Jon Krain of EM Enterprises

Edited and Published by

John Chan of Dublin Multilayer, Inc.

INTRODUCTION

Dublin Multilayer Inc (DMI) is a printed circuit board manufacturer located at 6341 Scarlett Court in Dublin, California and established in November, 1979. Their hazardous materials activities were confined to the area described in Figures A-1, and A-2 and known as the "wet floor". Contained within the wet floor was a collection sump which existed prior to DMI's occupancy. DMI refurbished the sump prior to the commencement of work in 1979 because of its poor condition.

On January 15th of 1990, DMI had a fire originating from what appears to be an electrical equipment failure inside the wet floor area. However, after an extended review, fire investigation teams have concluded that the exact cause of the fire was of "unknown origin".

During the early hours of the fire, IT Corporation was asked to provide direction as a hazardous materials site manager throughout the two days of the firefighting effort. Afterwards, the local fire agency stipulated that they direct IT Corporation's fire and hazardous materials cleanup of the wet floor area. IT Corporation spent the next five days working under the direction of the Fire Department. It was during this time, that water from inside the wet floor and that standing water around the blocked drains was pumped into several large poly tanks for later disposal. In addition, IT Corporation under the instructions of the local fire agency removed all of the wood materials used in the construction of the wet floor and in the area above the plating sump (mezzanine) into a 40 yard debris bin for disposal at a Class-I site (see Attachment II-C).

Additional work in the hazardous materials areas stopped until a formal closure plan was submitted and approved by Dr. Ravi Arulanantham of Alameda County Department of Environmental Health (see Attachment I).

SUMMARY

On February 24, 1990, CKC Inc and DMI personnel dismantled the mezzanine above the wet floor area. All debris not contaminated or effected by Hazardous materials was disposed of into bins as nonhazardous material. All other material in, on or associated with the wet floor activities was disposed of into bins as hazardous debris and shipped to Chemical Waste Management (CWMI), Kettleman Hills for Class-I disposal (see Attachments II-A and II-B). Absorbent material was added to wet sludge to solidify it for shipment in the debris bins for Class-I disposal. All liquid effluents were pumped into storage tanks for treatment by Decon Environmental Inc (DECON).

By March 2, 1990, Delta Technical Services (Delta Tech) was bought in to decontaminate the wet floor area after all the secondary containment berms and barriers were removed. Delta Tech hydroblasted the floor several times and in between each successive washing, the floor was etched with 10% nitric acid (see Attachment VI-D). The liquid effluent was added to the already stored liquid. This procedures was satisfactory for the majority of the wet floor area, but in a few small areas copper staining was still evident. So in these areas, we chose to sandblast and this was very effective. The spent sandblast grit was disposed of with the hazardous solids.

To verify our success at decontamination of the wet floor area, wipe samples were taken by Blaine Technical on March 9, 1990. These samples did in fact confirm our success (see Attachments III-A, IV-A and Figure B).

On February 21, 1990, Dublin San Ramon Services District issued revised wastewater discharge requirements for the discharge of treated liquid effluents (see Attachment VI-A). Liquid effluents stored in bulk tanks were then treated by DECON

to remove heavy metals. They used the flocculation method incorporating the use of sodium hydroxide and sodium sulfide to enhance precipitation of metals for filtration. Confirmatory analysis were performed on treated batches (see Attachment III-B) and then were discharged into the sanitary sewer. The filter cake was place in bins for transport and recovery at Cypress Miami's facility in Claypool, Arizona (see Attachment II-D and II-E).

After decontamination was completed we noticed several etched areas, one was near an expansion joint, two were near stress cracks in the floor and one was near the edge of the building. This presented the potential for migration of contaminants, so we felt it necessary to investigate this possibility further. Core holes were drilled through the slab to facilitate sampling beneath the slab, as well as beneath the sump (see Figure C).

On March 27, 1990, a three inch hand auger was used by Western Geologic Resources (WGR) to collect samples from approximately one foot below the bottom of the slab and one foot below the bottom of the sump. The auger was washed between each boring to prevent cross contamination of samples. Samples were placed in glass jars with teflon seals and properly preserved. A sufficient quantity of soil was obtained for each sample to insure the absence of voids in the sample container. (see Attachment IV-C).

