1.0 INTRODUCTION

The following is a report detailing the results of the May 2000 quarterly groundwater sampling at 2221 Union Street, Oakland, California (*Figures 1 and 2*).

2.0 GROUNDWATER ELEVATIONS

On May 16, 2000, ASE associate geologist Ian Reed measured the depth to water in all site groundwater monitoring wells using an electric water level sounder. The depth to water and groundwater elevations are presented in Table One, and a groundwater elevation (potentiometric surface) contour map is presented as Figure 2. The groundwater flow direction is to the northeast at a gradient of 0.01-feet/foot. The groundwater flow direction and gradient beneath the site has been highly variable and may be tidally influenced.

3.0 SAMPLE COLLECTION AND ANALYSIS

Prior to sampling, the monitoring wells were purged of four well casing volumes of groundwater using dedicated polyethylene bailers. The parameters pH, temperature and conductivity were monitored during the well purging. Samples were not collected until these parameters stabilized. The groundwater samples were collected using dedicated polyethylene bailers. The samples to be analyzed for volatile compounds were decanted from the bailers into 40-ml volatile organic analysis (VOA) vials, pre-preserved with hydrochloric acid and capped without headspace. All of the samples were labeled and placed in a cooler with wet ice for transport to Chromalab, Inc. of Pleasanton, California (ELAP #1094) under appropriate chain-of-custody documentation. Well sampling field logs are presented in Appendix A. The groundwater samples were analyzed for halogenated volatile organic compounds (HVOCs) by EPA Method 8010. The analytical results for this and previous sampling periods are presented in Table Two.

Well sampling purge water was contained in sealed and labeled 55-gallon steel drums and left on-site for temporary storage until off-site disposal can be arranged. The certified analytical report and chain-of-custody documentation are included as Appendix B.

4.0 CONCLUSIONS AND RECOMMENDATIONS

The groundwater samples collected from monitoring well MW-1 contained 7.8 parts per billion (ppb) vinyl chloride, 260 ppb tetrachloroethene (PCE), 73 ppb trichloroethene (TCE), and 10 ppb cis-1,2-dichloroethene (cis-1,2-DCE). Groundwater samples collected from monitoring well MW-2 contained 820 ppb PCE, 220 ppb TCE, and 74 ppb cis-1,2-DCE. The groundwater samples collected from monitoring well MW-3 contained 54 ppb PCE, 8.7 ppb TCE, 5.3 ppb 1,1-dichloroethane (1,1-DCA), and 11 ppb chloroform. The groundwater samples collected from monitoring well MW-4 contained 24 ppb PCE, 13 ppb TCE, 12 ppb cis-1,2-DCE, 19 ppb 1,1-DCA, 3.0 ppb 1,1,1-TCE, and 0.75 ppb vinyl chloride.

In general, there was an increase in HVOC concentrations detected in groundwater samples collected from monitoring wells MW-2 and MW-4. There was a decrease in HVOC concentrations detected in groundwater samples collected from monitoring well MW-1. HVOC concentrations detected in groundwater samples collected from monitoring well MW-3 were very similar to previous results. The HVOC concentrations in groundwater samples collected from all monitoring wells still remain well below the Oakland Risk Based Corrective Action (RBCA) levels for vapor intrusion from groundwater to an indoor air scenario.

ASE is currently preparing a sensitive receptor's survey consisting of an area well survey and water/conduit survey as requested by the Alameda County Health Care Services Agency (ACHCSA) in a letter dated March 7, 2000. This sensitive receptor survey will be completed within the next 45 days. It is ASE's understanding that the ACHCSA will assess the site for possible case closure at that time.

5.0 REPORT LIMITATIONS

The results of this assessment represent conditions at the time of the groundwater sampling, at the specific locations where the samples were collected, and for the specific parameters analyzed by the laboratory.

It does not fully characterize the site for contamination resulting from unknown sources, or for parameters not analyzed by the laboratory. All of the laboratory work cited in this report was prepared under the direction of an independent CAL-EPA certified laboratory. The independent laboratory is solely responsible for the contents and conclusions of the chemical analysis data.

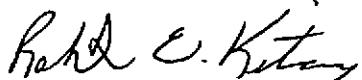

Aqua Science Engineers appreciates the opportunity to provide environmental consulting services for this project. Should you have any questions or comments, please feel free to call us at (925) 820-9391.

Respectfully submitted,

NOTES:

Non-detectable concentrations are noted by the less than sign (<) followed by the laboratory detection limit.

The Oakland risk based corrective action (RBCA) number is the cleanup goal for vapor intrusion from groundwater to an INDOOR AIR Scenario modified for groundwater at depths of 6-feet below ground surface.

