Subject: Report of Quarterly Groundwater Monitoring for July 1 to September 30, 1996, The Sherwin-Williams Plant, Emeryville, California

Dear Mr. Arigala:

The enclosed report presents the results of the quarterly groundwater monitoring program conducted in July and August 1996 for the Sherwin-Williams plant in Emeryville, California. This is the second groundwater monitoring event conducted following completion of interim remedial measures activities and recent installation of additional site monitoring wells.

The quarterly monitoring program included measuring groundwater elevations and collecting and analyzing groundwater samples. The samples were analyzed for volatile organic compounds using EPA Method 8240, total petroleum hydrocarbon compounds as diesel using EPA Method 3510, total petroleum hydrocarbon compounds as gasoline using EPA Method 5030, and arsenic using EPA Method 200/6000/7000 Series.

In addition, groundwater was collected from four A-zone and four B-zone monitoring wells, and was analyzed for general minerals and oxygen and hydrogen isotopes. Evaluation of this data will help assess the degree of mixing of water between the A-zone and the B-zone at the Site. If you have any questions or comments, please call either of the undersigned or Mike Marsden at (510) 652-4500.

Sincerely,

Mark D. Knox

1.0 INTRODUCTION AND SCOPE

This quarterly groundwater monitoring report for July 1 to September 30, 1996 has been prepared for The Sherwin-Williams Company for submittal to the Regional Water Quality Control Board (RWQCB) as part of a self-monitoring program for its manufacturing facility located at 1450 Sherwin Avenue, Emeryville, California ("the Site"; Figures 1 and 2). This report describes the second monitoring event following completion of the site remedial construction activities and installation of the new monitoring wells.

The quarterly groundwater monitoring for July 1 to September 30, 1996, was conducted in July and August 1996. The quarterly monitoring activities conducted this quarter included the following:

- Groundwater levels were measured in on- and off-site monitoring wells (LF-3, LF-7, LF-8, LF-10, LF-11, LF-12, LF-13, LF-17, LF-18, LF-19, LF-20, LF-21, LF-22, LF-23, LF-24, LF-25, LF-26, LF-B3, LF-B4, LF-B-5, LF-B6, EX-1, EX-2, EX-3, and Rifkin Property wells RP-1 through RP-5 and MW-1 through MW-5).
- Groundwater samples were collected from ten A-zone monitoring wells located outside the site slurry wall, three A-zone monitoring wells located inside the slurry wall, the three extraction wells located inside the site slurry wall, and all four B-zone monitoring wells.
- Groundwater samples collected from the ten A-zone monitoring wells located outside the site slurry wall, the three extraction wells located inside the site slurry wall, and all four B-zone monitoring wells were analyzed for volatile organic compounds (VOCs) using EPA Method 8240, for total petroleum hydrocarbons as diesel (TPHd) using EPA Extraction Method 3510, for total petroleum hydrocarbons as gasoline (TPHg) using EPA Extraction Method 5030, and for inorganic compounds as arsenic using EPA Method 7060.
- Groundwater samples collected from one of the A-zone monitoring wells located outside the site slurry wall (LF-12), three A-zone monitoring wells located inside the slurry wall (LF-7, LF-10, and LF-22), and the four B-zone monitoring wells were analyzed for general minerals using EPA Method 3010, and for oxygen and hydrogen isotope analysis using an automated gas-source mass spectrometer.

Data were collected and reported in accordance with the guidelines set forth in the Quality Assurance Project Plan (QAPP) prepared for this project by Levine·Fricke·Recon (Levine·Fricke·Recon 1990a).

2.0 GROUNDWATER ELEVATIONS AND FLOW DIRECTIONS

Groundwater elevations were measured on July 29, 1996. Groundwater elevation data are presented in Table 1. Elevations and directions of groundwater flow in the A zone and the B zone are illustrated in Figures 3 and 4, respectively.

As shown in Figure 3, groundwater flow in the A zone is being affected by pumping extraction wells EX-1, EX-2, and EX-3 within the site slurry wall. The A-zone groundwater flow direction inside the slurry wall is generally toward each of the three extraction wells. The A-zone groundwater flow direction outside the slurry wall is generally toward the northwest with flow directions, changing slightly at and near the slurry wall.

