Re: Former Chevron Service Station No. 91026
3701 Broadway
Oakland, CA

I have reviewed the attached report entitled *Conceptual Site Model and Low-Threat Case Closure Request*.

I agree with the conclusions and recommendations presented in the referenced report. The information in this report is accurate to the best of my knowledge and all local Agency/Regional Board guidelines have been followed. This report was prepared by Conestoga-Rovers & Associates, upon whose assistance and advice I have relied.

This letter is submitted pursuant to the requirements of California Water Code Section 13267(b)(1) and the regulating implementation entitled Appendix A pertaining thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge.

Sincerely,

Brian A. Waite

LIST OF APPENDICES

1.0 INTRODUCTION

Conestoga-Rovers & Associates (CRA) is submitting this *Conceptual Site Model and Low-Threat Case Closure Request* on behalf of Chevron Environmental Management Company (Chevron) for Chevron Service Station No. 91026 located at 3701 Broadway, Oakland, California (Figure 1). The site meets general and media-specific criteria and should be closed under the *Low-Threat Underground Storage Tank Case Closure Policy* (LTCP). The LTCP was adopted in 2013 by the State Water Board to provide standard statewide closure criteria for low-threat underground storage tank (UST) sites that are subject to Chapter 6.7 of Division 20 of the Health and Safety Code and Chapter 16 of Division 3 of Title 23 of the California Code of Regulations. A Conceptual site model (CSM), an evaluation of the site conditions with respect to the LTCP case closure criteria, and conclusions and recommendations are presented herein.

2.0 SITE BACKROUND

2.1 SITE DESCRIPTION

The site is a former Chevron service station located on the northern corner of the intersection of Broadway and MacArthur Boulevard in Oakland, California (Figure 1). Based on aerial photographs and Sanborn Fire Insurance Maps, the site appears to have been an active service station prior to 1939. In 1988, the station was closed and all structures removed. The site was used for parking until 2006. In 2007, Kaiser Permanente (Kaiser) began construction of a medical office building that occupies a majority of the site (Figure 2). Prior to and during this construction, a majority of the hydrocarbon source mass was excavated from the site. Surrounding land use is a mixture of commercial, retail, and residential. Moswood Park is located to the south of the site, across MacArthur Boulevard.

2.2 PREVIOUS ENVIRONMENTAL WORK

A total of 14 groundwater monitoring wells have been installed to date. Due to site redevelopment, there are currently only four active monitoring wells (monitoring wells E, F, EA-1 and EA-2). In June 1991, wells B-6 and B-7 were destroyed, and well B was reconstructed, and in October 1992, wells E, F, and B-1 were also reconstructed. There is no information regarding onsite wells B-5 and C and it is assumed they have been destroyed. In order to facilitate remedial and redevelopment excavation, all remaining

onsite wells were destroyed by pressure grouting in June 2006. A summary of previous environmental investigation and remediation is included as Appendix A.

2.3 SITE GEOLOGY

The site is approximately 73 feet above mean sea level and surrounding topography is relatively flat. The site is located in the East Bay Plain Groundwater Basin on the eastern flank of the San Francisco Basin, a broad Franciscan Complex depression. The East Bay Plain is characterized by broad westward slopping alluvial fan deposits of Holocene to Pleistocene age. Franciscan Formation bedrock underlies the alluvial deposits at depth (150 to 180 fbg). Boring logs indicate the site is underlain primarily by clay interbedded with silt, clayey and silty sand and occasional gravel to the total depth explored of 37 fbg. Boring logs are included as Appendix B and geologic cross-sections are included as Figures 3 through 10.

2.4 SITE HYDROGEOLOGY

This site is located over the East Bay Plain Groundwater Basin. Groundwater in this basin is designated potentially beneficial for drinking water. Groundwater beneath the site flows toward the southwest and has historically ranged from approximately 8 to 21 fbg with an average depth of 15 fbg. Historical depth to groundwater measurements are presented in Table 1 and a groundwater flow direction rose diagram is included on Figure 2.

3.0 CONCEPTUAL SITE MODEL

3.1 HYDROCARBON SOURCE

According to Chevron records, a rusted fuel filter at the eastern pump island resulted in a subsurface release of gasoline in 1977. In 1988, Blaine Tech Services, Inc. (Blaine) removed the second generation USTs. No holes were observed in the fuel or used-oil USTs, but 1/8-inch of light non-aqueous phase liquid (LNAPL) was observed on groundwater in the gasoline/used-oil UST pit.

3.2 HYDROCARBON DISTRIBUTION

Primary constituents of potential concern (COPC) beneath the site are total petroleum hydrocarbons as gasoline (TPHg) and benzene. Other COPCs are toluene, ethylbenzene, and xylenes. No methyl tertiary butyl ether (MTBE) is detected in soil or groundwater and therefore is not a COPC. A discussion of hydrocarbon distribution is presented below.

3.2.1 LNAPL

LNAPL was first observed in monitoring wells in 1982 and was extracted between 1983 and 1987. Over 200 gallons of LNAPL/water mixture were removed from wells during this period. LNAPL removal resumed between June 1993 and March 1995, and an additional 32 gallons of LNAPL was removed from wells B, B-2 and B-3. During station removal in 1988, a total of approximately 3,500 gallons of LNAPL and groundwater were removed from the excavation. Product skimmers were installed in wells B and B-2 in 2001, and were maintained monthly by Gettler-Ryan until 2004. No report was issued documenting removal of the skimmers or the amount of groundwater and hydrocarbons removed. LNAPL was detected in well B until it was destroyed in 2006. This location was subsequently excavated.