The samples beneath the floor were analyzed for copper, lead, nickel, chrome and hexavalent chrome. The sample beneath the sump was analyzed for all Priority Pollutants pursuant to 40 CFR and Title 22. (see Attachment III-C for sample results). Sample results showed elevated metals (copper, lead, nickel, chrome) in boring sites S-

3,S-4 and S-6, as well as methylene chloride, freon 113, TCE, 1,2 DCE and xylene in S-6 (see Figure C).

REMEDIATION

A six foot square hole was sawn in the concrete floor to access soils for excavation around sites S-3 and S-4. Upon excavation we encountered a visually contaminated zone approximately one foot thick, partially in the base fill material and partially in the native soil below the slab in site S-4 and below the asphaltic concrete (A/C) in S-3. It was necessary to enlarge the holes to twelve foot square to enable removal of all visually contaminated areas, as well as an additional one foot in each direction to insure complete removal of all contaminants. Final excavations were between three and four feet in depth and approximately twelve foot square.

For removal of the sump, we planned to remove two more feet around all sides and three more feet below the bottom before sampling. When the sump was first removed we noticed a minor degradation of the cast iron drain line to the sanitary sewer. We had encountered the same cast iron line at the edge of S-4 and had determined the line to be sound and intact. Because we did not know how much of the line was corroded, we cut open the floor and removed the entire line between S-6 and S-4, as well as an additional foot of soil below the line. The line showed signs of some corrosion, but was still intact. Upon completion of excavation of the sump, a concentrated pocket of chlorinated solvents was encountered (approximately six foot in depth).

Sample results showed the presence of TCE, PCE, and ethylbenzene (purchasing records show these solvents have not been used by DMI). Since the

property owner (Busick Properties) was aware of a potential previous release of this type of solvent, they assumed responsibility for the remediation of the sump area and associated VOC problem.

Samples were taken to determine if all heavy metal contamination had been removed (see Figure D). Sample results confirmed sufficient remediation and the trench and excavations around S-3 and S-4 were closed (see Attachment III-D).

Heavy metal soils were then stabilized using the IM-TECH method (see Attachment IV-B) and samples were taken to verify that the treated soils met non-hazardous standards (see Attachment III-E). Soils were then transported to Liquid Waste Management McKittrick, CA for disposal (see Attachment II-G).

A report on the subsequent remediation of VOC contaminated soils and groundwater associated with the sump will be submitted by Busick Properties and their consultants at a later date.

POSTSCRIPT

We would like to thank the associated agencies and personnel for their dedication and forthrightness towards helping us conclude this situation. In particular, these individuals made a difference as a result of their knowledge, their guidance, their attention for the safety of the public and professionalism: Tom Hatchcox (Dublin Fire Department), Tom DeHollander (Dublin San Ramon Services District), Dr. Ravi Arulanantham (Alameda County Department of Environmental Health).

February 24, 1990

Alameda County Health Agency
Division of Hazardous Materials
Department of Environmental Health
80 Swan Way, Room 200
Oakland, California 94621

Attention: Ravi Arulanantham

Dear Ravi,

Please accept the enclosed work schedule for the decontamination of Dublin Multilayer's fire damaged wet process area. All of the contractors we have retained for this project are trained and experienced in hazardous materials operations. They and all of us at Dublin Multilayer are determined to proceed in a manner that is safe, responsible, in full compliance with all applicable codes and with the guidance of your department and the Dublin San Ramon Water Services Department.

We have attached a check for $500.00 payable to the Division of Hazardous Materials. It is our understanding that charges for your services will be deducted at the rate of $50.00 per hour and the balance refunded to us at the close of this project. Please reference our purchase order number 8254 for these transactions.

Respectfully,

Jon Krain
Facilities Manager

February 24, 1990

WORK SCHEDULE FOR DECONTAMINATION OF THE WET PROCESS AREA SUBSEQUENT TO FIRE OF JANUARY 15, 1990:

1. Remove all liquid hazardous materials from tanks, equipment, sumps and wet floor and store for future batch treatment.

   Completed by International Technology Corporation; 2/2/90.

2. Remove all non-contaminated equipment from the area to trash roll-off bin or to secure holding area pending disposition by insurance companies.

   Completed by employees of Dublin Multilayer trained and experienced in working in a hazardous wet process area and in the proper use of safety equipment; 2/22/90.

3. Remove collapsed mezzanine to trash roll-off bin.

   Completed by employees of Dublin Multilayer; 2/21/90.