The A-zone groundwater flow direction outside the slurry wall is generally consistent with historical A-zone groundwater flow directions. The A-zone groundwater flow direction inside the slurry wall indicates that A-zone groundwater within the slurry wall is being captured and prevented from moving off site.

As shown in Figure 4, B-zone groundwater flow direction is to the northwest. This is consistent with B-zone groundwater flow directions previously reported for the Site.

3.0 GROUNDWATER QUALITY SAMPLING

Levine·Fricke·Recon personnel collected groundwater samples for chemical analysis from July 30 to August 2, 1996, from A-zone monitoring wells LF-3, LF-11, LF-12, LF-13, LF-18, LF-20, LF-21, LF-23, LF-24, and LF-25, A-zone extraction wells EX-1, EX-2, and EX-3, and B-zone monitoring wells LF-B3 to LF-B6.

A minimum of 3 well volumes of water was purged from each monitoring well before sampling. The wells were purged either by pumping with a centrifugal pump or by hand bailing with a disposable polyethylene bailer. Wells that recovered slowly were purged dry and allowed to recover to 80 percent of the initial well volume before they were sampled. The hoses attached to the centrifugal pump were steam cleaned before each use. The evacuated water was pumped into a portable storage tank and then transferred and discharged into the site groundwater treatment system. Field measurements of temperature, pH, and specific conductance of the evacuated water were recorded during purging; wells were sampled after these parameters had stabilized.

After each well had been purged, groundwater samples were collected from monitoring wells for laboratory analysis using a new disposable, polyethylene bailer for each well. Groundwater samples collected from extraction wells were collected at discharge ports at the site treatment system. All samples for chemical analysis were analyzed by American Environmental Network of Pleasant Hill, California, a state-certified

laboratory, according to EPA Method protocols. Laboratory certificates are included in Appendix A.

4.0 GROUNDWATER QUALITY ANALYSIS RESULTS

4.1 A-Zone Water Quality

Analytical results for samples collected from A-zone monitoring wells are presented in Table 2 for VOCs, Table 3 for TPHd and TPHg, and Table 4 for inorganic compounds. Graphic illustrations of chemical concentrations detected in A-zone wells are presented in Figure 5 for VOCs, Figure 6 for TPHd, Figure 7 for TPHg, and Figure 8 for concentrations of arsenic.

4.1.1 Volatile Organic Compounds

VOC analytical results for samples collected from A-zone wells, outside the slurry wall during this sampling event, were below the reported laboratory detection limits with the exception of the sample from well LF-3. Groundwater collected from well LF-3 contained 4.5 parts per million (ppm) ethylbenzene, 24.0 ppm total xylenes, and 44.0 ppm toluene.

4.1.2 Total Petroleum Hydrocarbons as Diesel

Relatively low hydrocarbon concentrations of TPHd (5.6 ppm or less) were detected in samples from A-zone wells located outside the slurry wall (see Table 3, Figure 6, and Appendix A). TPHd concentrations for wells LF-12 and LF-13 did not exceed the detection limit of 0.050 ppm.

4.1.3 Total Petroleum Hydrocarbons as Gasoline

With the exception of wells LF-3, LF-20, and LF-21, concentrations of TPHg did not exceed the detection limit of 0.050 ppm in samples from A-zone wells located outside the slurry wall (see Table 3, Figure 7, and Appendix A). Samples collected from wells LF-20 and LF-21 contained the relatively low TPHg concentrations at 0.20 and 0.060 ppm, respectively. A sample collected from well LF-3 contained 90 ppm TPHg.

4.1.4 Inorganic Compounds as Arsenic

Analytical results for samples collected from A-zone wells, located outside the slurry wall were analyzed for inorganic compounds as arsenic. Concentrations of arsenic were detected in seven wells.