3.2.2 SOIL

Residual maximum analyte concentrations detected in soil include:

- Total oil and grease (TOG) at 14,000 mg/kg in sample WOM at 10 fbg (sample collected in April 1988)
- Total petroleum hydrocarbons as motor oil (TPHmo) at 2,900 mg/kg in sample A1-17 at 15 fbg (sample collected in June 2007)
- Total petroleum hydrocarbons as diesel (TPHd) at 4,300 mg/kg in sample WOM at 10 fbg (sample collected in April 1988)
- Total petroleum hydrocarbons as gasoline (TPHg) at 7,900 mg/kg in sample SB37 at 10 fbg (sample collected in January 2006)
- Benzene at 3.1 mg/kg in sample A1-15 at 15 fbg (sample collected in June 2007)
- Toluene at 99 mg/kg in sample A1-8 at 15 fbg (sample collected in June 2007)
- Ethylbenzene at 49 mg/kg in sample A1-8 at 15 fbg (sample collected in June 2007)
- Total Xylenes at 277 mg/kg in sample A1-8 at 15 fbg (sample collected in June 2007)

- Naphthalene at 14 mg/kg in sample SB37 at 10 fbg (sample collected in January 2006)
- Chromium at 68 mg/kg in sample SB15 at 10 fbg (sample collected in January 2006)
- Cadmium at 0.65 mg/kg in sample SB15 at 10 fbg (sample collected in January 2006)
- Lead at 29 mg/kg in sample A1-17 at 15 fbg
- Nickel at 180 mg/kg in sample SB15 at 10 fbg (sample collected in January 2006)
- Zinc at 71 mg/kg in sample A1-11 at 15 fbg (sample collected in June 2007)

No MTBE, tert-butyl alcohol (TBA), 1,2-dibromoethane (EDB) or 1,2-dichloroethane (EDC) were detected. No polycyclic aromatic hydrocarbon (PAH) analyses were located.

In 1988 an unspecified amount of hydrocarbon impacted soil was overexacavated from the north and eastern sides of the UST pit, and in 2006 and 2007 a total of 7,800 cubic yards of soil were overexcavated from the site to depths ranging from 15 to 20 fbg. Residual TPHg and benzene are primarily between 15 and 20 fbg and adequately defined laterally (Figures 11 through 14). Cumulative soil data are listed in Table 2.

In terms of the LTCP criteria, residual TPHg between 0 and 10 fbg with a concentration of 100 mg/kg or greater was reported at two onsite location: SWE-3 (350 mg/kg @ 5 fbg), and SB37 (7,900 mg/kg @ 10 fbg). No benzene or ethylbenzene concentrations in soil exceeded commercial/industrial LTCP criteria. This is discussed further in Section 4.2.3.

3.2.3 GROUNDWATER

Groundwater has been monitored for 24 years; historically by a total of 14 wells and currently by four offsite wells. The other 10 wells were destroyed for site redevelopment and remedial excavations. Recent groundwater data is summarized below in Table A and historic groundwater data is presented in Table 1. Monitoring well construction details are included in Table 3.

There are three current downgradient monitoring wells (E, F, and EA-1) located in the median of MacArthur Boulevard (Figure 7). Wells E and F were originally installed in 1982 with screen intervals of 5 to 20 fbg, similar to the former onsite wells. In 1992, due to insufficient groundwater, offsite wells E and F were deepened to their current screen intervals of 20 to 35 fbg and 15 to 30 fbg, respectively. Onsite well B-1 was also

deepened. After the wells were deepened, groundwater rose to approximately 12 fbg in well E and approximately 15 fbg in well F, indicating the shallow water-bearing zone is confined. Although the screens are submerged, they are screened appropriately to monitor the water-bearing zone through which groundwater is flowing

Distribution of Hydrocarbons in Groundwater

Current groundwater analytical results for TPHg, BTEX, and MTBE are summarized below in Table A.

TABLE A: GROUNDWATER ANALYTICAL DATA
February 20, 2013

Well ID	*TPHg (µg/L)*	*Benzene (µg/L)*	*Toluene (µg/L)*	*Ethylbenzene (µg/L)*	*Total Xylenes (µg/L)*	*MTBE (µg/L)*
ESLs	***100***	***1***	***40***	***30***	***20***	***5***
E	<50	<0.5	<0.5	<0.5	<0.5	<0.5
EA-1	<50	<0.5	<0.5	<0.5	<0.5	<0.5
EA-2	<50	<0.5	<0.5	<0.5	<0.5	<0.5
F	<50	<0.5	<0.5	<0.5	<0.5	<0.5

ESL *Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater*, Prepared by California Regional Water Quality Control Board San Francisco Bay Region, Interim Final - November 2007, (Revised May 2008), Table F-1a-Groundwater Screening Levels-Current or Potential Drinking Water Resource.

< Indicates constituent was not detected at or above laboratory reporting limit.

As shown in Table A, no dissolved-phase hydrocarbons are detected in offsite groundwater, indicating any residual dissolved hydrocarbons are limited onsite. Offsite well EA-2, located east (crossgradient) of the site historically contained dissolved hydrocarbons at maximum concentrations of 950 µg/L TPHg and 31 µg/L benzene; however, no hydrocarbons have been detected since 2003 indicating the dissolved plume is shrinking back toward the former source.

3.2.4 SOIL VAPOR

On January 8, 2004, Secor collected a soil vapor sample at approximately 20 fbg from Geoprobe™ boring SB2 located adjacent to the former gasoline USTs. Details of the sampling are described in Secor's February 10, 2004 *Phase II Environmental Site Assessment Report*. No benzene, toluene, ethylbenzene, xylenes, or naphthalene were detected. TPHg was detected at 98,000 micrograms per cubic meter ($\mu g/m^3$). The laboratory report for SB2 is included as Appendix C. No other vapor samples have been collected at the site; however, the majority of the hydrocarbon impacted soil has been removed from the site to depths ranging from 15 to 20 fbg.

3.3 HYDROCARBON SOURCE REMEDIATION

Primary Source Removal

The USTs that were the primary source were removed in 1988. The fuel UST pit excavation was extended to the north and east to remove visibly contaminated soil; however, no information is available regarding the amount of soil removed by the remedial excavation. Additional information is available in Blaine's June 13, 1988 *Cumulative Report*.

Secondary Source Removal

LNAPL was first observed in monitoring wells in 1982 and was extracted between 1983 and 1987. Over 200 gallons of LNAPL/water mixture were removed from the wells during this period. LNAPL removal resumed between June 1993 and March 1995, and an additional 32 gallons of LNAPL was removed from wells B, B-2 and B-3. During station removal in 1988, a total of approximately 3,500 gallons of LNAPL and groundwater were removed from the excavation. Product skimmers were installed in wells B and B-2 in 2001, and were maintained monthly by Gettler-Ryan, Inc. (Gettler-Ryan) until 2004. No report was issued to document removal of the skimmers or the amount of groundwater and hydrocarbons removed.

In 1992, a soil vapor extraction (SVE) pilot test was conducted; however data suggested that SVE would not be effective based on a relatively low extracted vapor flow rates. Additional information is available in Weiss Associates' (Weiss) April 7, 1992 *Soil Vapor Extraction Test Report*.