4. Remove wet floor and existing containment area to solid hazardous waste bins. Remove contaminated equipment to secure area for future decontamination and storage pending insurance company disposition.

   CKC Incorporated placed two hazardous waste bins on site; 2/23/90.

   CKC Incorporated, with assistance from employees of Dublin Multilayer, will begin on Monday 2/26/90 and complete within one week.

5. Exposed concrete floor, sumps and contaminated equipment will be hydroblasted and effluent stored for future batch treatment.

   Delta Tech Service, Inc. will begin on Thursday 3/1/90 and complete within one week.

6. The wet process area and sumps will be tested for formal closure; if remediation is necessary a plan of action will be submitted for approval by The Alameda County Health Agency.

   Steven L. Williams will supervise this process beginning by 3/8/90 and completing within two weeks.

7. All hazardous liquids on site will be batch treated and treated water will be discharged into the sanitary sewer system in accordance with the directives of the Dublin San Ramon Water Services Department. Solid filter cake generated from this process will be stored in bins provided by Chemical Waste Management, Inc. for future off-site metal reclamation.

   Decon Environmental Services, Inc. began staging this step on 2/23/90 and will finish within three weeks.

8. All hazardous and non-hazardous solid and liquid waste will be removed on an on-going basis as required to maintain free access to the work site.

9. Dublin Multilayer, Inc will report and document all work done and the disposition of all materials within one week of the completion of the above. March 26, 1990 is our target date.

II. MANIFESTS AND SHIPPING DOCUMENTS

ATTACHMENTS

II-A. Manifest 88448274 (02-28-90): 2 bins fire debris to CWMI

II-B. Manifest 88448269 (03-01-90): 2 bins fire debris to CWMI

II-C. Manifest 88448270 (03-23-90): 1 bin fire debris to CWMI

II-D. Manifest 88248442 (09-05-90): 1 rollon bin treated sludge to Haz/Control

II-E. Manifest 88247434 (09-14-90): consolidation of sludge to Cypress Miami

II-F. Manifest 90203930 (09-14-90): spent chromic and black oxide to Solvent Services

II-G. Shipping form (09-17-90): stabilized soil to Liquid Waste Management

Form Approved OMB No. 2050—0039 (Expires 9-30-91)

GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a goood faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

SAMPLING REPORT 900308-K-1

Blaine Tech Services, Inc. performs specialized environmental sampling and documentation as an independent third party. In order to avoid compromising the objectivity necessary for the proper and disinterested performance of this work, Blaine Tech Services, Inc. does not participate in the interpretation of analytical results or become involved with the marketing or installation of remedial systems. The interpretation of results should be performed by representatives of interested regulatory agencies and/or those professionals who are engaged as paid consultants in the business of providing opinions and proposals for further investigation or clean-up activities.

This report describes environmental sampling and documentation performed by our firm on this project. In addition to the Sampling Report text itself, supporting documents are provided as attachments. These include the chain of custody and the certified analytical laboratory report. All these documents should be kept together and preserved as a file of interrelated records which, together, comprise the documentation of the work performed at the site.

ATTACHMENT
IV-A

Background

Dublin Multi-Layer is a firm that does some metal plating. Following a fire in their plating building, the building was demolished except for the concrete floor. The concrete floor has stains from the plating operation and was sand blasted and acid etched to remove the contaminants. Mr. Steve Williams of Dublin Multi-Layer contacted Blaine Tech Services, Inc. office personnel in order to obtain a wipe sample of the concrete floor after it was etched.

Scope of Requested Services

In accordance with your request, field personnel would be dispatched to the site to collect wipe samples from the concrete floor of the demolished plating building. We would arrange for the proper analyses of the samples and maintain adequate documentation resulting in the issuance of a formal Sampling Report.

Execution of the Work

Personnel were dispatched from our office and arrived at Dublin Multi-Layer on Thursday, March 8, 1990. Our personnel met with Mr. John Crain of Dublin Multi-Layer and Mr. Steve Williams his project manager. Mr. Williams instructed our personnel to collect a total of eight wipe samples from the concrete floor.

Four sets of 100 square centimeter sampling grids were mapped out on the concrete floor. Each set consisted of two adjacent grids. Within each grid, one wipe sample was obtained. One sample was submitted to the laboratory to be analyzed for metals. The other sample was obtained as a duplicate and submitted to the laboratory with instructions to be placed the hold and analyzed only if the adjacent grid sample showed values greater than ten times the STLC.

