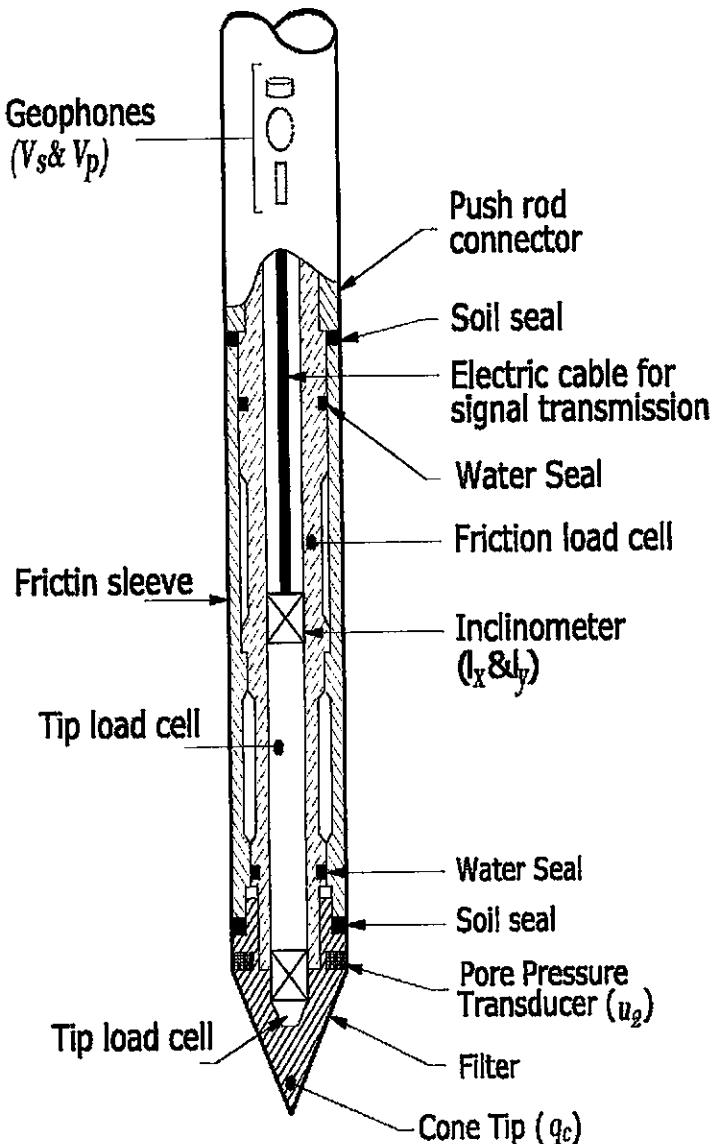

Figure CPT

Cone Penetration Test Data & Interpretation

Soil behavior type and stratigraphic interpretation is based on relationships between cone bearing (q_c), sleeve friction (f_s), and pore water pressure (u_2). The friction ratio (R_f) is a calculated parameter defined by $100f_s/q_c$ and is used to infer soil behavior type. Generally:

Cohesive soils (clays)

- High friction ratio (R_f) due to small cone bearing (q_c)
- Generate large excess pore water pressures (u_2)

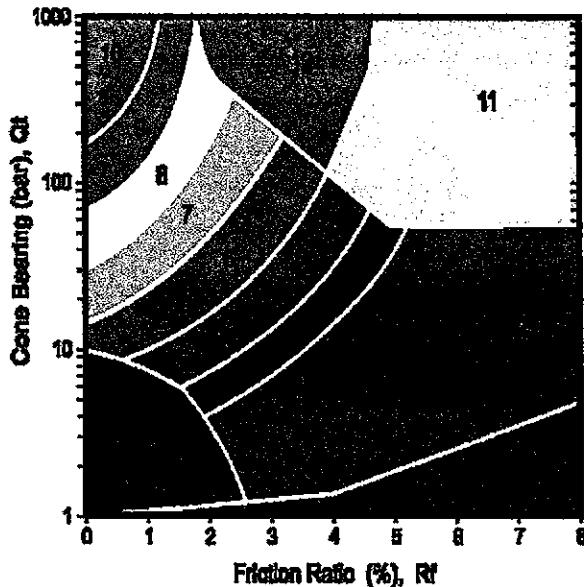

Cohesionless soils (sands)

- Low friction ratio (R_f) due to large cone bearing (q_c)
- Generate very little excess pore water pressures (u_2)

A complete set of baseline readings are taken prior to and at the completion of each sounding to determine temperature shifts and any zero load offsets. Corrections for temperature shifts and zero load offsets can be extremely important, especially when the recorded loads are relatively small. In sandy soils, however, these corrections are generally negligible.