Excavations by Chevron and Kaiser occurred in 2006 and 2007. The Chevron excavation encompassed a 25-foot wide, 147-foot long and 20-foot deep strip along the southern property boundary. Approximately 2,800 cubic yards of hydrocarbon impacted soil

were removed from the excavation. The excavation was limited by proximity to the street and other adjacent structures. The Kaiser excavation encompassed an 80-foot wide, 125-foot long, and 15-foot deep excavation from the center to the northern property boundary. Approximately 5,000 cubic yards of hydrocarbon impacted soil were removed from the excavation. Additional information is available in Cambria Environmental Technology, Inc's (Cambria) January 24, 2007 *Site Investigation and Remedial Excavation Report* and Secor's June 11, 2008 *Soil Management Implementation Report.*

Between May 2007 and May 2008, Kaiser dewatered and discharged approximately 14,000,000 gallons of groundwater to accommodate the excavation of hydrocarbon impacted soil and to allow underground structures to be built on all properties on and between 3701 and 3799 Broadway. The groundwater was extracted by 35, 40, and 50 feet deep groundwater extraction wells evenly spaced around the perimeter of the construction areas. The water was treated, and discharged to the sanitary sewer under an East Bay Municipal Utility District (EBMUD) Publicly Owned Treatment Works (POTW) permit and a San Francisco Regional Water Quality Control Board (SFRWQCB) National Pollutant Discharge Elimination System (NPDES) General Permit. The dewatering is detailed in Stantec's June 11, 2007 *Soil Management Implementation Plan* and July 23, 2008 *Second Quarter 2008 Report Temporary Groundwater Dewatering System*, and April 23, 2009 letter to Alameda County Environmental Health Services (ACEHS).

These remedial excavations removed the most readily available fraction of the residual hydrocarbon source mass to the extent practicable.

3.4 SENSITIVE RECEPTORS AND EXPOSURE PATHWAYS

3.4.1 SENSITIVE RECEPTOR SURVEY

The site is occupied by a Kaiser medical building and is surrounded by commercial properties. The nearest residences are located approximately 300 feet west (crossgradient) and 350 feet northeast (upgradient).

The site is provided water by the EBMUD. According to Geotracker's Groundwater Ambient Monitoring and Assessment (GAMA) database, no water supply wells are located within 1,000 feet of the site. The nearest water supply well is over 3 miles from the site, on Alameda Island.

CRA also reviewed online mapping services to identify other potential receptors within a 1/4-mile radius, including schools, hospitals, daycare centres, and eldercare facilities. No schools, daycare centers, or eldercare facilities were identified in the search area. The nearest schools, daycare centers and eldercare facilities are all over 2,000 feet from the site. The nearest hospital is the Kaiser building located on the site. This building contains medical offices and an outpatient clinic and was built with a waterproofing membrane along the footprint and walls of the basement, inhibiting groundwater and potential vapor entry into the basement.[1]

The nearest surface water body is the 69-inch diameter, concrete reinforced Glen Echo Creek storm drain located approximately 60 feet west (crossgradient) of the site. In 1984 (when the dissolved plume was at its maximum extent), a gasoline fingerprinting assessment, confirmed the gasoline entering Lake Merritt through the storm drain was from the Rainbow Car Wash, not Chevron.[2] Glen Echo Creek is located approximately 1,000 feet east of the site and Lake Merritt is located over one mile south of the site (Figure 1).

3.4.2 PREFERENTIAL PATHWAYS

In 2009, CRA obtained city sanitary sewer and storm drain maps. The locations of the sanitary sewer, storm drain, water, and electrical lines beneath MacArthur Boulevard and Broadway are illustrated on Figure 2. A 12-inch diameter storm drain and a 24-inch diameter sanitary sewer are located beneath MacArthur Boulevard between the site and wells E, F, and EA-1. Both flow west toward the 69-inch storm drain located approximately 60 feet west of the site, which trends north-south (water flows south). According to the City of Oakland utility map, the bottom of the sewer line appears to be approximately 20 fbg and the bottom of the storm drains appear to be approximately 10 fbg. The electric line is approximately 2 fbg and the water line is approximately 5 fbg.

Based on the historical depth to groundwater range of 8 to 21 fbg, water lines and electric lines, which are typically between 2 and 5 fbg, are not acting as preferential pathway for dissolved hydrocarbon migration. Groundwater depth in wells B, B-1, and B-2, located along the southern property boundary, was always measured greater than 10 fbg; therefore it is unlikely the storm drain located in MacArthur Boulevard downgradient of the site, is acting as a preferential pathway for dissolved hydrocarbon migration. Although the sewer line is located within the groundwater table, it is 45 feet

1 Information obtained in a February 6, 2014 McCarthy Construction/CRA phone call.

2 Burlington Environmental, Inc July 1, 1991 *Well Deepening Work Plan*.

from the edge of the site, and is unlikely acting as a preferential pathway for dissolved hydrocarbon migration.

4.0 COMPARISON OF SITE CONDITIONS TO POLICY CRITERIA AND REQUEST FOR LOW THREAT CLOSURE

Discussion of site conditions with respect to LTCP criteria are provided in this section and in the check list provided in Appendix D.

4.1 GENERAL CRITERIA

4.1.1 THE UNAUTHORIZED RELEASE IS LOCATED WITHIN THE SERVICE AREA OF A PUBLIC WATER SYSTEM

The site is located in the City of Oakland, which obtains most of its water supply from EBMUD. Ninety percent of the water is sourced from reservoirs in the Sierra Nevada and the remaining water supply is sourced from protected local watersheds.[3]

4.1.2 THE UNAUTHORIZED RELEASE CONSISTS ONLY OF PETROLEUM

All unauthorized releases consisted of petroleum hydrocarbons generated from service station operations.

4.1.3 THE UNAUTHORIZED ('PRIMARY') RELEASE FROM THE UST SYSTEM HAS STOPPED

All station and fueling facilities were removed in 1988.

4.1.4 FREE PRODUCT HAS BEEN REMOVED TO THE MAXIMUM EXTENT PRACTICABLE

Over 200 gallons of LNAPL/water mixture were removed from monitoring wells between 1983 and 1995. During station removal in 1988, a total of approximately 3,500 gallons of LNAPL and groundwater were removed from the excavation. Between

[3] Water supply information for the City of Oakland is from EBMUD's 2011 *Annual Water Quality Report*.

