Request for Work Plan
Unocal Service Station #5366
7375 Amador Valley Blvd.
Dublin, California

Dear Ms. Chu:

This letter is written in response to your letter dated August 1, 1994, that stated that "additional investigations are required to delineate the extent of the contaminant plume".

As you are aware, subsurface investigations have been conducted at all four corners of the intersection of Amador Valley Boulevard and Village Parkway (Unocal, Arco, BP, and former Shell service stations). A minimum of five monitoring wells have been installed at each of the service station sites. A quarterly joint monitoring and sampling program is currently being performed by the respective consultants for each site. The water level data and a Potentiometric Surface Map for the May 17, 1994, joint monitoring event was included in MPDS Services, Inc's. Quarterly Data Report (MPDS-UN5366-02) dated June 29, 1994.

The analytical results of the most recent groundwater samples collected from all four service stations are summarized in the attached Table 1, and the concentrations of total petroleum hydrocarbons (TPH) and benzene are shown on the attached Figure 1.

Based on the groundwater samples that have been collected to date from all four service stations, elevated concentrations of petroleum hydrocarbons have been historically detected in the monitoring wells that are located closest to the intersection of Amador Valley Boulevard and Village Parkway (Unocal - MW5, Arco - MW3, BP - AW6, Shell - MW6). Therefore, it is likely that contamination is present within the intersection as well as within the streets in between the respective sites. Therefore, it is Unocal's opinion that additional delineation in between the respective sites is not warranted. In addition, the intersection of Amador Valley Boulevard and Village Parkway is very busy, which

makes the installation and subsequent sampling of a monitoring well in the intersection impractical as well as a safety issue.

Unocal and our consultant, Kaprealian Engineering, Inc. (KEI), are currently in the process of evaluating various groundwater remediation techniques that would: 1) be effective in cleanup of petroleum hydrocarbons in the vicinity of Unocal's wells, MW1 and MW5 and 2) minimize the potential to cause contamination from nearby sites to migrate onto the Unocal site. We would appreciate the opportunity to discuss various cleanup options with you, and will be contacting you in the near future to arrange a meeting.

If you have any questions or comments regarding this letter, please do not hesitate to contact me at (510) 277-2311.

Sincerely,

Edward C. Ralston
Senior Environmental Geologist