With the exception of well LF-3, concentrations ranged from 0.006 ppm in well LF-12 to 0.43 ppm in well LF-21. The sample from well LF-3 contained 72 ppm arsenic. Analytical results of arsenic in samples collected from wells LF-23 and LF-24 can not be validated because of possible field blank cross contamination as described in Section 5.0.

4.2 B-Zone Water Quality

Analytical results for samples collected from B-zone monitoring wells are presented in Table 2 for VOCs, Table 3 for TPHd and TPHg, and Table 4 for inorganic compounds. Graphic illustrations of chemical concentrations detected in B-zone wells are presented in Figure 6 for TPHd, Figure 7 for TPHg, Figure 9 for VOCs, and Figure 10 for inorganic compounds as arsenic.

4.2.1 Volatile Organic Compounds

VOC analytical results for samples collected from B-zone wells LF-B3, LF-B4, LF-B5, and LF-B6 are presented in Table 2. 1,2-dichloroethane (1,2-DCA) was detected in wells LF-B3, LF-B5, and LF-B6 at 0.022, 0.38, and 0.030 ppm, respectively. In addition, the sample from well LF-B6 contained 0.110 ppm ethylbenzene. The concentrations of VOCs in the sample collected from well LF-B4 did not exceed the laboratory detection limits.

4.2.2 Total Petroleum Hydrocarbons as Diesel

The TPHd analytical results from samples collected from B-zone wells LF-B3 and LF-B6 indicated concentrations of diesel of 0.60 and 0.080 ppm, respectively. The concentrations of TPHd in the samples collected from wells LF-B4 and LF-B5 did not exceed the laboratory detection limit (Table 3, Figure 6, and Appendix A).

4.2.3 Total Petroleum Hydrocarbons as Gasoline

The TPHg analytical results from samples collected from B-zone wells LF-B5 and LF-B6 indicated diesel concentrations of 0.15 and 0.38 ppm, respectively. The concentrations of TPHd in the samples collected from wells LF-B3 and LF-B4 did not exceed the laboratory detection limit (Table 3, Figure 7, and Appendix A).

4.2.4 Inorganic Compounds as Arsenic

Arsenic was detected in samples collected from wells LF-B3, LF-B5, and LF-B6 at concentrations of 0.004, 0.097, and 0.033 ppm, respectively. The concentrations of arsenic in groundwater collected from these three wells have decreased significantly (an order of magnitude scale) from concentrations detected in the previous monitoring

period. The concentrations of arsenic in the sample collected from well LF-B4 did not exceed the laboratory detection limit.

5.0 GEOCHEMICAL ANALYSIS OF GROUNDWATER COLLECTED FROM FOUR A-ZONE AND FOUR B-ZONE WELLS

To evaluate the degree of mixing of water between the A- and the B-zone at the Site, additional analyses of selected groundwater samples were conducted during this quarterly monitoring event. The additional analyses for general minerals and stable isotopes were performed on groundwater samples collected from A-zone wells LF-7, LF-10, LF-12, and LF-22 and B-zone wells LF-B3, LF-B4, LF-B5, and LF-B6. General minerals were analyzed for using EPA Method 3010, and oxygen and hydrogen isotopes were analyzed for using an automated gas-source mass spectrometer.

Samples for general minerals analysis were analyzed by American Environmental Network of Pleasant Hill, California, a state-certified laboratory, according to EPA Method protocols. Samples for stable isotopes were analyzed by Isotope Solutions of Berkeley, California at the Center for Isotope Geochemistry at the Berkeley Laboratory.

Laboratory certificates for general minerals analyses are included in Appendix A. A report prepared by Isotope Solutions presenting the stable isotope analysis results and a discussion of stable isotope as an analytical tool are included in Appendix B.

5.1 General Minerals Analysis Results

Results of general minerals analysis are currently inconclusive. Because of omissions in the laboratory analytical report, an evaluation of the general minerals analytical results can not be completed. The samples will be analyzed for general minerals during the next quarterly sampling event and re-evaluated at that time.