2001 and 2004 skimmers removed an unknown amount of product from wells B and B-2. Excavations by Chevron and Kaiser that occurred from 2006 to 2007 removed approximately 7,800 cubic yards of hydrocarbon impacted soil. These remedial efforts removed the LNAPL to the maximum extent practicable.

4.1.5 A CONCEPTUAL SITE MODEL THAT ASSESSES THE NATURE, EXTENT, AND MOBILITY OF THE RELEASE HAS BEEN DEVELOPED

A conceptual site model is presented above.

4.1.6 SECONDARY SOURCE HAS BEEN REMOVED TO THE EXTENT PRACTICABLE

Remedial and redevelopment excavations in 2006 and 2007 removed approximately 7,800 cubic yards of hydrocarbon impacted soil, excavating the majority of the site. The remedial effort has removed the secondary petroleum hydrocarbon source in soil and groundwater to the extent practicable.

4.1.7 SOIL AND GROUNDWATER HAVE BEEN TESTED FOR MTBE AND RESULTS REPORTED IN ACCORDANCE WITH HEALTH AND SAFETY CODE SECTION 25296.15

Soil and groundwater have been tested for MTBE and the analytical results are presented in Table 1 (groundwater data) and Table 2 (soil data).

4.1.8 NUISANCE AS DEFINED BY WATER CODE SECTION 13050 DOES NOT EXIST AT THE SITE

Nuisance is defined as follows per Water Code Section 13050. All three of the following requirements must be met to cause nuisance:

- Injurious to health, offensive to senses, or an obstruction of free property use
- Affects at the same time an entire community or neighborhood
- Occurs during or as the result of treatment or disposal of wastes (i.e., petroleum release)

Nuisance does not exist at the site.

4.2 MEDIA-SPECFIC CRITERIA

4.2.1 GROUNDWATER

The LTCP has five classes that define a plume as "low threat". The site meets the LTCP criteria for Plume Class 5, specifically:

- The contaminant plume that exceeds water quality objectives is less than 100 feet long.
- Free product and residual hydrocarbon mass in soil has been removed to the maximum extent practicable via site-wide excavation.
- The nearest water supply well is over 1,000 feet from the dissolved plume boundary.
- The concrete reinforced Glen Echo Creek storm drain is located approximately 60 feet west (crossgradient) of the site. However, a gasoline fingerprinting assessment, confirmed the gasoline entering Lake Merritt through the storm drain was from the Rainbow Car Wash, not Chevron.[4]
- The site was recently redeveloped and is almost entirely covered with Kaiser's medical building. The site is expected to remain a medical building for the foreseeable future.

Therefore, site conditions meet LTCP criteria for groundwater.

4.2.2 VAPOR INTRUSION TO INDOOR AIR

It is unlikely that there is a risk of vapor intrusion to indoor air based on the following.

- The majority of the site was excavated to approximately 15-20 fbg.
- According to Kaiser's Permanente's McCarthy Construction Project Manager, the Kaiser building was built with a waterproofing membrane along the footprint and walls of the basement which prevents groundwater and potential vapors from entering into the basement.

[4] Burlington Environmental, Inc July 1, 1991 *Well Deepening Work Plan*.

4.2.3 DIRECT CONTACT AND OUTDOOR AIR EXPOSURE

The LTCP contains concentration criteria for benzene, ethylbenzene, naphthalene, and PAHs in soil between 0 and 5 fbg and 5 to 10 fbg that are defined as "low threat" for the direct contact and outdoor air pathway for various receptors. Because this site is a Kaiser building surrounded by commercial buildings, the LTCP criteria, only commercial/industrial and utility worker criteria are evaluated. The LTCP criteria and maximum concentrations for the depth ranges are listed below in Table B.

TABLE B: POLICY CRITERIA AND MAXIMUM SITE SOIL CONCENTRATIONS FOR DIRECT CONTACT/OUTDOOR AIR EXPOSURE

Location ID	Date	Depth (fbg)	Benzene	Ethylbenzene	Naphthalene	PAHs
*Commercial/ Industrial**	***0 to 5 fbg***		***8.2***	***89***	***45***	***0.68***
	Volatilization to outdoor air 5 to 10 fbg		***12***	***134***	***45***	***NA***
Utility Worker*	***0 to 10 fbg***		***14***	***314***	***219***	***4.5***
SWE-4	6/22/2006	10	0.18	0.008	NA	NS
SWE-3	6/21/2006	5	<0.062	0.22	NS	NS
SB37	1/19/2006	10	<6.3	31	14	NS

All concentrations displayed in milligrams per kilogram (mg/kg)

* Concentrations of Petroleum Constituents in Soil That Will Have No Significant Risk of Adversely Affecting Human Health – California State Water Resources Control Board *Low-Threat Underground Storage Tank Case Closure Policy*, Section 3: Direct Contact and Outdoor Air Exposure (August 2012)

fbg Feet Below Grade

NA Not Applicable

NS Not Sampled

PAHs Poly-aromatic hydrocarbons as benzo(a)pyrene toxicity equivalent

** No concentrations at or exceeding the BaPequivalent for 16 priority pollutant PAHs (Naphthalene; Acenaphthene; Acenaphthylene; Anthracene; Benzo(a)anthracene; Benzo(a)pyrene; Benzo(b)fluoranthene; Benzo(g,h,i)perylene; Benzo(k)fluoranthene; Chrysene; Dibenz(a,h)anthracene; Fluoranthene; Fluorene; Indeno(1,2,3-cd)pyrene; Phenanthrene; Pyrene)

No analyte concentrations exceed the commercial/industrial or utility worker values in the Table B. Therefore, the site-specific evaluation shows that site conditions meet the LTCP criteria for the direct contact and outdoor air pathways.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on our review, the site conditions meet all the general and media-specific criteria established in the LTCP, and therefore poses a low threat to human health, safety, and the environment, and satisfy the case-closure requirements of the Health and Safety

Code section 25296.10, and case closure is consistent with Resolution 92-49 that requires that cleanup goals be met within a reasonable time frame.

Because no analytes are detected in groundwater and because these wells are in streets where sampling personnel are at risk of serious injury or death while sampling, CRA recommends that groundwater monitoring be suspended until ACEHS reviews this closure request.