The cone penetration test data collected from your site is presented in graphical form in Appendix CPT. The data includes CPT logs of measured soil parameters, computer calculations of interpreted soil behavior types (SBT), and additional geotechnical parameters. A summary of locations and depths is available in Table 1. Note that all penetration depths referenced in the data are with respect to the existing ground surface.

Soil interpretation for this project was conducted using recent correlations developed by Robertson et al, 1990, *Figure SBT*. Note that it is not always possible to clearly identify a soil type based solely on q_c , f_s , and u_2 . In these situations, experience, judgment, and an assessment of the pore pressure dissipation data should be used to infer the soil behavior type.

ZONE	Qt/N	SBT
1	2	Sensitive, fine grained
2	1	Organic materials
3	1	Clay
4	1.5	Silty clay to clay
5	2	Clayey silt to silty clay
6	2.5	Sandy silt to clayey silt
7	3	Silty sand to sandy silt
8	4	Sand to silty sand
9	5	Sand
10	6	Gravely sand to sand
11	1	Very stiff fine grained*
12	2	Sand to clayey sand*

This report includes the analytical certificates of analysis for all samples listed below. These samples relate to your project identified below:

Project Name: EXXONMOBIL 7-3006
Project Number: 201014X.
Laboratory Project Number: 413001.

An executed copy of the chain of custody, the project quality control data, and the sample receipt form are also included as an addendum to this report. Any QC recoveries outside laboratory control limits are flagged individually with an #. Sample specific comments and quality control statements are included in the Laboratory notes section of the analytical report for each sample report. If you have any questions relating to this analytical report, please contact your Laboratory Project Manager at 1-800-765-0980. Any opinions, if expressed, are outside the scope of the Laboratory's accreditation.

ANALYTICAL REPORT

Laboratory Number: 05-A53898
Sample ID: S-10.5-DP4
Project: 201014X
Page 2

Surrogate	% Recovery	Target Range
UST surr-Trifluorotoluene	100.	56. - 145.
TPH Hi Surr., o-Terphenyl	68.	35. - 135.
VOA Surr, 1,2-DCAd4	91.	72. - 125.
VOA Surr Toluene-d8	127. #	80. - 124.
VOA Surr, 4-BFB	111.	25. - 165.
VOA Surr, DBEM	97.	73. - 124.

LABORATORY COMMENTS:

ND = Not detected at the report limit.

B = Analyte was detected in the method blank.

J = Estimated Value below Report Limit.

E = Estimated Value above the calibration limit of the instrument.

= Recovery outside Laboratory historical or method prescribed limits.

** = NELAC E87358 Certified Analyte

All results reported on a wet weight basis.

Volatile sample was received in a metal tube.

VOA8260 surrogates outside QC range due to sample matrix.

TPH-Diesel result was not consistent with diesel fuel.

COOLER RECEIPT FORM

BC#

Client Name : ERI

Cooler Received/Opened On: 4/16/05 Accessioned By: James D. Jacobs

Log-in Personnel Signature

1. Temperature of Cooler when triaged: 1,2 Degrees Celsius
2. Were custody seals on outside of cooler? YES...NO...NA
a. If yes, how many and where: 1 Front
3. Were custody seals on containers? NO...YES...NA
4. Were the seals intact, signed, and dated correctly? YES...NO...NA
5. Were custody papers inside cooler? YES...NO...NA
6. Were custody papers properly filled out (ink, signed, etc)? YES...NO...NA
7. Did you sign the custody papers in the appropriate place? YES...NO...NA
8. What kind of packing material used? Bubblewrap Peanuts Vermiculite Other None
9. Cooling process: Ice Ice-pack Ice (direct contact) Dry ice Other None
10. Did all containers arrive in good condition (unbroken)? YES...NO...NA
11. Were all container labels complete (#, date, signed, pres., etc)? YES...NO...NA
12. Did all container labels and tags agree with custody papers? YES...NO...NA
13. Were correct containers used for the analysis requested? YES...NO...NA
14. a. Were VOA vials received? YES... NO...NA
b. Was there any observable head space present in any VOA vial? NO... YES...NA
15. Was sufficient amount of sample sent in each container? YES...NO...NA
16. Were correct preservatives used? YES...NO...NA

If not, record standard ID of preservative used here _____

17. Was residual chlorine present? NO... YES...NA

This report includes the analytical certificates of analysis for all samples listed below. These samples relate to your project identified below:

Project Name: EXXONMOBIL 7-3006
Project Number: 201014X.
Laboratory Project Number: 412355.