The location of individual sampling points is shown on the diagram on page three. Additional information on the exact method of sample collection will be found in the SAMPLING METHODOLOGY section of this report.

After completion of the field work, the samples were delivered to Sequoia Analytical Laboratory in Redwood City, California. Sequoia Analytical Laboratory is a California Department of Health Services certified Hazardous Materials Testing Laboratory and is listed as DOHS HMTL #145.

SAMPLING METHODOLOGIES USED ON THIS PROJECT

Wipe Sample: Each wipe sample is taken from the inside of a standardized sampling area which is usually a square or rectangle "grid" that contains 100 square centimeters. The method used to collect the sample involves using only one side of a filter paper "wipe" which is manually moved back and forth across the interior of the box. The wipe preparation is specific to the analysis that will be performed on the resulting sample. For example,

a wipe that is going to be used to collect material that will be analyzed for metals and pH would be prepared with deionized water. A sample that is to be analyzed for total oil and grease would be prepared with freon.

In the work performed on this project, each sample that was analyzed for metals consisted of four sampling grids that were sampled with four wipes. The wipes were specially prepared. One wipe was used to obtain surface residue from one of four 100 square centimeter sampling grids which were adjacent to each other. The grid was wiped using one side of the wipe and then placed then in a plastic bag. A duplicate sample was obtained from each of the four sampling grids in the same manner as the initial samples.

Sample Designations

All sample containers are identified with both a sampling event number and a discrete sample identification number. Please note that the sampling event number is the number that appears on our chain of custody. It is roughly equivalent to a job number, but applies only to work done on a particular day of the year rather than spanning several days as jobs and projects often do. This is followed by the sample I.D. number which is usually a simple number such as #1, #2, #3.

Chain of Custody

Samples are continuously maintained in either a chilled ice chest, refrigerator, or freezer from the time of collection until acceptance by the State certified Hazardous Materials Testing Laboratory selected to perform the analytical procedures. If the samples are taken charge of by a different party (such as another person from our office, a courier, etc.) prior to being delivered to the laboratory, appropriate release and acceptance records are made on the chain of custody (time, date, and signature of person releasing the samples followed by the time, date and signature of the person accepting custody of the samples).

Laboratory Identification Numbers

Following receipt of the samples and completion of the Chain of Custody form, the laboratory then assigns their own identification numbers to the samples. Different laboratories use different numbering systems and, according to their own internal conventions, may or may not assign sequential numbers to samples which are placed on temporary "hold", pending the results of other analyses. Laboratory identification numbers (if assigned and available) are included on the DIAGRAM page, and will be found on the certified analytical report by the analytical laboratory.

Certified Analytical Report

The certified analytical report generated by the laboratory is the official document in which they issue their findings. The certified analytical report is included as an attachment at the close of this report.

Please call if we can be of any further assistance.

Richard C. Blaine

DECON
ENVIRONMENTAL SERVICES, INC.

DECON Soil & Water Sampling Protocols

Surface Soil Sampling

The methods described in this section are used when collecting soil or sediment samples in the uppermost 2 feet. Surface soil samples for chemical or physical analysis are collected using a soil sampling hammer with a 2 inch diameter, 6 inch long brass liner tube. The sampler is driven into the top 6 to 24 inches of soil and then removed and disassembled to permit the retrieval of the soil sample. The ends of the tube are covered with aluminum foil and then capped. The tube is labelled and immediately placed into a pre-cooled ice chest chilled to less than 4 degrees Centigrade. Labels contain the following information: site name, date and time sampled, sample identification, and analysis to be performed on the sample. The samples are transported under chain of custody to a state certified laboratory. The laboratory analyzes soil samples within the prescribed holding time, storing them at temperatures below 4 degrees Centigrade at all times.

DECON uses new sterile brass tubes for sampling. Between each sample collected, the sampling hammer is cleaned with trisodium phosphate (TSP) and rinsed with distilled, deionized water.

Water Sampling

Samples from open surface water will be collected by direct submergence of the sample bottle. The sample bottle is capped with a Teflon lined lid and then wiped dry with a rag and immediately labelled with the following information: site name, date and time sampled, sample identification, and analysis to be performed on the sample. When a sample is suspected to contain volatile constituents, the sample should immediately be placed into an ice chest pre-cooled to 4 degrees Centigrade. Preservative are not added to any sample unless instructed. Under no circumstances are sealed sample containers opened by anyone other than the laboratory personnel who perform the requested analyses.