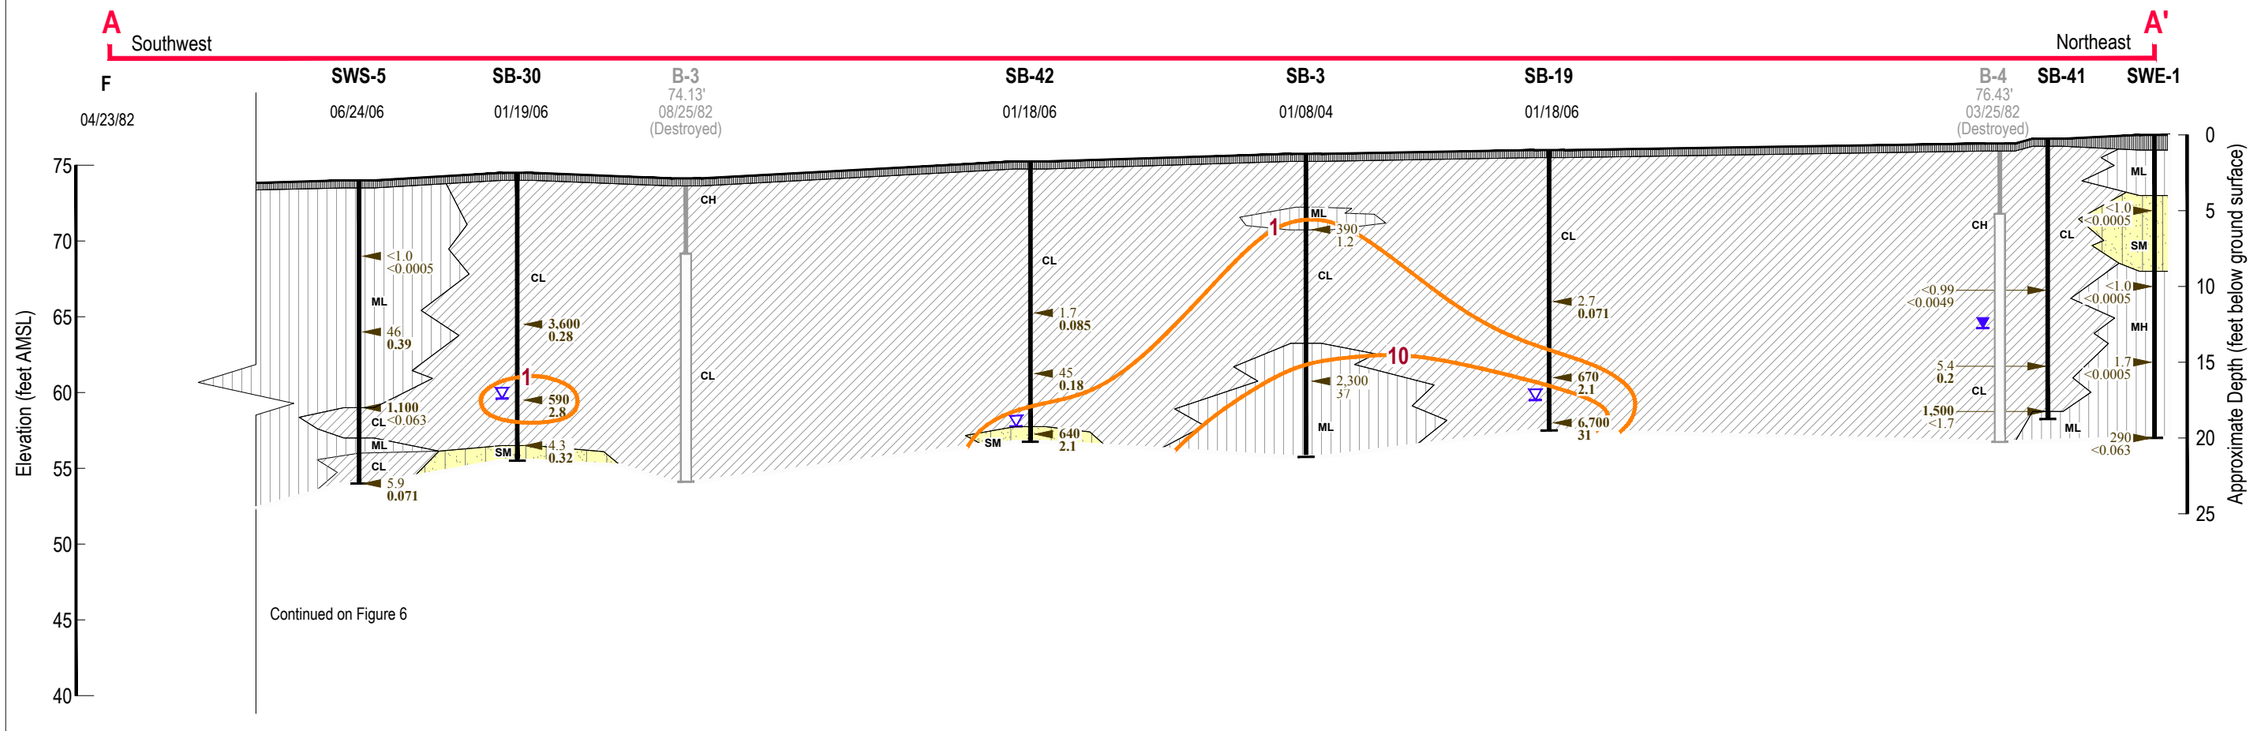
Figure 3

CROSS SECTION TRANSECT LINES
FORMER CHEVRON STATION 91026
3701 BROADWAY
Oakland, California



EXPLANATION

- SP - POORLY-GRADED SANDS, GRAVELLY SANDS, LITTLE OR NO FINES
- SM, SC - SILTY SANDS, SAND-SILT MIXTURES; CLAYEY SANDS, SAND-CLAY MIXTURES
- ML, MH - INORGANIC SILTS, VERY FINE SANDS, SILTY OR CLAYEY FINE SANDS,CLAYEY SILTS WITH SLIGHT PLASTICITY; HIGH PLASTICITY (MH)
- CL, CH - INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS; HIGH PLASTICITY (CH)
- 10 — Benzene concentration contour
- TPHg / Benzene — Hydrocarbon concentrations in soil, in milligrams per kilogram (mg/kg)

Well ID / Elev. — Well Designation; Top of Casing Elevation

- Groundwater Monitoring Well
- Well Screen Interval
- Bottom of boring
- Approximate sample location
- Approximate depth of Groundwater (03/03/09)
- First Encountered Groundwater

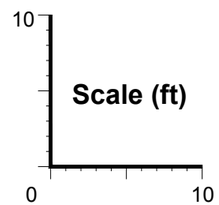


Figure 4

EXPLANATIONS:

Groundwater monitoring data and laboratory analytical results prior to August 28, 2000, were compiled from reports prepared by Blaine Tech Services, Inc.