5.2 Stable Isotope Ratio Analysis Results

Results from the stable isotope analyses indicate that the total ranges of oxygen and hydrogen isotope ratios are overlapping between the A- and B-zone samples. Differences include A-zone samples indicate slightly lower values of oxygen and hydrogen isotope ratios than B-zone samples. Also, the range of oxygen isotope ratios at the Site is larger than would be expected at a relatively small site with low relief.

The relatively large ranges of isotope ratio values suggest there is some fluid mixing at the Site, possibly with an outside source such as East Bay Municipal Utilities District water. Additionally, mixing of water between the A- and B-zone is possible based on the overlapping data (Appendix B).

6.0 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC) PROCEDURES AND RESULTS

QA and QC measures were implemented for the purpose of maintaining data quality and minimizing the potential for field and/or laboratory cross contamination of samples. QA/QC procedures included collecting trip blank and bailer rinsate blank samples, controlling sampling order, using disposable bailers, and daily steam cleaning of pump hoses before and after use.

The results for the QA/QC samples are reported in Appendix A and in Tables 2 through 4. With the exception of the results for the field blank collected at well LF-24, these results indicate that the QA/QC controls were effective in eliminating field and/or laboratory cross contamination of samples.

The field blank collected at well LF-24 contained 0.004 ppm arsenic. Because arsenic is a low probability laboratory contaminant, the contamination in the field blank collected at well LF-24 may be caused by cross contamination in the field. Therefore, the presence of arsenic in samples collected from wells LF-23 and LF-24 may be caused by field contamination and can not be validated.

Data entered by_____. Data proofed by TAC QA/QC by SXS

Notes:

DUP = Duplicate Sample

1,1,1-TCA = 1,1,1-Trichloroethane

1,2-DCA = 1,2-Dichloroethane

PCE = Tetrachloroethene

TCE = Trichloroethene

#1 LF-B3 6/02/89 - Vinyl Acetate reported at 0.001 ppm, Styrene reported at 0.001 ppm, and Methyl Isobutyl Ketone reported at 0.001 ppm.

#2 LF-1 7/20/90 - cis-Dichloroethene reported at 0.001 ppm.

#3 LF-13 12/19/90 - 1,1-Dichloroethane reported at 0.002 ppm.

#4 LF-4 DUP 06/21/91 - cis-1,2-Dichloroethene reported at 0.020 ppm.

Data entered by_____. Data proofed by KAC QA/QC by SKS

Notes:

Samples analyzed by B&C using Modified EPA Method 8015 for total fuel hydrocarbons.
Samples analyzed by ANA and AEN using EPA Method 3510 for total petroleum hydrocarbons as diesel.
Samples analyzed using EPA Method 5030 for total petroleum hydrocarbons as gasoline

#1 - The concentrations reported as diesel by Anametrix for samples LF-10, LF-10DUP, LF-11, and LF-14 are primarily caused by the presence of a heavier petroleum product, possibly motor oil.
#2 - The concentrations reported as diesel by Anametrix for samples LF-3, LF-3DUP, LF-4, and LF-5 are primarily due to the presence of a lighter petroleum product of hydrocarbon range C6-C12, possibly gasoline.
#3 - The concentrations reported as gasoline by Anametrix for samples LF-B1, LF-B2 and LF-B4 are primarily caused by the presence of discrete hydrocarbon peak not indicative of gasoline.
#4 - The concentration reported by Anametrix as gasoline for samples LF-8 and LF-9 are primarily caused by the presence of a heavier petroleum hydrocarbon peak not indicative of gasoline.

Data entered by _____. Proofed by _____.

Notes :

* = Data not validated based on positive results of trip blank (0.014 ppm) or bailer rinsate blank (0.013 ppm) of submitted samples. Detection Limit for arsenic for December 1989 sampling period set at 0.070 or 5 times the reported value of 0.014 ppm for trip blank sample.

** = Data not validatd based on positive results of bailer rinstate blank (0.004 ppm) of submitted samples.

NA = Not Analyzed

200/7000 = EPA Method 200/6000/7000 Series for selected metals.

Results of analyses for other inorganic compounds as metals that are not part of the annual and semiannual self-monitoring program for 1992 and 1993 are reported in Levine*Fricke, April 4, 1990, Table 10 and Levine*Fricke, December 20, 1991, Table 5.

