Subject: Quarterly Self-Monitoring Report, July 1 to September 30, 1999, Site Cleanup Requirements (SCR) Order No. 98-009, The Sherwin-Williams Company, Emeryville, California

Dear Mr. Johnson:

Enclosed is the self-monitoring report, prepared by LFR Levine·Fricke (LFR) on behalf of The Sherwin-Williams Company, for the quarterly period of July 1 through September 30, 1999. This self-monitoring report is submitted pursuant to the requirements of SCR Order No. 98-009, issued by the Regional Water Quality Control Board on February 19, 1998. Self-monitoring activities conducted at The Sherwin-Williams Company site in Emeryville, California ("the Site") during this quarterly reporting period were in compliance with requirements of the SCR and self-monitoring program.

This report presents historical data and the results of the quarterly groundwater monitoring program conducted at the Site in July 1999. In addition, this report includes summaries of the operation of the Sherwin-Williams groundwater extraction and treatment systems and information about removal of contaminants from extracted groundwater at the Site, as required by the SCR.

I certify, under penalty of perjury, that this document and all attachments are prepared under my direction or supervision and the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

If you have any questions or comments regarding this report, please call Larry Mencin at (216) 566-1768 or me at (510) 652-4500.

Sincerely,

(original, signed letter filed with the Regional Water Quality Control Board)
Michael B. Marsden, R.G., C.HG.

1.0 INTRODUCTION AND SCOPE

LFR Levine·Fricke (LFR) prepared this quarterly groundwater monitoring report for the period of July 1 through September 30, 1999, on behalf of The Sherwin-Williams Company, as part of a self-monitoring program for the manufacturing facility located at 1450 Sherwin Avenue in Emeryville, California ("the Site"; Figures 1 and 2).

This quarterly report is submitted in accordance with the self-monitoring requirements specified in Site Cleanup Requirements (SCR) Order No. 98-009, issued to The Sherwin-Williams Company by the California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB) on February 19, 1998 (RWQCB 1998).

In July 1999, LFR conducted the following groundwater monitoring activities for this quarter:

- Groundwater elevations were measured in 53 on- and off-site monitoring wells (LF-3, LF-4, LF-7, LF-8, LF-10 through LF-13, LF-17 through LF-34, LF-B3 through LF-B6, EX-1 through EX-13, RP-1 through RP-5, and MW-1 through MW-5), 22 on-site piezometers (LFPZ-1 through LFPZ-22), and 3 off-site piezometers (LFPZ-23 through LFPZ-25).
- Groundwater samples were collected at the Site from 27 A-zone monitoring wells located outside the site slurry wall, 3 A-zone extraction wells located outside the site slurry wall, 4 A-zone monitoring wells located inside the site slurry wall, 10 A-zone extraction wells located inside the site slurry wall, and 4 B-zone monitoring wells. The samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8260; total petroleum hydrocarbon (TPH) as diesel (TPHd) using EPA Extraction Method 3510; TPH as gasoline (TPHg) using EPA Extraction Method 5030; and dissolved arsenic using EPA Method 7060.

Extraction wells EX-11, EX-12, and EX13; monitoring wells LF-31 through LF-34; and piezometers LFPZ-21 through LFPZ-25 were installed in June 1999. Data from these monitoring points are presented in this report for the first time.

This report also presents data on groundwater extraction and removal of contaminants from groundwater at the Site, as required by SCR Order No. 98-009.

2.0 GROUNDWATER GRADIENT AND POTENTIAL DIFFERENCES

Groundwater elevations were measured in extraction wells, monitoring wells, and piezometers on July 12, 1999. Groundwater elevation data are presented in Table 1. Groundwater elevations in the A zone and the B zone are illustrated in Figures 3 and 4, respectively.

Between the previous quarter (as measured on April 16, 1999) and the current quarter (as measured on July 12, 1999), water levels decreased by an average of approximately 2.5 feet inside the slurry wall and approximately 1.2 feet outside the slurry wall. In the B zone, which is not laterally confined by the slurry wall, during the previous quarter, water levels decreased on average approximately 0.9 feet. The decrease in water levels observed inside and outside the slurry wall and in both groundwater zones is consistent with the dry months (April through November) and contrasts the increase in water levels observed during the wet months (December through March). Water levels have decreased at a greater rate inside the slurry wall because of groundwater extraction.

2.1 Horizontal Groundwater Gradient

A Zone (Outside Slurry Wall)

As shown in Figure 3, the A-zone groundwater gradient south of the slurry wall is generally 0.004 foot per foot toward the northwest (between wells LF-13 and LF-11). Gradients appear to change in isolated areas as a result of influence from the site slurry wall and Temescal Creek. West of the slurry wall and in the vicinity of Temescal Creek, the groundwater gradient is generally to the northwest.

A Zone (Inside Slurry Wall)

All 10 extraction wells located inside the slurry wall (EX-1 through EX-10) were operational at the time water levels were measured on July 12, 1999. Groundwater extraction has influenced groundwater elevations measured in the A zone inside the slurry wall. The groundwater gradient in the western portion of the area enclosed by the slurry wall is nearly flat with flow toward extraction wells EX-1, EX-2, and EX-4 through EX-6. The groundwater gradient is steeper in the southern portion of the area enclosed by the slurry wall and is generally toward the west and extraction wells EX-3 and EX-7 through EX-10. In the southeastern corner of the area enclosed by the slurry wall, there is a steep gradient away from the corner toward extraction well EX-3.