TOC = Top of Casing
(ft.) = Feet
GWE = Groundwater Elevation
(msl) = Mean sea level
DTW = Depth to Water
LNAPLT = Light Non-Aqueous Phase Liquid Thickness
TPHg = Total Petroleum Hydrocarbons as Gasoline
B = Benzene
T = Toluene
E = Ethylbenzene
X = Xylenes
MTBE = Methyl Tertiary Butyl Ether
(µg/L) = Micrograms per liter
-- = Not Measured/Not Analyzed
ND = Not Detected
QA = Quality Assurance/Trip Blank

* TOC elevation referenced to msl.
** GWE was corrected for the presence of LNAPL; correction factor: [(TOC - DTW) + (LNAPLT x 0.80)].
1 Approximate thickness; equipment not functioning properly.
2 Chromatogram pattern indicated an unidentified hydrocarbon.
3 Laboratory report indicates gasoline C6-C12.
4 Laboratory report indicates sample was analyzed outside of the EPA recommended holding time.

TABLE 1

GROUNDWATER MONTIORING DATA AND ANALYTICAL RESULTS
FORMER CHEVRON STATION #9-1026
3701 BROADWAY
OAKLAND, CALIFORNIA

WELL ID/ DATE	*TOC* (ft.)*	*GWE (ft-amsl)*	*DTW (ft.)*	*LNAPLT (ft.)*	*LNAPL REMOVED (gallons)*	*TPHg (µg/L)*	*B (µg/L)*	*T (µg/L)*	*E (µg/L)*	*X (µg/L)*	*MTBE (µg/L)*

5 Product + water removed.
6 Laboratory report indicates unidentified hydrocarbons C6-C12.
7 Skimmer installed May of 2001.
8 Skimmer in well.
9 MTBE by EPA Method 8260.
10 Water removed from skimmer; no product.
11 Skimmer removed for repair.
12 BTEX and MTBE by EPA Method 8260.
13 0.5 ounces of product removed from well.
14 1.5 ounces of product removed from well.
15 2 ounces of product removed from well.
16 TOC was altered during well repairs; unable to determine an accurate GWE.

APPENDIX A

SUMMARY OF PREVIOUS ENVIRONMENTAL INVESTIGATION & REMEDIATION

SUMMARY OF PREVIOUS ENVIRONMENTAL INVESTIGATION AND REMEDIATION

Former Chevron Station 91026
3701 Broadway
Oakland, California

INVESTIGATION HISTORY

1977 Fuel Release

According to Chevron records, a fuel filter rusted at the eastern pump island resulting in a subsurface release of gasoline.

1982 Well Installation

In March 1982, K.H. Kleinfelder & Associates (Kleinfelder) installed onsite monitoring wells B-1 through B-4 to a total depth of 20 feet below grade (fbg). Groundwater was encountered at depths ranging from 17 to 19 fbg, but rose to within 10 to 12 fbg in the monitoring wells. The report concludes that confined aquifer conditions existed at the site. Additional information available in Kleinfelder's April 6, 1982 Groundwater Monitoring Well Installation Report.

1982 Site Evaluation

IT Enviroscience (IT) prepared Progress Report #1 on April 28, 1982 that detailed a site inspection and operator interview conducted to evaluate the major factors relating to groundwater impact at the site. During the evaluation they encountered existing wells which IT designated as monitoring wells B-5 through B-7. According to the station manager, George Bowers, the wells were installed in approximately 1979 (no reports have been located documenting well installation, which is not unusual for this era). According to the April 1982, Progress Report # 1, monitoring wells B-1 through B-4 were installed in March 1982 by Kleinfelder and wells A, B, C, E, and F were installed in April 1982 by IT. IT prepared a Progress Report #2 on May 18, 1982 that concluded gasoline impacted groundwater detected in onsite monitoring wells was associated with the Chevron service station. The report documents light non-aqueous phase liquids (LNAPL) encountered in the monitoring wells with a thickness of 0.08 to 5.7 feet. No LNAPL was observed in monitoring well B-4. This report concluded that offsite migration of hydrocarbons was unlikely due to low soil permeability. The report also concluded that utilities near the site were too shallow to act as potential preferential pathways. Additional information available in ITs' April 28, 1982 Progress Report #1 and May 18, 1982 Progress Report #2.

1984 Gasoline Fingerprinting

The United States Environmental Protection Agency notified several gasoline retailers that fuel was entering Lake Merritt through the Glen Echo Creek storm drain. Chevron conducted gas chromatography fingerprinting of samples from the storm drain, from the wells and dispensers on the Chevron site, and from Rainbow Carwash located directly north (upgradient) of the site. The results indicated that the fuel in the storm drain was of different composition from the hydrocarbons detected beneath the Chevron site, but was consistent with hydrocarbons detected at the Rainbow Carwash site. This information was referenced in the July 1, 1991 Well Deepening Work Plan by Burlington Environmental, Inc. No report is available.

1988 Tank Removal

Blaine Tech Services, Inc. (Blaine) removed the second generation underground storage tanks (USTs) from the site in April 1988. No holes were observed in the fuel or used-oil USTs, but 1/8-inch of LNAPL was observed on groundwater in the gasoline/used-oil UST pit. Approximately 2,800 gallons of LNAPL and groundwater were removed from the excavation prior to collection of compliance soil samples. The excavation was extended to the north and east to remove visibly contaminated soil. A product recovery UST in the northeastern part of the site was damaged during removal causing a release of hydrocarbons within the excavation. Approximately ¼-inch of LNAPL was measured on the groundwater surface. Approximately 700 gallons of LNAPL and groundwater were removed from the excavation prior to collection of compliance samples. No hydrocarbons were detected in soil samples collected from the sidewalls of this excavation. No information is available regarding the amount of soil removed by overexcavation from the UST pits. Additional information is available in Blaine's June 13, 1988 Cumulative Report.