An executed copy of the chain of custody, the project quality control data, and the sample receipt form are also included as an addendum to this report. Any QC recoveries outside laboratory control limits are flagged individually with an #. Sample specific comments and quality control statements are included in the Laboratory notes section of the analytical report for each sample report. If you have any questions relating to this analytical report, please contact your Laboratory Project Manager at 1-800-765-0980. Any opinions, if expressed, are outside the scope of the Laboratory's accreditation.

VOA Surr, DBFM	101.	73. - 124.

LABORATORY COMMENTS:

ND = Not detected at the report limit.

B = Analyte was detected in the method blank.

J = Estimated Value below Report Limit.

E = Estimated Value above the calibration limit of the instrument.

= Recovery outside Laboratory historical or method prescribed limits.

** = NELAC E87358 Certified Analyte

All results reported on a wet weight basis.

8260 surrogates outside QC range due to sample matrix.

Volatile sample was received in a metal tube.

The TRPH-Diesel surrogate was diluted out due to sample matrix.

End of Sample Report.

COOLER RECEIPT FORM

BC#

Client Name : ERI

Cooler Received/Opened On: 4/12/05 Accessed By: James D. Jacobs

Log-in Personnel Signature

1. Temperature of Cooler when triaged: -0.6 Degrees Celsius
2. Were custody seals on outside of cooler?..... YES...NO...NA
- a. If yes, how many and where: 1 Front
3. Were custody seals on containers?..... NO...YES...NA
4. Were the seals intact, signed, and dated correctly?..... YES...NO...NA
5. Were custody papers inside cooler?..... YES...NO...NA
6. Were custody papers properly filled out (ink, signed, etc)?..... YES...NO...NA
7. Did you sign the custody papers in the appropriate place?..... YES...NO...NA
8. What kind of packing material used? Bubblewrap Peanuts Vermiculite Other None Ziploc baggies
9. Cooling process: Ice Ice-pack Ice (direct contact) Dry ice Other None
10. Did all containers arrive in good condition (unbroken)?..... YES...NO...NA
11. Were all container labels complete (#, date, signed, pres., etc)?..... YES...NO...NA
12. Did all container labels and tags agree with custody papers?..... YES...NO...NA
13. Were correct containers used for the analysis requested?..... YES...NO...NA
14. a. Were VOA vials received?..... YES...NO...NA
- b. Was there any observable head space present in any VOA vial?..... NO...YES...NA
15. Was sufficient amount of sample sent in each container?..... YES...NO...NA
16. Were correct preservatives used?..... YES...NO...NA

If not, record standard ID of preservative used here _____

17. Was residual chlorine present?..... NO...YES...NA
18. Indicate the Airbill Tracking Number (last 4 digits for Fedex only) and Name of Courier below:

COC incorrect. Sample name is S-6-DP6. Per Jim Chappell 4-12-05 @ 15:21.

From: Leah Klingensmith

Sent: Tuesday, April 12, 2005 2:01 PM

To: 'Jim F. Chappell'

Subject: RE: 7-3006

Hey Jim,

Also on this, EDB and 1,2-DCA are usually part of the 7 oxy list. Should only the 7 compounds be reported by 8260B or are there others?

Leah

-----Original Message-----

To: 'Jim F. Chappell'

Subject: 7-3006

Hi Jim,

The lab received the samples for the above site. On the third page of the COC, a sample is listed as S-8-DP6 on the 6th at 1450. Containers were not submitted with this label but some were submitted for S-6-DP6 from the 6th at 1415. Is the sample mislabeled or the COC incorrect?

We did not receive S-8-DP6 sampled on 4/6/05 at 1450 as per COC, but we did receive S-6-DP6 sampled on 4/6/05 at 1415.

This report includes the analytical certificates of analysis for all samples listed below. These samples relate to your project identified below:

Project Name: EXXONMOBIL 7-3006
Project Number: 201014X.
Laboratory Project Number: 412896.

An executed copy of the chain of custody, the project quality control data, and the sample receipt form are also included as an addendum to this report. Any QC recoveries outside laboratory control limits are flagged individually with an #. Sample specific comments and quality control statements are included in the Laboratory notes section of the analytical report for each sample report. If you have any questions relating to this analytical report, please contact your Laboratory Project Manager at 1-800-765-0980. Any opinions, if expressed, are outside the scope of the Laboratory's accreditation.

