Final Report - Underground Storage Tank Removal

Linford Air & Refrigeration Company

2850 Poplar Street

Oakland, California 94608

井 01-6913

CALIF. REG. WATER

Dear Mr. Hiett:

Please find attached a copy of Aqua Science Engineers, Inc's. (ASE) Final Report regarding Linford Air & Refrigeration in Oakland, California. This report details the tank pulling operations of a 5,000 gallon steel diesel tank and a 10,000 gallon fiberglass gasoline tank, the sampling and analysis of the excavated soils, and the backfilling and compaction of the former tank pits.

If you have any questions or comments, please feel free to give us a call at (510) 820-9391.

Respectfully submitted,

AQUA SCIENCE ENGINEERS, INC.

David Allen

Project Engineer

1.0 INTRODUCTION

This report documents the removal and related activities of the underground storage tank closure performed at Linford Air & Refrigeration (Linford), 2850 Poplar Street, Oakland, California. As of the date of tank removal, the property is reportedly owned by Linford. The following tanks were removed from the site; one (1) fiberglass 10,000 gallon gasoline underground storage tank and one (1) steel 5,000 gallon diesel underground storage tank. The scope of services provided by Aqua Science Engineers, Inc. (ASE) is in accordance with ASE proposal No. 92-032 and includes the following tasks:

- o Obtain necessary permits from appropriate agencies.
- o Remove and dispose of liquids from the tanks.
- o Remove and dispose of the underground storage tanks.
- o Sample and analyze the soil beneath the tanks.
- o Prepare a report of methods and findings.

2.0 PERMITS

The approvals/permits to remove the underground storage tanks were obtained from the City of Oakland Fire Prevention Bureau, the Alameda County Health Care Services Department, CAL-OSHA, and the Bay Area Air Quality Management District. Copies of the permits, applications, forms and notification documents are contained in Appendix A.

3.0 LIQUID REMOVAL

The two tanks contained approximately 900 gallons total of product along with approximately 50 gallons of rinseate water used to clean the tanks insides. The liquid was pumped out and transported to the Demenno Kerdoon Facility in Compton, California under a hazardous waste manifest by Waste Oil Recovery (WORS), a licensed hazardous waste hauler. See Appendix B for copies of manifest.

4.0 MOBILIZATION

ASE mobilized for on-site work on July 23, 1992. Project personnel included: Steve De Hope- Construction Manager, Field Personnel- Steve LaBare and John Sabia.

4.1 EXCAVATION

On July 23, ASE personnel began tank pulling exercises by sawcutting the perimeter of the tank pit to a depth of 7 inches. On the morning of July 24, ASE personnel removed the concrete cover, stockpiled the concrete on site, and began excavation.

4.1a: 5,000 Gallon Diesel Tank

Due to the location of the underground tanks (See Figure 1 for location of tanks). ASE began excavation of the 5,000 gallon diesel tank prior to addressing the 10,000 gallon gasoline tank. Approximately 6 inches of A.C. was removed which exposed approximately 6-8 inches of base rock followed by a silty, sandy clay backfill material. Native material consisted of a stiff clay. As the tank excavation activities continued, the Groundwater was encountered in the associated piping was removed. tank pit at approximately 11 feet. Soils excavated from the diesel tank pit were heavily stained and a strong petroleum odor was evident. sampling was conducted throughout excavation activities as well as Lower Explosive Limits (LEL) readings being taken. No action levels were encountered; however, ASE personnel and Linford representatives took all necessary precautions to ensure proper ventilation was available in adjacent shop areas.

4.1b: 10,000 Gallon Fiberglass Gasoline Tank

ASE personnel removed approximately 6 inches of concrete reinforced with #4 rebar in preparation to excavate the tank. As with the previous tank, all associated piping was removed as the tank was excavated. The original tank pit backfill (what ASE descibes as native material) was 3/8-inch, rounded pea gravel to 6 inches below grade. ASE excavated the pea gravel and stockpiled it on the concrete deck adjacent to the tank pit. The pea gravel was moist with groundwater and a petroleum odor was apparent. Groundwater was measured at approximately 11 feet. Air monitoring was conducted at the edge of the excavation; once again no action levels were reached.