1988 Well Installation

In April 1988, E.A. Engineering installed offsite monitoring wells EA-1 and EA-2. This information is mentioned in Groundwater Technology, Inc. (GTI)'s January 19, 1993 Environmental Assessment Report.

1991 Well Destructions

Weiss Associates (Weiss) submitted a well destruction report on June 25, 1991 for monitoring wells B-6 and B-7 (named wells 6 and 7 above). The wells were reportedly pressure grouted. Monitoring well B was reconstructed during this time by installing a 4-inch PVC casing within the existing 12-inch corrugated steel pipe and was screened between 15 and 35 fbg. The previous well B was constructed to 20 fbg. Additional information available in a letter from Weiss dated June 25, 1991.

1992 Groundwater Assessment

GTI destroyed monitoring wells E, F, and B-1 and re-installed the wells at deeper depths between 30 and 35.5 fbg. The groundwater assessment concluded that groundwater samples from onsite well B-4 had the highest TPHg concentrations. According to the report, the dissolved hydrocarbons appeared defined downgradient by wells F and EA-1. Additional information available in GTI's January 19, 1993 Environmental Assessment Report.

2004 Phase II Investigation

Secor International Inc. (Secor) prepared a Phase II Environmental Site Assessment Report (Phase II ESA) for Kaiser Foundation Health Plan (Kaiser). Secor advanced borings SB-1, SB-2, and SB-3 on the former Chevron site to a maximum depth of 24 fbg and determined that hydrocarbons in soil were primarily located from approximately 10 to 20 fbg in the vicinity of the former USTs and from approximately 2 to 20 fbg in the vicinity of the former fuel dispensers. Secor collected a soil vapor sample at approximately 20 fbg from boring SB2 located adjacent to the former gasoline USTs. No benzene, toluene, ethylbenzene, xylenes, or naphthalene were detected. TPHg was detected at 98,000 micrograms per cubic meter (µg/m3). Additional information available in SECOR's February 10, 2004 Phase II Environmental Site Assessment Report.

2006 Site Investigation and Excavation

Kaiser Permanente (Kaiser) proposed redeveloping the site into a medical office building. To support this redevelopment, Cambria Environmental Technology, Inc. (Cambria) performed a subsurface investigation to profile the site for remedial excavation. Onsite wells A, B, B-1 through B-4 were destroyed by pressuring grouting prior to the excavation. Cambria advanced 22 borings to a maximum depth of 23 fbg with a direct-push rig. Because the excavations were to be shored to protect adjacent roadways and other structures, an additional 17 borings were advanced outside the proposed excavation boundaries with regulatory approval as an alternative to sidewall sampling during excavation. In addition, Secor advanced 25 borings across the entire property to a maximum depth of 24 fbg to provide additional characterization of Site soils. Additional information is available in Cambria's January 24, 2007 Site Investigation and Remedial Excavation Report and Secor's March 6, 2006 Soil Characterization Report.

REMEDIATION HISTORY

1983 – 1995 Groundwater Extraction

IT Enviroscience and Gettler-Ryan Inc. extracted LNAPL from Site wells from 1983 through 1987. Over 200 gallons of LNAPL/water mixture were removed from the wells during this period. LNAPL removal resumed between June 1993 and March 1995, and an additional 32 gallons of LNAPL was removed from wells B, B-2 and B-3.

1988 Tank Removal

All station and fueling facilities, including the USTs, were removed by Blaine Tech Services, Inc. Approximately 3,500 gallons of LNAPL and groundwater were removed from the excavation. No information is available regarding the amount of soil removed by overexcavation from the UST pits.

1992 SVE Pilot Test

Weiss performed a soil vapor extraction (SVE) pilot test at the site. The data suggested that SVE would not be effective at this site based on a relatively high vacuum required to induce low flow rates. Additional information available in Weiss's April 7, 1992 Soil Vapor Extraction Test Report.

2001 LNAPL Removal

Product skimmers were installed in wells B and B-2, and were maintained monthly by Gettler-Ryan until 2004. No report was issued to document removal of the skimmers or the amount of groundwater and hydrocarbons removed.

2006 and 2007 Remedial Excavation

Excavations by Chevron and Kaiser occurred at the site from 2006 to 2007. The Chevron excavation encompassed a 25-foot wide, 147-foot long and 20-foot deep strip along the southern property boundary. Approximately 2,800 cubic yards of hydrocarbon impacted soil were removed from the excavation. The excavation was limited by proximity to the street and other adjacent structures. Confirmation soil samples were collected from ten locations along the bottom of the excavation from 18 to 20 fbg. As indicted above, the excavation was shored and no sidewall samples could be collected. However, soil borings were drilled proximal to the shoring to collect data on residual hydrocarbon concentrations outside the excavation. Additional information is available in Cambria's January 24, 2007 Site Investigation and Remedial Excavation Report.

The Kaiser excavation encompassed an 80-foot wide, 125-foot long, and 15-foot deep excavation from the center to the northern property boundary. Approximately 5,000 cubic yards of hydrocarbon bearing soil were removed from the excavation.

Confirmation soil samples were collected from 40 locations along the bottom of the excavation at 15 foot by 15 foot centers to document hydrocarbon concentrations left-in-place. Additional information is available in Secor's June 11, 2008 Soil Management Implementation Report.