B Zone

As shown in Figure 4, the groundwater elevations in the two B-zone monitoring wells in the northwestern part of the Site (LF-B3 and LF-B6) are slightly lower than the groundwater elevations in the two B-zone monitoring wells in the southeastern part of the Site (LF-B4 and LF-B5). These elevations indicate that B-zone groundwater at the Site on July 12, 1999, generally flowed from the southeast to the northwest.

2.2 Groundwater Potential Differences Across the Slurry Wall

As indicated in Table 2, the horizontal groundwater potential across the slurry wall on July 12, 1999, was inward in all 11 well pairs that are located along the slurry wall. In other words, in all well pairs, the groundwater elevation of the well outside the slurry

wall is greater than the groundwater elevation of the adjacent well inside the slurry wall. The number of well pairs with an inward potential has increased from the 8 reported in the previous quarter (measured on April 16, 1999). The horizontal potential across the slurry wall measured this quarter contrasts with the groundwater potential difference measured on the first quarter of 1998, when all well pairs had an outward potential. This indicates that within the past year, the groundwater elevation inside the slurry wall has decreased more than the groundwater level outside the slurry wall. This decrease is likely associated with increased extraction volumes resulting from improvements to the groundwater treatment system (GWTS). The marked decrease in water levels inside the slurry wall is also an indication that the slurry wall is inhibiting the movement of A-zone groundwater out of the area enclosed by the slurry wall.

2.3 Groundwater Potential Differences Across the A/B Aquitard

As indicated in Table 3, the vertical groundwater potential difference across the A/B aquitard wall on July 12, 1999, was upward at three of the four A- and B-zone well pairs. The groundwater potential difference across the A/B aquitard in the remaining well pair (LF-12/LF-B4) was downward. This well pair is also upgradient from the Site and outside the slurry wall. The three well pairs with upward potential are inside the slurry wall, and this shows that the groundwater extraction system is lowering the groundwater elevations in the A zone inside the slurry wall. Last quarter, the vertical groundwater potential difference across the A/B aquitard was also upward in three well pairs. This is in contrast to the groundwater potential difference across the A/B aquitard measured in the first quarter of 1998, when all four well pairs showed downward or near zero potential. This indicates that within the past year, the groundwater potential in the A zone inside the slurry wall has decreased more than the groundwater potential in the B zone. Once again, this decrease is associated with increased extraction rates resulting from improvements to the GWTS. It is important to note that the vertical groundwater potential difference at the well pair of LFPZ-6/LF-B5 may not be representative because LF-B5 is screened in the A/B aquitard.

3.0 GROUNDWATER QUALITY SAMPLING

Groundwater samples were collected for chemical analysis from July 13 through 23, 1999. Groundwater samples were collected and analyzed from all the site extraction wells, A-zone monitoring wells, and B-zone monitoring wells required by the SCR, except for well MW-2. The water sample from well MW-2 was not analyzed during this sampling event because of the presence of light nonaqueous phase liquid (LNAPL).

A minimum of three well volumes of water was purged from each monitoring well before sampling. The wells were purged either by pumping with a centrifugal pump or by hand bailing with a disposable polyethylene bailer. Wells that recovered slowly were purged dry and allowed to recover to a minimum of 80 percent of the initial well volume (or after a maximum of two hours) before they were sampled. The hoses

attached to the centrifugal pump were cleaned with high-pressure hot water (steam cleaned) before each use. The evacuated water was pumped into a portable storage tank and then transferred and discharged into the GWTS. Field parameters (temperature, pH, and specific conductance of the evacuated water) were recorded during purging; wells were sampled after the parameters had stabilized.

After each well had been purged, a sample was collected from that monitoring well for laboratory analysis using a new, disposable polyethylene bailer. Samples from operational extraction wells were collected at discharge ports at the site treatment system. All work was conducted in compliance with the Quality Assurance Project Plan (ENTRIX 1998) and the Health and Safety Plan (LFR 1998) for the Site. The samples designated for chemical analysis were analyzed according to EPA Method protocol by Curtis and Tompkins, Ltd., a state-certified laboratory located in Berkeley, California. In accordance with the RWQCB's letter dated November 5, 1996, and SCR Order No. 98-009, analytical laboratory reports and chain-of-custody forms for these samples are not presented in this report. The data will be kept on file at LFR's Emeryville office. Appendix A includes a quality assurance/quality control (QA/QC) review of groundwater sampling and analytical results, and is provided in lieu of raw data such as field data sheets, laboratory data sheets, QA/QC data, and chain-of-custody forms.

4.0 GROUNDWATER QUALITY ANALYSIS RESULTS

Results of groundwater sample analyses are presented in Table 4 for VOCs, Table 5 for TPHd and TPHg, and Table 6 for inorganic compounds. Table 7 presents a summary of arsenic concentration trends interpreted using the Mann-Kendall statistical evaluation method. Field parameters collected during groundwater sampling, including pH, are presented in Table B-1 in Appendix B. A complete listing of laboratory results, including QA/QC data, is provided in Appendix C.

Figures 5a through 5d show concentrations of VOCs detected in A-zone groundwater, Figure 6 shows concentrations of VOCs detected in B-zone groundwater, Figure 7 shows concentrations of TPHd in A- and B-zone groundwater, Figure 8 shows concentrations of TPHg in A- and B-zone groundwater, Figure 9 shows concentrations of arsenic in A-zone groundwater, and Figure 10 shows concentrations of arsenic in B-zone groundwater.