CLIENT PROJ. NAME: SHERWIN WMS
C.O.C. NUMBER: 15067

REPORT DATE: 08/15/96
DATE(S) SAMPLED: 08/02/96
DATE RECEIVED: 08/02/96
AEN WORK ORDER: 9608029

PROJECT SUMMARY:

On August 2, 1996, this laboratory received 4 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9608029

CLIENT PROJECT ID: 3435.00.04

Quality Control Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

PROJECT SUMMARY:

On July 30, 1996, this laboratory received 3 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9607403

CLIENT PROJECT ID: 3435.00.04

Quality Control Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

DATE RECEIVED: 07/30/96
AEN WORK ORDER: 9607403

PROJECT SUMMARY:

On July 30, 1996, this laboratory received 3 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9607403

CLIENT PROJECT ID: 3435.00.04

Quality Control Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

AEN WORK ORDER: 9608014

PROJECT SUMMARY:

On August 1, 1996, this laboratory received 5 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9608014

CLIENT PROJECT ID: 3435.00.04

Quality Control Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

CLIENT PROJ. NAME: SHERWIN WMS.
C.O.C. NUMBER: 15040

REPORT DATE: 08/13/96
DATE(S) SAMPLED: 07/31/96
DATE RECEIVED: 07/31/96
AEN WORK ORDER: 9607414

PROJECT SUMMARY:

On July 31, 1996, this laboratory received 3 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

Larry Klein
Laboratory Director

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9607414

CLIENT PROJECT ID: 3435.00.04

Quality Control Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

DATE RECEIVED: 08/01/96
AEN WORK ORDER: 9608015

PROJECT SUMMARY:

On August 1, 1996, this laboratory received 4 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9608015

CLIENT PROJECT ID: 3435.00.04

Quality Control Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

PROJECT SUMMARY:

On July 30, 1996, this laboratory received 3 water sample(s).

Client requested sample(s) be analyzed for chemical parameters. Results of analysis are summarized on the following page(s). Please see quality control report for a summary of QC data pertaining to this project.

Samples will be stored for 30 days after completion of analysis, then disposed of in accordance with State and Federal regulations. Samples may be archived by prior arrangement.

If you have any questions, please contact Client Services at (510) 930-9090.

AEN (CALIFORNIA)
QUALITY CONTROL REPORT

AEN JOB NUMBER: 9607404

CLIENT PROJECT ID: 3435.00.04

Quality Control Summary

All laboratory quality control parameters were found to be within established limits.

Definitions

Laboratory Control Sample (LCS)/Method Spike(s): Control samples of known composition. LCS and Method Spike data are used to validate batch analytical results.

Matrix Spike(s): Aliquot of a sample (aqueous or solid) with added quantities of specific compounds and subjected to the entire analytical procedure. Matrix spike and matrix spike duplicate QC data are advisory.

Method Blank: An analytical control consisting of all reagents, internal standards, and surrogate standards carried through the entire analytical process. Used to monitor laboratory background and reagent contamination.

Not Detected (ND): Not detected at or above the reporting limit.

Relative Percent Difference (RPD): An indication of method precision based on duplicate analysis.

Reporting Limit (RL): The lowest concentration routinely determined during laboratory operations. The RL is generally 1 to 10 times the Method Detection Limit (MDL). Reporting limits are matrix, method, and analyte dependent and take into account any dilutions performed as part of the analysis.

Surrogates: Organic compounds which are similar to analytes of interest in chemical behavior, but are not found in environmental samples. Surrogates are added to all blanks, calibration and check standards, samples, and spiked samples. Surrogate recovery is monitored as an indication of acceptable sample preparation and instrumental performance.

D: Surrogates diluted out.

#: Indicates result outside of established laboratory QC limits.