COOLER RECEIPT FORM

BC#

412895

Client Name : ERICooler Received/Opened On: 4/15/05 Accessioned By: James D. Jacobs
Log-in Personnel Signature

1. Temperature of Cooler when triaged: 3.8 Degrees Celsius
2. Were custody seals on outside of cooler?..... YES... NO... NA
a. If yes, how many and where: 1 Front
3. Were custody seals on containers?..... NO... YES... NA
4. Were the seals intact, signed, and dated correctly?..... YES... NO... NA
5. Were custody papers inside cooler?..... YES... NO... NA
6. Were custody papers properly filled out (ink, signed, etc)?..... YES... NO... NA
7. Did you sign the custody papers in the appropriate place?..... YES... NO... NA
8. What kind of packing material used? Bubblewrap Peanuts Vermiculite Other None
9. Cooling process: Ice Ice-pack Ice (direct contact) Dry ice Other None
10. Did all containers arrive in good condition (unbroken)?..... YES... NO... NA
11. Were all container labels complete (#, date, signed, pres., etc)?..... YES... NO... NA
12. Did all container labels and tags agree with custody papers?..... YES... NO... NA
13. Were correct containers used for the analysis requested?..... YES... NO... NA
14. a. Were VOA vials received?..... YES... NO... NA
b. Was there any observable head space present in any VOA vial?..... NO... YES... NA
15. Was sufficient amount of sample sent in each container?..... YES... NO... NA
16. Were correct preservatives used?..... YES... NO... NA

If not, record standard ID of preservative used here _____

17. Was residual chlorine present?..... NO... YES... NA

18. Indicate the Airbill Tracking Number (last 4 digits for Fedex only) and Name of Courier below:

8740. The airbill on one of the coolers was missing upon receipt at lab.Fed-Ex

This report includes the analytical certificates of analysis for all samples listed below. These samples relate to your project identified below:

Project Name: EXXONMOBIL 7-3006
Project Number: 201014X.
Laboratory Project Number: 413084.

An executed copy of the chain of custody, the project quality control data, and the sample receipt form are also included as an addendum to this report. Any QC recoveries outside laboratory control limits are flagged individually with an #. Sample specific comments and quality control statements are included in the Laboratory notes section of the analytical report for each sample report. If you have any questions relating to this analytical report, please contact your Laboratory Project Manager at 1-800-765-0980. Any opinions, if expressed, are outside the scope of the Laboratory's accreditation.

COOLER RECEIPT FORM

BC#

413084

Client Name : ERI

Cooler Received/Opened On: 4/16/05 Accessioned By: James D. Jacobs

Log-in Personnel Signature

1. Temperature of Cooler when triaged: 0.2 Degrees Celsius
2. Were custody seals on outside of cooler? YES... NO... NA
a. If yes, how many and where: 1 Front
3. Were custody seals on containers? NO... YES... NA
4. Were the seals intact, signed, and dated correctly? YES... NO... NA
5. Were custody papers inside cooler? YES... NO... NA
6. Were custody papers properly filled out (ink, signed, etc)? YES... NO... NA
7. Did you sign the custody papers in the appropriate place? YES... NO... NA
8. What kind of packing material used? Bubblewrap Peanuts Vermiculite Other None
9. Cooling process: Ice Ice-pack Ice (direct contact) Dry ice Other None
10. Did all containers arrive in good condition (unbroken)? YES... NO... NA
11. Were all container labels complete (#, date, signed, pres., etc)? YES... NO... NA
12. Did all container labels and tags agree with custody papers? YES... NO... NA
13. Were correct containers used for the analysis requested? YES... NO... NA
14. a. Were VOA vials received? YES... NO... NA
b. Was there any observable head space present in any VOA vial? NO... YES... NA
15. Was sufficient amount of sample sent in each container? YES... NO... NA
16. Were correct preservatives used? YES... NO... NA

If not, record standard ID of preservative used here _____

17. Was residual chlorine present? NO... YES... NA
18. Indicate the Airbill Tracking Number (last 4 digits for Fedex only) and Name of Courier below:

BASIS OF COORDINATES:

COORDINATES ARE CALIFORNIA STATE PLANE ZONE 3 COORDINATES FROM GPS OBSERVATIONS USING UNIVERSITY OF CALIFORNIA BAY AREA DEFORMATION CORS STATION OBSERVATION FILES AND BASED ON THE CALIFORNIA SPATIAL REFERENCE CENTER DATUM, REFERENCE EPOCH 2000.35.

COORDINATE DATUM IS NAD 83(1986)

DATUM ELLIPSOID IS GRS80

REFERENCE GEODETIC IS NGS89

CORS STATIONS USED WERE DIAB AND PBL1.

ELEVATIONS ARE BASED ON CITY OF OAKLAND BENCHMARK #12. MONUMENT IN BOX AT WALKWAY. ELEVATION=16.76'.