4.1 Volatile Organic Compounds

The following sections present the analytical results for VOCs in samples collected from groundwater monitoring wells at and around the Site.

4.1.1 A Zone (Outside Slurry Wall)

Analytical results for groundwater samples collected from A-zone wells that are outside the slurry wall and downgradient from the Site (LF-3, LF-11, LF-18, LF-20, LF-21,

LF-23, LF-24, and LF-25 [excluding former Rifkin Property wells]) did not contain VOCs above the laboratory detection limits, with the exception of samples from wells LF-3 and LF-20 (Figures 5a through 5d). The sample collected from well LF-3 contained, ethylbenzene, toluene, and xylenes at concentrations of 4.1 parts per million (ppm), 56 ppm, and 20 ppm, respectively. The sample collected from well LF-20 contained 0.0039 ppm chlorobenzene.

The sample collected from the A-zone well (LF-13) that is outside the slurry wall and upgradient from the Site contained 0.0007 ppm 1,1,1-trichloroethane. In addition, the sample collected from well LF-12, which is upgradient from the Site and downgradient from the former Shell Development property, contained 0.0014 ppm tetrachloroethene (PCE) and 0.0011 ppm trichloroethene (TCE; Table 4).

Analytical results for samples collected during this sampling event from the former Rifkin Property and adjacent Horton Street A-zone wells (EX-11 through EX-13, RP-1 through RP-5, MW-1 through MW-5, LF-19, and LF-27 through LF-34) indicated that all 21 of former Rifkin property and adjacent Horton Street wells sampled this quarter contained concentrations of at least one VOC above laboratory detection limits (Figures 5a and 5b). The highest VOC concentrations were detected in well MW-5 and the greatest number of VOC contaminants were detected in wells LF-27 through LF-30. The sample from well MW-5 contained 130 ppm acetone, 65 ppm methyl ethyl ketone, 1.4 ppm ethylbenzene, 26 ppm 4-methyl-2-pentanone, 72 ppm toluene, and 6.6 ppm xylenes.

Wells LF-27 through LF-30, which are downgradient from the former Shell Development Property and upgradient from the former Rifkin Property (Figures 5a and 5b), contained one or more of the following compounds in concentrations above the detection limit: benzene, chlorobenzene, chloroform, 1,2-dichloroethene (1,2-DCE), cis-1,2-DCE, trans-1,2-DCE, 1,2-dichloropropane, PCE, 1,1-dichloroethane (1,1-DCA), 1,2-DCA, isopropylbenzene, methyl tertiary-butyl ether (MTBE), TCE, tert-butylbenzene, toluene, 1,2,3-trichloropropane, vinyl chloride, and xylenes (Table 4). In addition, MTBE was detected in a number of wells at concentrations ranging from 0.0006 (RP-3) to 0.0081 (LF-31; Table 5).

Many of the compounds detected in wells LF-12, LF-13, and LF-27 through LF-30 have not been detected at significant levels at the Site, and the sources of these contaminants are likely upgradient from the Site.

4.1.2 A Zone (Inside Slurry Wall)

Nine of the 14 A-zone wells that are inside the slurry wall (EX-1 through EX-10, LF-4, LF-8, LF-17, and LF-26) sampled this quarter contained at least two of the four BTEX compounds (benzene, toluene, ethylbenzene, and total xylenes). One or more of the following chlorinated VOCs were detected in the A-zone wells that are inside the slurry wall: 1,2-DCA, cis-1,2-DCE, trans-1,2-DCE, chlorobenzene, and TCE. The highest chlorinated VOC detection in the A-zone wells that are inside the slurry wall

was 1,2-DCA at a concentration of 0.15 ppm in well EX-9. Other VOCs in samples collected from A-zone wells that are inside the slurry wall are shown in Figures 5a and 5c and Table 4. In addition, MTBE was detected in a number of wells at concentrations ranging from 0.0006 (EX-5) to 0.0072 (EX-7; Table 5).

4.1.3 B Zone

1,2-DCA was detected in samples collected from wells LF-B3, LF-B5, and LF-B6 at concentrations of 0.014 ppm, 0.26 ppm, and 0.079 ppm, respectively (Table 4). In addition, groundwater from wells LF-B3, LF-B4, LF-B5, and LF-B6 contained MTBE in concentrations of 0.014 ppm, 0.0006 ppm, 0.0066, and 0.01 ppm, respectively (Table 5). The sample collected from well LF-B5 contained 0.0039 ppm 1,2,3-trichloropropane, and 0.0025 ppm cis-1,2-DCE. The sample collected from well LF-B5 is representative of groundwater quality in the aquitard between the A zone and the B zone, because the well is screened within the aquitard. The actual water quality in the B zone in the area of LF-B5 is uncertain. Other VOCs were not detected above analytical detection limits in samples from the B zone. In addition, MTBE was detected in a number of wells at concentrations ranging from 0.0006 (LF-B4) to 0.014 (LF-B3; Table 5).

4.2 TPHd

The following sections present the analytical results for TPHd in samples collected from groundwater monitoring wells at and around the Site. Some samples were reported as unknown hydrocarbon mixtures with peak patterns atypical of diesel. These samples with unknown mixtures are quantified as diesel for a range of n-C10 to n-C24 (Table 5).