ISOTOPE SOLUTIONS' REPORT ON A INITIAL STABLE ISOTOPE INVESTIGATION

ISOTOPE SOLUTIONS

1126 Deleware St., Berkeley, CA 94702
(510) 527-7237

Michael Marsden
Levine-Fricke
1900 Powell St., 12th Floor
Emeryville, CA 94608

September 14, 1996

Mr. Marsden,

We are pleased to enclose the final report for the initial investigation of stable isotopic compositions of eight groundwater samples from the Sherman Williams site, Emeryville, CA. Also enclosed is an invoice for the analytical work and enclosed report.

We are pleased that you have chosen ISOTOPE SOLUTIONS to support this project. Please feel free to call us if you have any questions concerning the data and interpretations in the enclosed report. We are eager to provide you with continuing support in the use of geochemical and isotopic information in this or other environmental or ecological investigations handled by your firm.

Sincerely,

Dr. Leticia B. Menchaca
Isotope Solutions

Initial Stable Isotopic Investigation of the Sherman Williams Site, Emeryville, CA

Introduction

Natural waters from differing sources have distinctive stable isotopic compositions ($^{18}O/^{16}O$ and $^{2}H/^{1}H$ or D/H ratios), as expressed by their $\delta^{18}O$ and δD values (Epstein and Mayeda, 1953; Friedman, 1953). The stable isotopic compositions are characteristics of the water molecules themselves; they are inherent tracers that allow waters of differing origins to be identified and distinguished from one another (e.g., Mazor, 1991).

This report presents the results of oxygen and hydrogen isotope analyses of eight groundwater samples from the Sherman Williams site, Emeryville, CA. The analyses were conducted as a preliminary survey to determine if stable isotopic compositions of groundwater samples taken from the shallow subsurface (Upper zone) are distinctive from those of groundwater samples taken from deeper portions (Lower zone) of the site. The data may also contribute information on the origin(s) of the groundwaters and on the degree to which the Upper and Lower zones are isolated from one another.

Stable isotopic contrast would be expected if the waters of the two sampled zones are of differing age and/or origin. The stable isotopic results may also provide information on the degree of mixing (if any) between groundwaters from the two zones, especially in any areas where geochemical results may indicate the possibility of vertical communication.

Finally, the stable isotope data are useful in determining the potential for possible active stable isotope tracer studies at the site, to determine the directions and velocities of infiltration and subsurface water flow in areas of particular interest or sensitivity. In such tests, pure water with a differing stable isotopic composition can be used as the tracer fluid with no potential damage to the environment. Such environmentally innocuous tracers are particularly applicable to ecologically sensitive sites, such as wetlands or other sites near surfaces water bodies.

Analytical Methods

Oxygen isotope ($^{18}O/^{16}O$) and hydrogen isotope ($^{2}H/^{1}H$, or D/H) ratios were measured on an automated gas-source mass spectrometer at the Center for Isotope Geochemistry at the Berkeley Laboratory. At this laboratory, water samples for O-isotope analysis are inlet directly into an automated, computer driven gas equilibration system attached to the mass spectrometer. Hydrogen gas samples are prepared for D/H ratio analysis using conventional reduction methods over zinc in closed tubes. The hydrogen gas is inlet to the mass spectrometer through an automated inlet system. Analytical reports are automatically printed and electronically filed in the mass spectrometer computer system.

All stable isotopic data are reported using delta (δ) notation, expressing parts per thousand (‰ or per mil) differences between the isotope ratio of the sample and that of the standard, V-SMOW (Craig, 1961):

$$\delta^{18}O \text{ or } \delta D = ((R_S - R_{V\text{-}SMOW})/R_{V\text{-}SMOW}) \times 1000, \text{ where}$$

$$R = {}^{18}O/{}^{16}O \text{ or } D/H,$$

$$s = \text{sample, and}$$

$$V\text{-}SMOW = \text{Vienna Standard Mean Ocean Water.}$$

Typical analytical uncertainties (standard deviations from the mean) in the $\delta^{18}O$ and δD values of water samples using the methods and instrumentation described above are ±0.1 and 1.0 ‰, respectively at the 2σ (95%) confidence level.

Completion of Data Quality Objectives

All DQOs for this project, including goals covering completeness, precision, accuracy and QA/QC appear to have been fully satisfied.

Results

The $\delta^{18}O$ and δD values of the eight submitted water samples are shown on Table 1, below.