4.2 TANK REMOVAL

Prior to tank removal on the morning of July 27, 1992, ASE inerted the tanks by adding dry ice at the rate of at least 1.5 pounds per 100 gallons of tank volume. The tank removal operations were witnessed by

the Alameda County Health Care Services Department Inspector - Mr. The Oakland Fire Prevention Bureau was notified, but had not yet arrived at the time scheduled for tank removal activities. Inspector Oliva gave authorization to ASE to proceed with the tank removal procedures. After verifying a safe LEL of the tank atmosphere, the first vessel, the 5,000 gallon diesel tank, was removed from the excavation by use of a 75-ton crane. The tank was placed on plastic and cleaned by hand to expose the tank surface. The diesel tank. constructed of 5/16 inch steel plate with welded seams, appeared to be in good condition. From there, the vessel was hoisted and placed on a 40 foot trailer and transported and disposed of by Erickson, a licensed hazardous waste hauler, to the Erickson Tank Disposal Facility in Richmond, CA, on the date of removal. Copies of the Hazardous Waste Manifest and Tank Disposal Certificate are contained in Appendix B. Upon removal of this vessel, groundwater was exposed and encountered at approximately 11 feet; floating product was present, and a heavy petroleum odor was apparent. In an attempt to reduce odor levels and to remove as much of the free-floating product, ASE contracted the services of WORS, a licensed hazardous waste hauler. WORS pumped the liquid out to a predetermined level as prescribed by ASE personnel, Mr. Steve De Hope, and Mr. Oliva. See the hazardous waste manifest regarding the extracted liquid in Appendix B.

ASE then proceeded to begin tank removal activities on the 10,000 gallon fiberglass tank. The Fire Department representative was still not present. Steve De Hope and Mr. Oliva measured the LEL levels of the vessel and found levels to be higher than the accepted to be able to remove the tank. Additional dry ice was added to the vessel and was allowed to purge. At approximately 1:00 p.m., Inspector Valida Holmes with the Oakland Fire Prevention Bureau arrived on site. The LEL was once again measured in the presence of both agencies, and was verified as being within safe levels to continue tank removal activities. The tank was lifted from the pit by use of a 75-ton crane, and placed on plastic; it was cleaned by hand to expose the tank surface. Upon thorough inspection, a pin hole was found in the rib of the tank sidewall. tank was hoisted and strapped to a truck and transported and disposed An Underground Storage Tank Unauthorized Release (Leak)/Contamination Site Report form was submitted, see Appendix D. Groundwater was encountered at approximately 10 feet, 2 feet of standing water was measured at the tank pit bottom. Up to 2 inches of product was encountered floating on the groundwater; heavy petroleum odors were present upon tank removal from the pit. Groundwater in the pit was pumped out as in the previous section. After necessary

sampling procedures were performed, a 3 feet thick layer of pea gravel was placed in the pit on top of the groundwater to help prevent the discharge of additional petroleum odors.

4.3 OVER EXCAVATION

On August 3, 1992, ASE personnel remobilized onto the site to perform an over excavation of the sidewalls and bottom of the 5,000 gallon diesel tank pit. Approximately 40 cubic yards of contaminated soil was removed and stockpiled separately from the existing overburden stockpiles. The stockpile, as were all stockpiles, was covered with plastic and secured

5.0 SAMPLING AND ANALYSIS

5.1 Tank Pit Areas

Four soil samples were extracted from the tank pits, two from the diesel tank pit and two from the gasoline tank pit. The soil samples were collected by ASE personnel, Construction Supervisor, Steve De Hope, trained in sampling protocol by a registered civil engineer. diesel tank pit, sample DSW-SW was collected 8 feet below ground surface from the sidewall of the southwest corner of the tank pit. Also in the diesel tank pit, sample DSW-NW was collected 8 feet below ground surface from the sidewall of the northwest corner of the pit. From the gasoline tank pit, sample GSW-S was collected 9 feet below ground surface from the sidewall of the south end corner of the pit. Also from the gasoline tank pit, sample GSW-NE was collected 9 feet below ground surface from the northeast corner of the tank pit (see Figure 1 for locations of tank pits and sample locations). Soil samples were secured using aluminum foil, capped, and sealed with tape. All samples were put on ice and transported directly to the analyzing laboratory under chain of custody procedures.

The samples were submitted for analysis to the state certified laboratory, Priority Environmental Labs in Milpitas, California (408) 946-9636. The soil samples taken were analyzed for Total Petroleum Hydrocarbons as Gasoline (EPA 5030/8015), Diesel (EPA 3550/8015), and BTEX (EPA 8020). Analysis results are shown below (Table One) and hard copies can be found in Appendix C.

TABLE ONE: SOIL SAMPLE RESULTS

Sample No.	TPH Gasoline (ppm)	TPH Diesel (ppm)	Benzene (ppb)	Toluene (ppb)	Ethyl Benzene (ppb)	Total Xylenes (ppb)
DSW-NW	1300	34	200	5300	3200	1600
DSW-SW		88				
GSW-NE	330	ND	1800	3800	3000	11000
GSW-S	2000		2600	5800	3400	18000
STKP-1-A	• •	120	1800	4500	3300	17000

* - Composited sample

ND - Non Detectable at analytical method limits

ppm - parts per million ppb - parts per billion

5.2 Soil Stockpiles

The two soil stockpiles, 1A and 2B (See Figure 1 for location), were sampled by ASE personnel Steve DeHope. Four samples were collected from each soil stockpile, and were secured and delivered as described in the previous section. Upon receipt of the samples, the laboratory composited the four samples collected from stockpile 1A and made one representative sample for analysis (STKP-1-A). The lab equally composited samples from 2B into one sample for analysis (STKP 2B). Analysis conducted on the composited samples was as described in the previous section. Analytical results can be found in the following table (Table Two), hard copies can be found in Appendix C. Stockpiled soils remained on site and covered pending profiling procedures necessary for disposal.