4.2.1 A Zone (Outside Slurry Wall)

With the exception of wells LF-3, LF-11, LF-20, and LF-21, relatively low concentrations of TPHd (less than 1 ppm) were detected in samples collected from A-zone wells that are outside the slurry wall and downgradient from the Site (excluding the former Rifkin Property wells). Wells LF-3, LF-11, LF-20, and LF-21 contained 14 ppm, 1.1 ppm, 1.5 ppm, and 6.1/5 ppm (primary/duplicate) TPHd, respectively. The two wells upgradient from the Site (LF-12 and LF-13) did not contain TPHd in concentrations above the detection limit (Table 5).

Twenty of the 21 former Rifkin Property and adjacent Horton Street wells sampled this quarter contained concentrations of TPHd above the laboratory detection limit of 0.048 ppm. Samples collected from wells EX-11 through EX-13, LF-19, LF-28 through LF-34, MW-1, MW-3, and RP-1 through RP-5 contained TPHd ranging in concentration from 0.062/0.073 ppm (primary/duplicate) in RP-4 to 4.2 ppm in EX-11. LNAPL was observed in the groundwater in MW-2, and therefore, the sample from this well was not analyzed. Samples collected from wells MW-4 and MW-5 contained 9.1 ppm and 20/18 ppm (primary/duplicate) TPHd, respectively (Table 5).

4.2.2 A Zone (Inside Slurry Wall)

TPHd was detected in all 14 A-zone wells inside the slurry wall sampled this quarter. Samples collected from A-zone wells inside the slurry wall (except for well LF-17) contained TPHd in concentrations ranging from 0.048 ppm in well EX-3 to 3.8 ppm in well EX-5. The sample collected from well LF-17 contained 23 ppm TPHd (Table 5).

4.2.3 B Zone

TPHd was detected in samples collected from B-zone well LF-B3 at 0.11 ppm. The TPHd concentration in the sample collected from wells LF-B4, LF-B5, and LF-B6 did not exceed the laboratory detection limit (Table 5).

4.3 TPHg

The following sections present the analytical results for TPHg from samples collected from groundwater monitoring wells at and around the Site. Some samples were reported as unknown hydrocarbon mixtures with peak patterns atypical of gasoline. These samples with unknown mixtures are quantified as gasoline for a range of n-C7 to n-C12 (Table 5).

4.3.1 A Zone (Outside Slurry Wall)

With the exception of wells LF-3, LF-11, LF-20, and LF-25, concentrations of TPHg did not exceed the detection limit of 0.05 ppm in samples from A-zone wells that are outside the slurry wall and downgradient from the Site (excluding the former Rifkin Property wells). Samples collected from wells LF-11, LF-20, and LF-25 each contained less than 1 ppm TPHg. The sample collected from well LF-3 contained 100 ppm TPHg. The samples collected from the two wells upgradient from the Site (LF-12 and LF-13) were both below the laboratory detection limit of 0.05 ppm (Table 5).

Seventeen of the 21 former Rifkin Property and adjacent Horton Street wells sampled this quarter contained concentrations of TPHg above the laboratory detection limit of 0.05 ppm. Samples collected from wells MW-1, MW-3, MW-4, LF-19, LF-28 through LF-30, LF-33, LF-34, RP-1, and RP-3 through RP-5 contained TPHg concentrations ranging from 0.077/0.061 ppm (primary/duplicate) in RP-4 to 1 ppm in MW-1. LNAPL was observed in the water in MW-2, and therefore, the sample from this well was not analyzed. The sample collected from well MW-5 contained 130/130 ppm TPHg (primary/duplicate; Table 5).

4.3.2 A Zone (Inside Slurry Wall)

TPHg was detected in samples collected from 13 of the 14 A-zone wells sampled inside the slurry wall this quarter. TPHg was detected at concentrations ranging from 0.053

ppm in LF-8 to 69 ppm in EX-8 (Table 5). Well EX-3 did not contain concentrations about the sample detection limit.

4.3.3 B Zone

TPHg was detected in the samples collected from B-zone well LF-B5 at a concentration of 0.14 ppm. TPHg concentrations in the samples collected from wells LF-B3, LF-B4, and LF-B6 did not exceed the laboratory detection limit (Table 5).

4.4 Arsenic

The following sections present the analytical results for dissolved arsenic from samples collected from groundwater monitoring wells at and around the Site. All samples were filtered using a 0.45-micron filter before analysis.

4.4.1 A Zone (Outside Slurry Wall)

Arsenic was detected in samples collected from five of the eight A-zone wells located outside the slurry wall and downgradient from the Site (Table 6). Most samples contained less than 0.5 ppm arsenic, with the exception of wells LF-3 and LF-11, which had arsenic concentrations of 50 ppm and 2.4 ppm, respectively. The samples collected from the two wells upgradient from the Site (LF-12 and LF-13) contained 0.016 ppm and less than 0.005 ppm arsenic, respectively.

Nineteen of the 21 former Rifkin Property and adjacent Horton Street wells sampled this quarter contained concentrations of arsenic above the laboratory detection limit of 0.005 ppm. The samples collected from wells MW-4 and MW-5 contained arsenic concentrations of 1.2 ppm and 250/250 ppm (primary/duplicate), respectively. The sample collected from well LF-28, downgradient from the former Shell Development property, contained an arsenic concentration of 0.20 ppm. Wells MW-3, LF-27, LF-31, and RP-2 (located south of LF-28 and between the Sherwin-Williams arsenic source area and LF-28) had low arsenic concentrations of 0.033 ppm, 0.0057/0.0064 ppm (primary/duplicate), less than 0.005 ppm and 0.01 ppm, respectively. Samples from the nine remaining wells that contained concentrations of arsenic above the detection limit ranged from 0.0059/less than 0.005 ppm (primary/duplicate) in RP-4 to 0.1 ppm in RP-1.