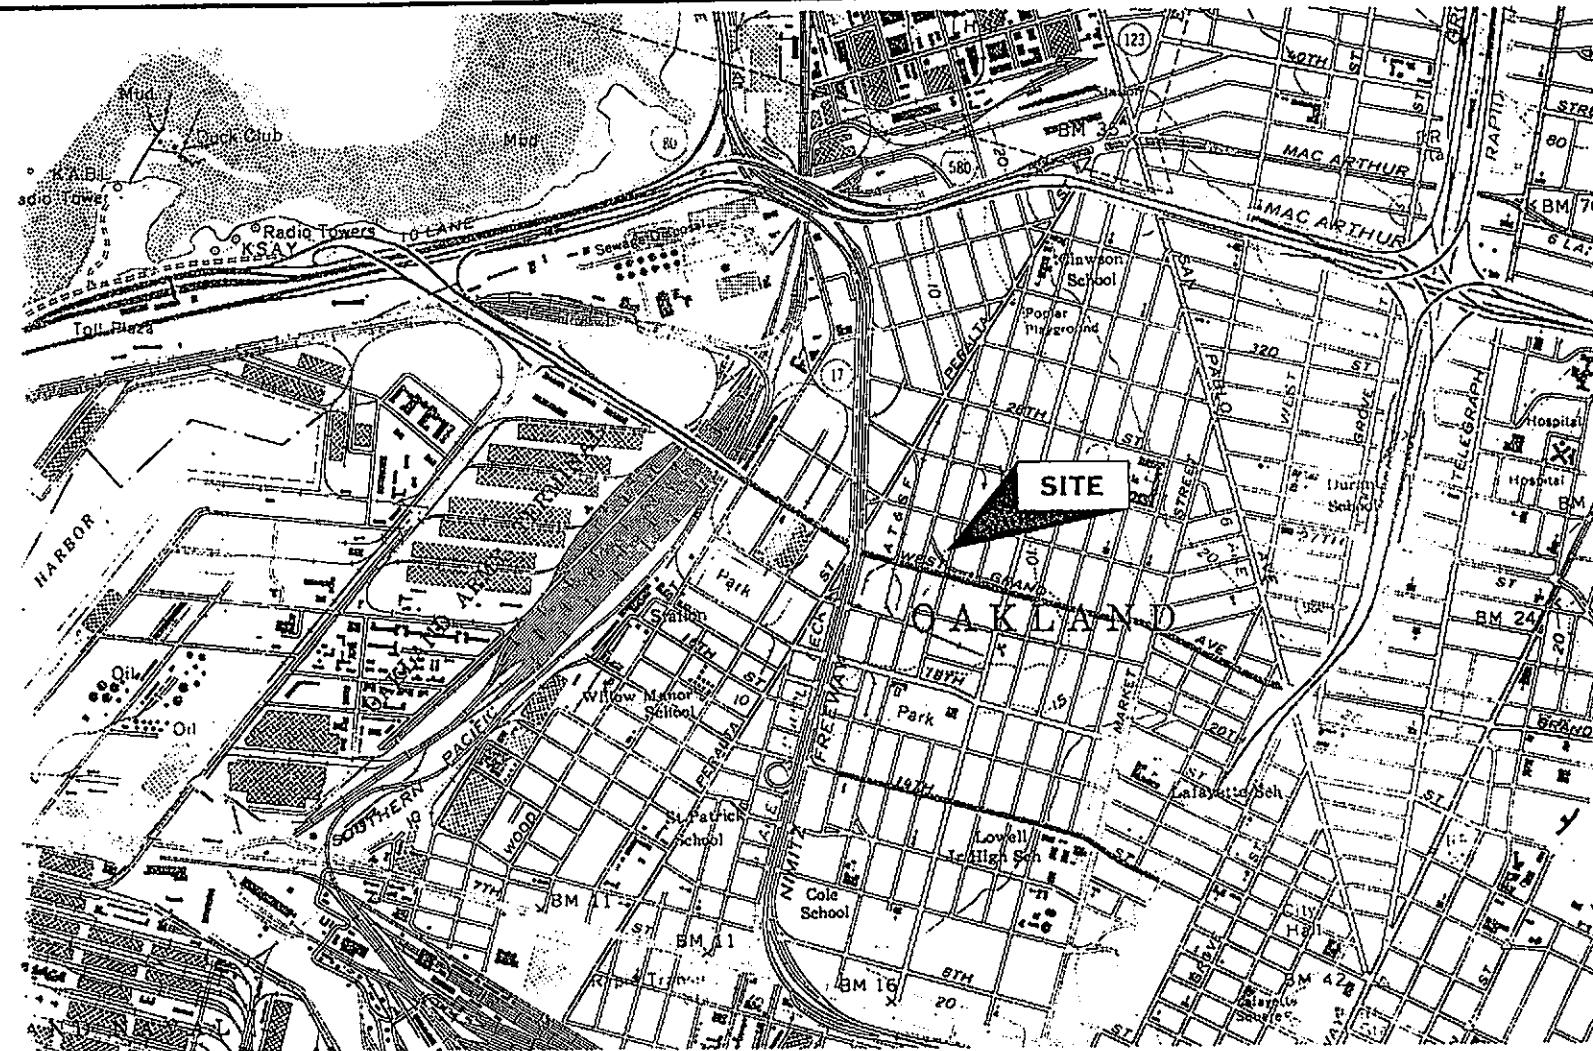

PCE is Tetrachloroethene

TCE is Trichloroethene

DCE is Dichloroethene

DCA is Dichloroethane

VC is Vinyl Chloride