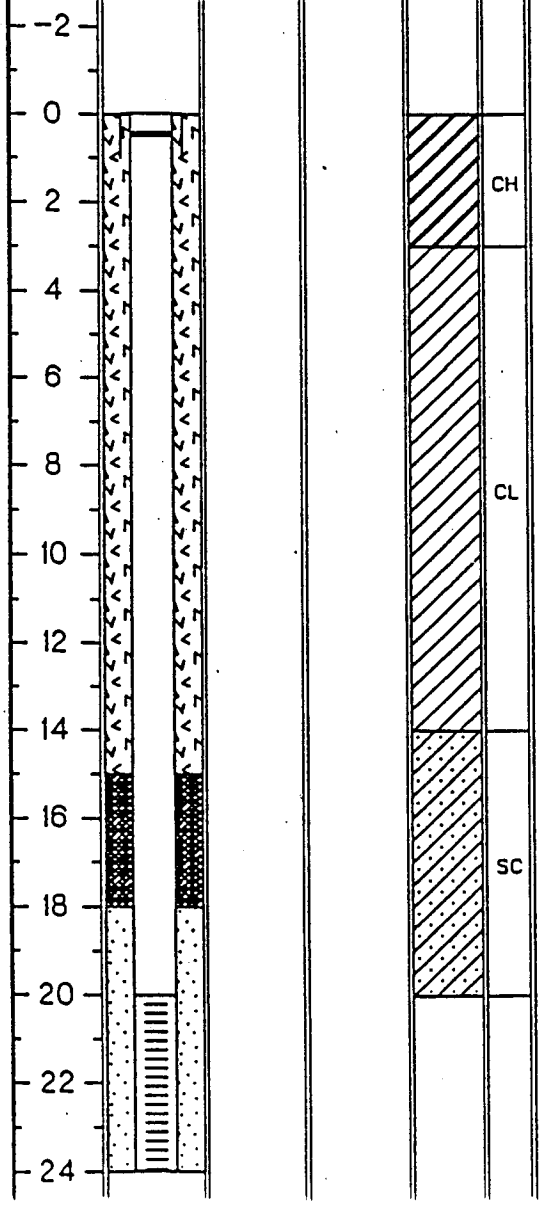
COMMENTS:

Orginal well was 20-feet deep. Lithology is from orginal boring by Kleinfelder & Associates, Groundwater Monitoring Well Installation Report, Candie's Chevron Station, Oakland, California April 6, 1982.



Description

(Color, Texture, Structure)
Trace < 10%, Little 10% to 20%, Some 20% to 35%, And 35% to 50%

This well is a replacement for the original "E" well. The original well was abandoned by extracting the casing and reaming out the annulus. The boring was then extended to 35 feet and a monitoring well constructed as shown in the well completion diagram.

Dark brown silty CLAY (trace of fine sand, moist and medium stiff)

Grades yellow brown

Hard drilling through stiff clay at 11 to 12 feet

Yellow to olive brown fine sandy CLAY to clayey SAND (saturated and medium dense)

The extended portion of the soil boring was not logged.

APPENDIX D

LOW–THREAT CLOSURE CHECK LIST

Site Name: Former Chevron Station 91026
Site Address: 3701 Broadway, Oakland, California

Site meets the criteria of the Low-Threat Underground Storage Tank (UST) Case Closure Policy as described below.[1]

General Criteria General criteria that must be satisfied by all candidate sites:	
Is the unauthorized release located within the service area of a public water system?	☒ Yes ☐ No
Does the unauthorized release consist only of petroleum?	☒ Yes ☐ No
Has the unauthorized ("primary") release from the UST system been stopped?	☒ Yes ☐ No
Has free product been removed to the maximum extent practicable?	☒ Yes ☐ No ☐ NA
Has a conceptual site model that assesses the nature, extent, and mobility of the release been developed?	☒ Yes ☐ No
Has secondary source been removed to the extent practicable?	☒ Yes ☐ No
Has soil or groundwater been tested for MTBE and results reported in accordance with Health and Safety Code Section 25296.15?	☒ Yes ☐ No
Does nuisance as defined by Water Code section 13050 exist at the site?	☐ Yes ☒ No
Are there unique site attributes or site-specific conditions that demonstrably increase the risk associated with residual petroleum constituents?	☐ Yes ☒ No
Media-Specific Criteria Candidate sites must satisfy all three of these media-specific criteria: **1. Groundwater:** To satisfy the media-specific criteria for groundwater, the contaminant plume that exceeds water quality objectives must be stable or decreasing in areal extent, and meet all of the additional characteristics of one of the five classes of sites:	
Is the contaminant plume that exceeds water quality objectives stable or decreasing in areal extent?	☒ Yes ☐ No ☐ NA
Does the contaminant plume that exceeds water quality objectives meet all of the additional characteristics of one of the five classes of sites? If YES, check applicable class: ☐ **1** ☐ **2** ☐ **3** ☐ **4** ☒ **5**	☒ Yes ☐ No ☐ NA

[1] Refer to the Low-Threat Underground Storage Tank Case Closure Policy for closure criteria for low-threat petroleum UST sites.

For sites with releases that have not affected groundwater, do mobile constituents (leachate, vapors, or light non-aqueous phase liquids) contain sufficient mobile constituents to cause groundwater to exceed the groundwater criteria?	☐ Yes ☐ No ☒ NA
2. Petroleum Vapor Intrusion to Indoor Air: The site is considered low-threat for vapor intrusion to indoor air if site-specific conditions satisfy all of the characteristics of one of the three classes of sites (a through c) or if the exception for active commercial fueling facilities applies. **Is the site an active commercial petroleum fueling facility?** Exception: Satisfaction of the media-specific criteria for petroleum vapor intrusion to indoor air is not required at active commercial petroleum fueling facilities, except in cases where release characteristics can be reasonably believed to pose an unacceptable health risk. **a. Do site-specific conditions at the release site satisfy all of the applicable characteristics and criteria of scenarios 1 through 3 or all of the applicable characteristics and criteria of scenario 4?** If YES, check applicable scenarios: ☐ **1** ☐ **2** ☐ **3** ☐ **4** **b. Has a site-specific risk assessment for the vapor intrusion pathway been conducted and demonstrates that human health is protected to the satisfaction of the regulatory agency?** **c. As a result of controlling exposure through the use of mitigation measures or through the use of institutional or engineering controls, has the regulatory agency determined that petroleum vapors migrating from soil or groundwater will have no significant risk of adversely affecting human health?**	☐ Yes ☒ No ☐ Yes ☒ No ☐ NA ☐ Yes ☒ No ☐ NA ☒ Yes ☐ No ☐ NA
3. Direct Contact and Outdoor Air Exposure: The site is considered low-threat for direct contact and outdoor air exposure if site-specific conditions satisfy one of the three classes of sites (a through c). **a. Are maximum concentrations of petroleum constituents in soil less than or equal to those listed in Table 1 for the specified depth below ground surface (bgs)?** **b. Are maximum concentrations of petroleum constituents in soil less than levels that a site specific risk assessment demonstrates will have no significant risk of adversely affecting human health?** **c. As a result of controlling exposure through the use of mitigation measures or through the use of institutional or engineering controls, has the regulatory agency determined that the concentrations of petroleum constituents in soil will have no significant risk of adversely affecting human health?**	☒ Yes ☐ No ☐ NA ☐ Yes ☐ No ☒ NA ☐ Yes ☐ No ☒ NA