4.4.2 A Zone (Inside Slurry Wall)

Thirteen of the 14 of the A-zone wells inside the slurry wall sampled this quarter contained arsenic above the laboratory detection limit. Arsenic concentrations in these 13 wells ranged from 0.0086 ppm in EX-5 to 430 ppm EX-9. Well EX-4 did not contain arsenic above the 0.005 ppm screening criteria. The samples from wells located in the southeastern portion of the area enclosed by the slurry wall contained elevated arsenic concentrations (greater than 1 ppm and as high as 430 ppm). In contrast, wells

located in the northern and eastern portion of the area enclosed by the slurry wall contained low arsenic concentrations (less than 1 ppm).

4.4.3 B Zone

Arsenic was detected in the sample collected from wells LF-B3 and LF-B5 at a concentration of 0.013 ppm and 0.033 ppm, respectively. The concentrations of arsenic in the samples collected from wells LF-B3 and LF-B6 did not exceed the laboratory detection limit. Historically, samples collected from LF-B5 have contained arsenic in concentrations higher than the other B-zone wells. It is important to note that the sample collected from well LF-B5 is representative of groundwater quality in the aquitard between the A zone and B zone, because the well is screened within the aquitard. The actual water quality in the B zone in the area of LF-B5 is uncertain.

4.4.4 Arsenic Concentration Trends

Arsenic concentration trends for each monitoring well were evaluated with the Mann-Kendall statistical analysis method (Gilbert 1987; Table 7). A decreasing trend is observed in wells LF-21, MW-1, and LF-B6. An increasing concentration trend is observed in wells EX-9, EX-10, LF-8, LF-11, MW-5, and RP-5. The remainder of the wells present no trend or have insufficient data for a conclusive trend analyses. Of the six wells presenting increasing arsenic concentration trends, three are located inside the slurry wall (EX-9, EX-10, and LF-8), one is located west of the area enclosed by the slurry wall (LF-11), and two are located on the former Rifkin property adjacent to the Sherwin-Williams Property (MW-5 and RP-5).

5.0 QA/QC PROCEDURES AND RESULTS

QA/QC measures were implemented for the purpose of maintaining data quality and minimizing the potential for field and laboratory cross contamination of samples. QA/QC procedures included collecting trip blank and bailer rinsate blank samples, controlling sampling order, using disposable bailers, and steam cleaning pump hoses daily before and after use.

Tables A-1 and A-2 (Appendix A) are summary tables that provide data typically included on the laboratory reports.

6.0 OPERATION OF THE SHERWIN-WILLIAMS GROUNDWATER EXTRACTION SYSTEM

As specified by the SCR self-monitoring program, Table 8 presents groundwater extraction results for each extraction well and for the Site. Table 9 presents arsenic and total VOC removal results from the groundwater extraction wells.

During the third quarter 1999, groundwater extraction wells EX-1 through EX-10 operated for an estimated 81 days and former Rifkin property extraction wells EX-11 through EX-13 operated for 4 days as part of start-up hydraulic testing activities. In early July 1999, it was discovered that several of the pneumatic pumps in the extraction wells were recirculating supply air instead of pumping groundwater. LFR identified the cause of the problem to be associated with the internal float system in the pneumatic pumps and is working on a permanent solution to this problem. The recirculating air in the discharge lines results in erroneous readings on the individual extraction well flow totalizers located at the treatment system influent manifold system. This problem does not affect the GWTS flow totalizer. Therefore, the total of extracted groundwater from each well for the second and third quarters of 1999 is estimated based on the treatment system totalizer reading (297,859 gallons from July 1 through September 30, 1999) and the total extracted for each well during the first quarter 1999. The combined groundwater extraction from EX-1 through EX-13 for the first, second and third quarters of 1999 is approximately 1,519,915 gallons, which is more than the total volume extracted during all of 1998 (1 million gallons).

Sampling and analysis results for the GWTS are included in a self-monitoring report required by General Waste Discharge Requirements Order No. 94-087, NPDES No. CAG912003, to be submitted under separate cover to the RWQCB.

Table 2
Horizontal Groundwater Potential Differences Across the Slurry Wall
The Sherwin-Williams Company
Emeryville, California

Well Number	Date Measured	Groundwater Elevation (ft)	Horizontal Distance Between Center of Well Screens (ft)	Groundwater Potential Difference (ft/ft) (a)
LF-7	07/12/99	3.21		
LF-19	07/12/99	6.35	13.1	-0.24
LF-8	07/12/99	4.12		
LF-18	07/12/99	4.44	7.7	-0.04
LF-26	07/12/99	4.17		
LF-20	07/12/99	5.10	20.5	-0.05
LF-10	07/12/99	2.95		
LF-21	07/12/99	5.29	30.5	-0.08
LF-PZ13	07/12/99	3.37		
LF-PZ12	07/12/99	5.65	16.5	-0.14
LF-17	07/12/99	4.41		
LF-3	07/12/99	5.94	27.2	-0.06
LF-PZ9	07/12/99	4.72		
LF-PZ11	07/12/99	6.58	17.5	-0.11
LF-22	07/12/99	6.33		
LF-12	07/12/99	7.70	38.3	-0.04
LF-PZ3	07/12/99	5.58		
LF-PZ2	07/12/99	6.74	16.3	-0.07
LF-PZ5	07/12/99	6.33		
LF-PZ4	07/12/99	6.71	14.9	-0.03
LF-PZ21	07/12/99	4.39		
LF-PZ22	07/12/99	6.30	12.0	-0.16

Notes:
(a) Positive potential indicates outward hydraulic gradient; negative potential indicates inward hydraulic gradient
(b) Less than 0.01 ft/ft potential difference

Data entered by LXG. Proofed by KLF.