Table 1. Oxygen and hydrogen isotope data, Sherman Williams site, Emeryville, CA.

	Sample Number	$\delta^{18}O$ (‰)	δD (‰)
Lower Zone	LF-B3	-5.3	-32
	LF-B4	-6.2	-36
	LF-B5	-7.7	-51
	LF-B6	-6.6	-43
Upper Zone	LF-7	-6.3	-38
	LF-10	-7.3	-49
	LF-12	-7.8	-55
	LF-22	-8.0	-55

Discussion

The stable isotopic data for Sherman Williams site waters are plotted on a convention Meteoric Water Diagram on Figure 1, where the heavy dark line is the Global Meteoric Water Line, defined by the equation (Craig, 1961):

$$\delta D = 8\delta^{18}O + 10$$

Essentially all natural waters that have been recently equilibrated with the atmosphere fall on or near this line, unless the waters have been partly evaporated (Craig, 1961). The fact that the data for the Sherman Williams site fall along the Meteoric Water Line shows that they suffered little or no evaporated prior to infiltration. Because $\delta^{18}O$ and δD values of the samples are linearly related, the following discussion will focus only on the $\delta^{18}O$ values.

Origin(s) of the Groundwaters

The $\delta^{18}O$ values provide information on the likely origin(s) of groundwaters analyzed in this investigation. The total ranges in $\delta^{18}O$ (-5.3 to -8.0 ‰) and δD (-32 to -55 ‰) for the eight Emeryville site samples are not unusual for relatively shallow (less than 50 meters depth) groundwaters in the East Bay area. To illustrate this fact, it is useful to compare the Sherman Williams site results with results for the Ernest Orlando Lawrence Berkeley National Laboratory (Berkeley Lab), located approximately 5 km to the ENE and at a slightly higher average elevation (~250 m) than the Emeryville site (Smith et al., 1993).

Shallow groundwaters at Berkeley Lab have $\delta^{18}O$ values that range from -6 ‰ to -7 ‰ in most areas, as would be expected at a site where the mean annual rainfall has a $\delta^{18}O$ value of -5.8 ± 0.1 ‰ (Smith, et al., 1993). Where Berkeley Lab waters have been mixed with facility waters delivered from the East Bay Municipal Utilities District (EBMUD; $\delta^{18}O$ = -12 ‰), the $\delta^{18}O$ values are lower (more negative) , ranging down to values below -10 ‰ in one area. At Berkeley Lab, the lowest $\delta^{18}O$ values occur along inactive faults and near areas of leaking facility water lines and broken sanitary sewers. Infiltration of small amounts of surface irrigation waters may also contribute to slightly lower $\delta^{18}O$ values in some areas. Several particularly ^{18}O-rich shallow groundwater samples at Berkeley Lab (ranging up to $\delta^{18}O$ = -5 ‰) are probably the result of infiltration of some partly evaporated water from nearby cooling towers.

The most ^{18}O-rich Emeryville site water (Sample LF-B3; $\delta^{18}O$ = -5.3 ‰) is slightly "heavier" than the most ^{18}O-rich (non-evaporated) groundwaters from the Berkeley Lab ($\delta^{18}O$ ~ -6 ‰). The 0.7 ‰ difference is consistent with the ~250 meter lower average elevation of the Emeryville site. Higher elevation and lower temperatures cause precipitation to be depleted in ^{18}O, due to the temperature dependence of stable isotopic fractionation during condensation (see Mazor, 1991).

The most ^{18}O-rich Emeryville site water (Sample LF-B3; $\delta^{18}O$ = -5.3 ‰) is also isotopically similar to the average annual rainfall in the area, as determined for 1992 Berkeley precipitation (Smith, et al., 1993). The stable isotopic data suggest that the Sherman Williams groundwaters do not contain a significant component of San Francisco Bay water ($\delta^{18}O$ estimated to be ~ -2 ‰ near the Emeryville site). This conclusion could be further verified with geochemical information for the samples.