TABLE TWO: STOCKPILED SOIL SAMPLE RESULTS

Sample	TPH Gasoline	TPH Diesel	Ranzana	Toluana	Ethyl Benzene	Total
No.	(ppm)	(ppm)	(ppb)	(ppb)	(ppb)	(ppb)
STKP 1-A*		120 1100	1800 5500	4500 8900	3300 5900	17000 21000

* - Composited sample

ND - Non Detectable at analytical method limits

ppm - parts per million ppb - parts per billion

In total, approximately 100 tons of material were removed from the excavation, stockpiled and sampled.

5.0 BACKFILLING AND RESURFACING

Prior ASE LINFORD to backfilling proposed to placement/construction of groundwater extraction wells in each of the tank pits would be beneficial at the time of an open tank excavation for future (if necessary) groundwater remediation. Upon LINFORD approval, ASE installed 4", 0.020 slotted PVC casing horizontally at the bottom of the tank pit (see Figure Two for details). The horizontal piping was connected to a solid 4" PVC casing riser installed vertically to ground level. The wells were capped and a 2' x 2' steel well cover was installed over the riser to allow for future access to the wells for groundwater The well in the gasoline tank pit is located in a very extraction. productive aquifer and could be useful as part of a groundwater 'pump and treat' system if necessary. The well in the diesel tank pit, located in a less productive water zone, may only be useful as a skimming-type well; the recovery of extracted water during excavation in the diesel pit was not as productive as in the gasoline tank pit.

Once the groundwater extraction wells were installed, both the diesel and gasoline tank pits was backfilled with 3/8 inch, rounded, washed pea gravel to approximately 2 feet below grade in the diesel tank pit; approximately 8 inches below grade in the gasoline tank pit. Class II base rock was installed to within approximately 6 inches of the ground surface. A 6 inch concrete cap was laid to match the existing surface.

6.0 DISCUSSION AND CONCLUSIONS

One fiberglass 10,000 gallon gasoline underground storage tank and one steel 5,000 gallon diesel underground storage tank were removed from the site and transported as hazardous waste to the Erickson Facility in Richmond California, to be cleaned and disposed of as scrap.

The results of laboratory analysis of soil samples from the excavation sidewalls showed detectable concentrations of Total Petroleum Hydrocarbons (TPH) as gasoline and diesel. A copy of the certified laboratory results appear in Appendix C. The native soil at this elevation below the diesel tank did not appear clean, dry, or free of petroleum odor. An Underground Storage Tank Unauthorized Release form was prepared by Aqua Science and filed with the Alameda County Health Services Department. A copy of this form is in Appendix D.

It is the recommendation of Aqua Science Engineers, Inc. that, based on LUFT Manual Standards, a Phase II Site Investigation is necessary to further examine the site and to determine the vertical and lateral affects of the plume of the contaminants.

ASE appreciates having the opportunity to provide our services to Linford. If you have any questions or comments, please feel free to give us a call at (510) 820-9391.

Respectfully submitted,

Tank will be unexted introducing any les into the tank at a rate of at least 1.5105 of dry lee on 100 gallons of tank volume. HER will be checked with the tank are pumped out and inerted, all associated piping must be flushed out into the tanks. All accessible associated piping must then be removed. Inaccessible piping must be plugged.

The Bay Area Air Quality Management District (771-6000), along with local Fire and Building Departments, must also be contacted for tank removal permits. Fire departments typically require the use of explosion proof combustible gas meters to verify tank inertness. It is the contractor's responsibility to bring a working combustible gas meter on site to verify tank inertness.

15. Tank History and Sampling Information

Tar	nk	Material to be sampled	Location and	
Capacity	Use History (see instructions)	(tank contents, soil, ground-water, etc.)		
10,000 Gallono Gallono	Happeine Diesel	Soil and or grandwater	a just below the bottom of the teens a just below the bottom of the tank.	

One soil sample must be collected for every 20 feet of piping that is removed. A ground water sample must be collected should any ground water be present in the excavation.

Stockpiled Soil Volume (Estimated) Drul a 6"x2" brain tube und the coul at each end of the tank, peal ends w/ Aluminum fail and pleatic caps, Chill in Ceder with buse else. Transport to the laboratory under Chain of Usbody procedures and pleatic for TPH-Bacelile, BTEX and Duell.

stockpiled soil must be placed on bermed plastic and must be completely covered by plastic sheeting.

16. Chemical methods and associated detection limits to be used for analyzing samples

The Tri-Regional Board recommended minimum verification analyses and practical quantitation reporting limits should be followed. See attached Table 2.