Table 3
Vertical Groundwater Potential Differences Across the A and B Aquifer Zones
The Sherwin-Williams Company
Emeryville, California

Well Number	Date Measured	Groundwater Elevation (ft)	Vertical Distance Between Center of Well Screens (ft)	Groundwater Potential Difference (ft/ft) (a)
LF-B3	07/12/99	5.90		
LF-10	07/12/99	2.95	26.4	+0.11
LF-B4	07/12/99	7.33		
LF-12	07/12/99	7.70	30.5	-0.01
LF-B5 (b)	07/12/99	6.93		
LF-PZ5	07/12/99	6.33	24.3	+0.02
LF-B6	07/12/99	5.89		
LF-7	07/12/99	3.21	21.2	+0.13

Notes:
(a) Positive potential indicates upward hydraulic gradient; negative potential indicates downward hydraulic gradient
(b) Groundwater elevations in LF-B5 may not represent the B-zone groundwater elevations because LF-B5 is screened in the aquitard between the A and B zones
(c) Less than 0.01 ft/ft potential difference

Data entered by LXG. Proofed by KLF.

Table 4
Summary of Historical Volatile Organic Compounds (EPA 8240 and 8260*) in Groundwater Monitoring Wells
The Sherwin-Williams Company
Emeryville, California
(Results reported in milligrams per liter [mg/L])

Well Number	Date Sampled	1,1,1-TCA	1,2-DCA	1,2-DCP	2-Hexa-none	Acetone	Benzene	Chloro-benzene	Chloro-form	cis-1,2-DCE	Ethyl-benzene	Methyl Ethyl Ketone	PCE	Toluene	trans-1,2-DCE	TCE	Vinyl Chloride	Xylenes, Total

Data QA/QC performed by KLF.

Notes: * = Analysis method changed from EPA 8240 to EPA 8260 beginning in February-March 1998 (1st Quarter 1998)
< = Analyte was not detected at or greater than the detection limit reported
ND = Not detected (no associated detection limit was reported)
na = Not analyzed
DUP = Duplicate sample (field duplicate)
(a) Concentrations for LF-B1 may not represent the B-zone water quality because LF-B1 is screened in the aquitard between the A and B zones.
(b) Concentrations for LF-B5 may not represent the B-zone water quality because LF-B5 is screened in the aquitard between the A and B zones.
GT = Concentration is greater than value reported (concentration exceeds upper limit of test)

Abbreviations for analytes:

1,1,1-TCA = 1,1,1-Trichloroethane
1,1,2-TCA = 1,1,2-Trichloroethane
1,1-DCA = 1,1-Dichloroethane
1,2,4-TMB = 1,2,4-Trimethylbenzene
1,2-DCA = 1,2-Dichloroethane
1,2-DCB = 1,2-Dichlorobenzene
1,2-DCP = 1,2-Dichloropropane
1,3,5-TMB = 1,3,5-Trimethylbenzene
cis-1,2-DCE = cis-1,2-Dichloroethene
PCE = Tetrachloroethene
trans-1,2-DCE = trans-1,2-Dichloroethene
TCE = Trichloroethene

Data qualifiers:

J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.
J2 = Concentration is estimated because the sample was analyzed outside of holding time.
J3 = Concentration is estimated due to surrogate recoveries outside of control limits.
J4 = Concentration is estimated due to relative percent difference (RPD) outside of control limts for laboratory control samples (LCS)
J11 = Concentration is estimated because it was reported at a concentration less than the detection limit.
U5 = Quantified as non-detect (U) based on field blank contamination evaluation.
U6 = Quantified as non-detect (U) based on trip blank contamination evaluation.
U12 = Quantified as non-detect (U) based on source water contamination evaluation.

Table 5
Summary of Historical Total Petroleum Hydrocarbons as Diesel and Gasoline in Groundwater Monitoring Wells
The Sherwin-Williams Company, Emeryville, California
(Results reported in milligrams per liter [mg/L])

Well Number	Notes	Date Sampled	Total Petroleum Hydrocarbons As Diesel	Total Petroleum Hydrocarbons As Gasoline	MTBE

Data QA/QC performed by KLF.

Notes: < = Analyte was not detected at or greater than the detection limit reported

ND = Not detected (no associated detection limit was reported)

na = Not analyzed

(a) Concentrations for LF-B1 may not represent the B-zone water quality because LF-B1 is screened in the aquitard between the A and B zones.

(b) Concentrations for LF-B5 may not represent the B-zone water quality because LF-B5 is screened in the aquitard between the A and B zones.

Data qualifiers and notes for TPH data:

J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated due to surrogate recoveries outside of control limits.

J4= Concentration is estimated due to relative percent difference (RPD) outside of control limit for the laboratory control sample

(c) = Unknown hydrocarbon mixture with peak patterns atypical of diesel is quantified as diesel for a range of n-C10 to n-C24.

(d) = Unknown hydrocarbon mixture with peak patterns atypical of gasoline is quantified as gasoline for a range of n-C07 to n-C12.

(e) = The concentration reported for diesel is due primarily to the presence of a heavier petroleum product, possibly motor oil.