Water samples are not held for more than 14 days prior to analysis and are kept at 4 degrees Centigrade at all times.

To document and track samples from time of collection, a signed chain of custody record is completed by the sampler and accompanies the samples through the laboratory sample acceptance. The completed chain of custody is included with the analytical report from the laboratory.

DECON's Stabilization Process

DECON provided all labor, materials, and equipment to stabilize the contaminated soil using the IM-TECH process. This section describes the process, processing equipment and operation.

The IM-TECH stabilization process was developed and patented by Mr. Ray Funderburk, the president and founder of IM-TECH (formerly Hazcon, Inc.). It has been evaluated and approved by the EPA under their Superfund Innovative Technology Evaluation (SITE) program.

The IM-TECH (or Hazcon) process was designed to stabilize heavy metals in a wide variety of matrices, including refinery sludges and contaminated soil containing high levels of organic compounds. As shown in Table 1, this process has been proven effective for stabilization of many different heavy metals, PNA's, VOC's and other organic compounds.

Process Chemistry

The IM-TECH process is based on chemical fixation of heavy metals and oxidation of organic compounds using the proprietary chemical formulation called Chloranan. In addition, the process uses pozzolanic materials (cement, lime, kiln dust, or fly ash) to stabilize the treated waste material. The resulting product has leachabilities that are below established standards when analyzed by TCLP and Cal WET methods.

Chloranan catalyzes a number of chemical and physical changes to the waste material which reduce the leachability of both organic and inorganic compounds present. Chloranan contains a polymer-based component which acts to prevent the normal inhibition that organic compounds effect in the presence of cement to retard its hydration. The morphology of the cement crystals is altered by Chloranan, turning these into flat, thick platelets with five time the surface area of normal cement crystals. The additional surface area provides more sites for chemical bonding of the insoluble metal hydroxide compounds and residual organic compounds, which are then microencapsulated by subsequent crystal growth.

Processing Equipment

The stabilization process was performed with a portable concrete mixer having a capacity of 1/3 cubic yard. Batches were processed by adding the contaminated soil and Portland cement, mixing briefly, then adding chloranan and water, and mixing for 10 to 15 minutes. Upon completion of the mixing cycle, the treated soil was discharged onto a concrete pad lined with 6-mil visqueen and allowed to cure. Once curing was complete, samples of the treated soil were collected and analyzed for copper, nickel, lead, and zinc.

VI. LICENSES AND PERMITS

ATTACHMENTS

VI-A. Dublin San Ramon Services District - Revised Wastewater Discharge

VI-B. CKC, Inc - Contractor's License and Hazardous Substances Certification

Additional permit requirements for
Dublin Multilayer during the batch
discharge phase of the fire clean-up
operation: February 26 to March 23, 1990.

---

1. All permit limitations stated in the current discharge permit (#3672-101) as well as all applicable limits and conditions for discharge stated in the District Code shall be followed at all times.

2. The District shall be notified immediately of any change in operation, a spill, leak, or other problem which may, in any way, affect the collection system or sewage treatment plant. The number is 846-4565 and the telephone is manned 24 hours per day.

3. Discharge of batch loads to the sewer is permitted only after laboratory testing is completed and results are submitted to the District for approval from a State of California certified laboratory. Permission to dump each load shall be obtained from the District staff prior to commencing.

4. Split samples shall be collected and documented by District staff on initial and follow-up samples prior to sending those samples to an outside laboratory for testing.

5. The District shall be notified at least two hours before each batch discharge is to take place. No discharge shall be allowed until an inspection of the site and pumping operation is completed by District staff.

6. Batch discharges shall be allowed in increments not to exceed 6,000 gallons per day. Discharge of the batch shall be spread over the course of an 6 hour day (minimum), or at a rate of 1,000 gallons per hour or 20 gallons per minute.

7. The District will grab a sample of the discharge effluent 4 to 6 hours into (or sometime past the mid-point of) the pumping operation.

8. At a minimum, metals to be tested for and reported to the District will include: Copper, Chromium, Lead, Nickel, and Zinc. In addition, all batches shall be tested for Cyanide.
