Re: **REPORT OF MONITORING WELL DESTRUCTIONS**

Dear Mr. Nowell,

Environmental Restoration Services (ERS) of Menlo Park, CA.. is pleased to submit to following monitoring well destruction report. Four monitoring wells (MW-1 trough MW-4), located at the above mentioned site, were destroyed under Alameda County Public Works (ACPW) permit and by ACPW protocol.

On February 18, 2013, ERS destroyed each well by pressure grouting. For each well, a neat cement grout, consisting of approximately 6 gallons of water per 94 pounds of Portland cement, was placed into the bottom, by means of a tremmie pipe, until the well was completely filled with grout. The top of the well casing was then pressurized at 25 p.s.i. for five minutes. The surface well box and existing surface concrete was jack-hammered and removed. The existing surface was patched with concrete. All well destruction work was inspected by ACPW personnel. The California Department of Water Resources' Well Completion Report forms for each of the destroyed wells are contained in this report.

An approximate 0.5 cubic yard well installations cuttings stockpile (for all four wells) remains on-site in a single stockpile. Two soil samples were collected from each well boring during installation. The samples were analyzed for TPH (C-10-28) and none were found to contain concentrations of TPH (C-10-28) above 5 mg/kg. The soil has been left on-site to be used as planting/landscape fill.

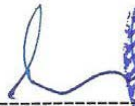

On June 30, 2012, ERS placed approximately 30 gallons of wash water, generated from decontamination of the boring equipment used during the October 2006 investigation and the September 2008 monitoring well installations (MW1-MW3), into a 12 foot diameter, shallow wall, open plastic containment. On the same day, ERS also placed approximately 70 gallons of groundwater, generated from initial monitoring well development and sampling procedures from four previous sampling events. The approximate 100 gallons of water filled the tank to a depth of approximately 6 inches. On August 29, 2012, all of the water within the containment had evaporated.

On February 26, 2013, approximately 45 gallons of groundwater, generated from initial monitoring well MW4 development and sampling procedures from two previous sampling events, and approximately 10 gallons of wash water, generated from decontamination of the boring equipment used during the March 2013 monitoring well MW4 installation, was transported as oily water by Maximum Oil Service of Vallejo, Ca (EPA #CAL000161741) and disposed of at Riverbank Oil Transfer of Riverbank, CA (EPA #CAL000190816) under consolidated Hazardous Waste Manifest 010510342. The disposal receipt is contained in this report.

Respectfully submitted this 26th day of February, 2014,

Bennett T. Halsted
Project Manager