(f) = The concentration reported for diesel is due primarily to the presence of a lighter petroleum product (range C06-C12), possibly gasoline.

(g) = The concentration reported for gasoline is due to the presence of a discrete hydrocarbon peak not indicative of gasoline.

(h) = The concentration reported for gasoline is due primarily to the presence of a heavier hydrocarbon peak not indicative of gasoline.

(i) = The concentration reported for diesel is due to the presence of a discrete hydrocarbon peak not indicative of diesel.

Table 6
Summary of Historical Inorganic Compounds in Groundwater Monitoring Wells
The Sherwin-Williams Company
Emeryville, California
(Results reported in milligrams per liter [mg/L])

Well Number	Notes	Date Sampled	Arsenic	Barium	Beryllium	Cadmium	Lead	Total Chromium	Mercury	Selenium	Silver	Vanadium	Zinc

Data QA/QC performed by KLF.

Notes: Analyses were done by EPA Method 200/6000/7000 Series for selected metals

< = Analyte was not detected at or greater than the detection limit reported

ND = Not detected (no associated detection limit was reported)

na = Not analyzed

DUP = Duplicate sample (field duplicate)

(a) Concentrations for LF-B1 may not represent the B-zone water quality because LF-B1 is screened in the aquitard between the A and B zones.

(b) Concentrations for LF-B5 may not represent the B-zone water quality because LF-B5 is screened in the aquitard between the A and B zones.

Data Qualifiers:

U5 = Qualified as non-detect (U) based on field blank contamination evaluation

U6 = Qualified as non-detect (U) based on trip blank contamination evaluation

U5,6 = For samples analyzed in December, 1989, data were qualified as non-detect (U) based on positive results of both the trip blank (0.014 mg/L) and the bailer rinsate blank (0.013 mg/L) of associated samples. The detection limit for arsenic for this sampling period was set at 0.070 (5 times the reported value of 0.014 mg/L detected in the trip blank sample).

UJ8 = Non-detected value is estimated due to LCS and/or LCD spike percent recoveries outside of control limits.

J8 = Concentration is estimated due to LCS and/or LCD spike percent recoveries outside of control limits.

J10 =Concentration is estimated due to field duplicate RPD outside of control limit

Data entered by WLC. Proofed by LXG.

Notes:

(1) EX-1 totalizer was installed and brought on line on February 23, 1998.
(2) EX-2 totalizer ws installed and brought on line on Febuary 20, 1998.
(3) EX-3 totalizer was installed and brought on line on March 6, 1998.
(4) EX-4 through EX-10 were brought on line for a total of one day each as part of trial runs in December 199
(5) EX-1 through EX-10 totalizer readings do not accurately represent groundwater extracted from April 1999 through September 1999. Extracted total is estimated based on treatment system totalizer reading (663,651 gallons from March 27 through June 30, and 320,345 gallons from July 1 to September 30, 1999) and the percentage of the total extracted for each well is based on the previous quarter's extraction data.

	1-Jul-99 to 30-Sep-99	(5)	81	297,859	38.126	94.778	1.170	8.329	20.705	0.256

Data entered by WLC. Proofed by LXG.

Notes:

(1) EX-1 totalizer was installed and brought on line on Febuary 23, 1998.

(2) EX-2 totalizer ws installed and brought on line on February 20, 1998.

(3) EX-3 totalizer was installed and brought on line on March 6, 1998.

(4) EX-4 through EX-10 were brought on line for a total of one day each as part of trial runs in December 1998.

(5) EX-1 through EX-10 totalizer readings do not accurately represent groundwater extracted from April 1999 through September 1999. Extracted total is estimated based on treatment system totalizer reading (663,651 gallons from March 27 through June 30, and 320,345 gallons from July 1 to September 30, 1999) and the percentage of the total extracted for each well is based on the previous quarter's extraction data.

Summary of QA/QC

Go Back

Table A-1 Summary of Sampling QA/QC		
Site Name: The Sherwin-Williams Facility	**Site Address:** 1450 Sherwin Avenue Emeryville, California	**Monitoring Period Covered:** July 1 to September 30, 1999

Sampling Performed By: Jeff Rogers and Karl Brunckhorst
Firm Name: LFR Levine - Fricke
Firm Address: 1900 Powell Street, Emeryville, California
Firm Contact: Mike Marsden
Firm Telephone Number: (510) 652-4500

Were chain-of-custody forms completed for all samples?	☑ Yes	☐ No
Were field parameters stabilized prior to taking samples?	☑ Yes	☐ No
For VOCs samples, was there zero head space in sample containers?	☑ Yes	☐ No
Were samples preserved according to analytical method?	☑ Yes	☐ No
Were the required field QA/QC samples taken?	☑ Yes	☐ No

For any questions above answered with "No", please provide an explanation:

Data proofed by KLF. QA/QC by SXS.