Stable Isotopic Distinctions between the Upper and Lower Zones

Four of the eight samples analyzed are from the Upper zone at the Emeryville site (Samples 7, 10, 12, and 22), while the remaining four samples were taken from a Lower zone (Samples B3 through B6). Figure 1 shows the following:

- The total ranges in $\delta^{18}O$ and δD are overlapping for the two sampled groups.
- Upper zone samples range to slightly lower values ($\delta^{18}O$ = -8.0 ‰) than Lower zone samples ($\delta^{18}O$ = - 7.7 ‰).
- Lower zone samples (filled squares) range to higher $\delta^{18}O$ values ($\delta^{18}O$ = -5.3 ‰) than Upper zone samples ($\delta^{18}O$ = -6.3 ‰).
- One Lower zone sample plots with three Upper Zone samples and, conversely, one Upper zone sample plots near three Lower Zone samples.

Stable Isotopic Ranges

The isotopically "lightest", most ^{18}O-poor sample (LF-22) has a $\delta^{18}O$ value of -8.0 ‰, 2.7 ‰ lower than the most ^{18}O-rich sample. This range is somewhat larger than would be expected for a relatively small site with low relief, suggesting:

- mixing of two or more isotopically distinct waters (i.e., groundwater with $\delta^{18}O$ ~ -6 ‰ and EBMUD water with $\delta^{18}O$ ~ -12 ‰), or
- the existence of more than 1 isolated or partially isolated zones, each with a smaller overall range in $\delta^{18}O$. Note that the four samples from the Lower zone show almost the entire range of $\delta^{18}O$ demonstrated by all eight samples, implying the likelihood of some mixing with low-^{18}O waters even within this zone.

Conclusions

The initial stable isotopic evaluation of eight groundwater samples from the Upper and Lower zones at the Sherman Williams site in Emeryville, CA, indicate the following:

- The stable isotopic compositions of the groundwaters are similar to those at other East Bay sites, when corrected for elevation differences.
- The most ^{18}O-rich groundwaters are isotopically similar to mean annual rainfall in Berkeley, suggesting a dominant local rain water origin.
- The relatively large ranges in $\delta^{18}O$ and δD values suggest that there is some fluid mixing at the site, perhaps involving EBMUD water.
- The possibility of mixing of waters between the Upper and Lower zones can not be ruled out solely on the basis of the stable isotopic data.

Recommendations

If more information is desired, we recommend that follow-up investigations be conducted to further investigate the waters from the Upper and Lower zones. For example, water from the Lower zones of wells that delivered samples B3 and B5 and from the Upper zones of wells that delivered samples LF-7 and LF-22 might be resampled for stable isotopic and low level tritium analysis, as well as inorganic cations and anions. These samples represent the most extreme stable isotopic compositions measured in this initial investigation*.

The combination of these data are more likely to allow a more diagnostic interpretation of the extent to which the Upper and Lower zones are isolated from one another, as well as the extent of any mixing of San Francisco Bay water with groundwaters at the Emeryville site.

Isotope Solutions would be pleased to further discuss the data and interpretations contained in this report, as well as various additional geochemical and isotopic approaches that may provide further information on the hydrogeology of this site.

*Note that the pattern of stable isotopic data shown on Figure 1 might also be explained if the Upper and Lower zones had quite distinctive stable isotopic compositions, but two of the samples (numbers B5 and 7) had been inadvertently switched during sample collection. It is recommended that these two wells be resampled and reanalyzed to investigate this possibility.

ISOTOPE SOLUTIONS

Invoice for Sherman Williams Stable Isotope Investigation

Analytical and Sample Handling ($^{18}O/^{16}O$ and D/H, 8 samples)	$1,200.00
Interpreting and Reporting	800.00
Miscellaneous Operating Expenses	100.00
Total Cost	$2,100.00

Full payment to Isotope Solutions is due within 15 calendar days of the date of receipt of the enclosed interpretive report for this investigation.

Please make check payable to ISOTOPE SOLUTION at:

1126 Delaware Street
Berkeley, CA 94702

ISOTOPE SOLUTIONS is a minority owned, small business registered in Alameda County, CA.