Table A-2
Summary of Analytical QA/QC

Site Name:	Site Address:	Monitoring Period Covered:
The Sherwin-Williams Facility	1450 Sherwin Avenue Emeryville, California	July 1 to September 30, 1999

Analysis Performed By:
Lab Name: Curtis and Tompkins, Ltd.
Lab Address: 2323 Fifth Street, Berkeley, CA 94710
Lab Contact: Tracy Babjar
Lab Telephone Number: (510) 486-0925

Analytical Method Used: (check applicable methods)

- ☐ Total Dissolved Solids by EPA Method_____
- ☐ Bioassay 96-hr % survival by Standard Method
- ☐ Turbidity (NTU) by EPA Method_____
- ☐ Dissolved Oxygen (mg/l and % saturation) by Standard Method
- ☐ Hardness (mg/l CaCO3) by EPA Method_____
- ☑ Arsenic by EPA Method 206.2 or 7060 or 6010
- ☐ Cadmium by EPA Method_____
- ☐ Chromium (total) by EPA Method_____
- ☐ Chromium (hexavalent)
- ☐ Copper by EPA Method_____
- ☐ Lead by EPA Method_____
- ☐ Mercury by EPA Method_____
- ☐ Nickel by EPA Method_____
- ☐ Selenium by EPA Method_____
- ☐ Silver by EPA Method_____
- ☐ Zinc by EPA Method_____
- ☐ Halogenated Volatile Organics by EPA Method 601 or 8010
- ☐ Aromatic and Unsaturated Volatile Organics by EPA 602 or 8020
- ☑ Volatile Organics by EPA Method 624 or 8240 or 8260
- ☐ Semivolatile Organics by EPA Method 625 or 8270
- ☐ EDB and DBCP by EPA Method 504
- ☑ TPH gasoline by EPA Method 8015 modified
- ☑ TPH diesel by EPA Method 8015 modified

Is the lab state-certified for the above analytical method(s)?	☑ Yes	☐ No
Were analyses performed according to standard methods?	☑ Yes	☐ No
Were sample holding times met?	☑ Yes	☐ No
Were all reported analytical results values above MDLs?	☑ Yes	☐ No
Were QA/QC samples (i.e., blanks, field replicates, spikes, and surrogates) analyzed in accordance and consistent with the analytical method?	☑ Yes	☐ No
Did QA/QC results meet all acceptance criteria?	☐ Yes	☑ No
Are QA/QC results and acceptance criteria on file?	☑ Yes	☐ No

Table A-2 Summary of Analytical QA/QC		
Site Name: The Sherwin-Williams Facility	**Site Address:** 1450 Sherwin Avenue Emeryville, California	**Monitoring Period Covered:** July 1 to September 30, 1999

For any questions above answered with "No", please provide an explanation: *

For samples 50-54-002-071599, 50-54-007-071599, and 50-54-009-071599 detected results for TPH-gasoline were qualified as estimated values because the surrogate spike recoveries were outside the laboratory upper control limit.

The source water blank had a detection of chloroform at 0.001 ppm. Each of the field rinsates had 0.0008 or 0.0009 ppm chloroform (from the source water). No qualifier was assigned.

Data entered by LXG. QA/QC by SXS.

* The explanation should describe any modifications to standard methods and whether approved by Board staff, and describe corrective actions taken in response to any QA/QC results that fall outside acceptance criteria.

Table B-1
Field Parameters Measured During Purging and Sampling, July 1999
The Sherwin-Williams Company
Emeryville, California

Well Number	Date Sampled	Well Volume (gallons)	Volume Purged (gallons)	pH	Temperature (Deg C)	Specific Conductance (µmhos/cm)
MW-4	07/16/99	1.5	4.5	3.02	19.8	1054
MW-5	07/19/99	1.5	4.5	4.52	19.6	1066

* = Operational extraction well
NM = No measurement obtained

Data entered by LXG. Proofed by KLF.

Appendix C

Complete Analytical Results for Groundwater Monitoring Wells July 1999

			Xylenes (total)	<0.5	U	0.5	ug/L	
		TPH (EPA 8015M)	**TPH as Diesel**	**480**		48	ug/L	
			TPH as Gas	**70**		50	ug/L	

Notes: < = Analyte was not detected at or greater than the detection limit reported

Abreviations:

DUP = Duplicate sample (field duplicate)

TPH = Total Petroleum Hydrocarbons

VOCs = Volatile Organic Compounds

Data Qualifiers:

U = Not detected at or greater than the detection limit reported

U5 = Qualified as non-detect (U) based on field blank contamination evaluation

U6 = Qualified as non-detect (U) based on trip blank contamination evaluation

J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated due to surrogate recoveries outside of control limits.

J4 = Concentration is estimated due to relative percent difference (RPD) outside of control limits for laboratory control samples (LCS)

J11 = Concentration is estimated because it was reported at a concentration less than the detection limit.

Appendix C-2
Complete Analytical Results for Field QC (Field, Trip Blanks and Source Water) for July 1999 (Third Qtr. 1999 Monitoring)
The Sherwin-Williams Company
Emeryville, California

Sample Number	Sample Date	Analytical Group (Method)	Parameter	Result	Quals	Detection Limit	Units	Field Sample ID
TB1-071999	07/19/99	VOCs (EPA 8260A)	Vinyl Acetate	<10	U	10	ug/L	981-071999
			Vinyl Chloride	<0.5	U	0.5	ug/L	
			Xylenes (total)	<0.5	U	0.5	ug/L	

Notes: < = Analyte was not detected at or greater than the detection limit reported

Abreviations:

FB = Field blank

TB = Trip blank

TPH = Total Petroleum Hydrocarbons

VOCs = Volatile Organic Compounds

Data Qualifiers:

U = Not detected at or greater than the detection limit reported

U5 = Qualified as non-detect (U) based on field blank contamination evaluation

U6 = Qualified as non-detect (U) based on trip blank contamination evaluation

J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated due to surrogate recoveries outside of control limits.

J4 = Concentration is estimated due to relative percent difference (RPD) outside of control limits for laboratory control samples (LCS)
