Subject: Quarterly Self-Monitoring Report, October 1 to December 31, 1999, Site Cleanup Requirements Order No. 98-009, The Sherwin-Williams Company, Emeryville, California

Dear Mr. Johnson:

Enclosed is the self-monitoring report, prepared by LFR Levine-Fricke (LFR) on behalf of The Sherwin-Williams Company, for the quarterly period of October 1 through December 31, 1999. This self-monitoring report is submitted pursuant to the requirements of Site Cleanup Requirements (SCR) Order No. 98-009, issued by the Regional Water Quality Control Board on February 19, 1998. Self-monitoring activities conducted at The Sherwin-Williams Company site in Emeryville, California ("the Site") during this quarterly reporting period were in compliance with requirements of the SCR and self-monitoring program. This report summarizes the eleventh consecutive quarter of data collected in the self-monitoring program, which consists of the sampling and analysis of 53 wells. Since December 1989, approximately 22 sampling events have been conducted at the Site. As discussed previously, The Sherwin Williams Company will be proposing an amended self-monitoring program.

This report presents historical data and the results of the quarterly groundwater-monitoring program conducted at the Site in October 1999. In addition, this report includes summaries of the operation of the Sherwin-Williams groundwater extraction and treatment systems and information about removal of contaminants from extracted groundwater at the Site, as required by the SCR.

I certify, under penalty of perjury, that this document and all attachments are prepared under my direction or supervision and the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

If you have any questions or comments regarding this report, please call Larry Mencin at (216) 566-1768 or me at (510) 652-4500.

Sincerely,

(original, signed letter on file with the Regional Water Quality Control Board)

Michael B. Marsden, R.G., C.HG.

1.0 INTRODUCTION AND SCOPE

LFR Levine-Fricke (LFR) prepared this quarterly groundwater monitoring report for the period of October 1 through December 31, 1999, on behalf of The Sherwin-Williams Company, as part of a self-monitoring program for the manufacturing facility located at 1450 Sherwin Avenue in Emeryville, California ("the Site"; [Figures 1 and 2](#)).

This quarterly report is submitted in accordance with the self-monitoring requirements specified in Site Cleanup Requirements (SCR) Order No. 98-009, issued to The Sherwin-Williams Company by the California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB) on February 19, 1998 (RWQCB 1998).

In October 1999, LFR conducted the following groundwater monitoring activities for this quarter:

- Groundwater elevations were measured in 87 wells/piezometers: on- and off-site monitoring wells LF-3, LF-4, LF-7, LF-8, LF-10 through LF-13, LF-17 through LF-35, LF-B3 through LF-B6, EX-1 through EX-14, RP-1 through RP-5, MW-1 through MW-5, SA-AW-01, SA-AW-03 through SA-AW-05, SA-BW-01 and RP-BW-02 and on- and off-site piezometers LFPZ-1 through LFPZ-26.
- Groundwater samples were collected at the Site from 53 wells. Thirty-one A-zone monitoring wells are located outside the site slurry wall, 2 A-zone extraction wells are located outside the site slurry wall, 4 A-zone monitoring wells are located inside the site slurry wall, 10 A-zone extraction wells are located inside the site slurry wall, and 6 B-zone monitoring wells are located throughout the Site. The samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8260; total petroleum hydrocarbon (TPH) as diesel (TPHd) using EPA Extraction Method 3510; TPH as gasoline (TPHg) using EPA Extraction Method 5030; and dissolved arsenic using EPA Method 7060.

Additional Investigative Work Conducted During This Period

- Extraction well EX-14; monitoring wells LF-35, SA-AW-01, SA-AW-03, SA-AW-04, SA-AW-05, SA-BW-01, and RP-BW-02; and piezometer LF-PZ26 were installed during the third quarter of 1999 and sampled during the fourth quarter. Data from these monitoring points are presented in this report for the first time.
- A sequence of pumping tests was conducted in July through October 1999, on the former Rifkin property. The pumping tests show a differing response between wells designed to fully penetrate the A zone (installed in both the upper and lower A-zone sand units) and wells installed in the upper A-zone sand. Abandonment and re-installation for the three extraction wells, eight piezometers, five monitoring wells designed to fully penetrate the A zone began during the fourth quarter of 1999. In

addition, installation of four monitoring wells in the lower A-zone sand to monitor this unit was initiated during this quarter. This work was conducted in accordance with the work plan dated December 22, 1999 (LFR 1999). Data from these wells will be presented in the groundwater monitoring report for the first quarter of 2000.

This report also presents data on groundwater extraction and removal of contaminants from groundwater at the Site, as required by SCR Order No. 98-009.

2.0 GROUNDWATER GRADIENT AND POTENTIAL DIFFERENCES

Groundwater elevations were measured in extraction wells, monitoring wells, and piezometers on October 8, 1999. Groundwater elevation data are presented in [Table 1](#). Groundwater elevations in the A zone and the B zone are illustrated in [Figures 3](#) and [4](#), respectively.

Between the previous quarter (as measured on July 12, 1999) and the current quarter (as measured on October 8, 1999), water levels decreased by an average of approximately 0.3 foot inside the slurry wall and approximately 0.2 foot outside the slurry wall. In the B zone, which is not laterally confined by the slurry wall, water levels decreased on average of approximately 0.1 foot over the same time period. The decrease in water levels observed inside and outside the slurry wall and in both groundwater zones is consistent with the dry months (April through November) and contrasts the increase in water levels observed during the wet months (December through March). Water levels have decreased at a greater rate inside the slurry wall because of groundwater extraction and decreased recharge.

During the third quarter of 1999, A-zone piezometer LFPZ-26 was installed in the southern raised-cap area, approximately 20 feet northwest of piezometer LFPZ-7 ([Figure 2](#)). Initially, LFPZ-7 was installed to monitor water levels inside the slurry wall. However, historical water levels measured in LFPZ-7 were consistent with water levels observed outside the slurry wall. The difference in water levels between LFPZ-26 and LFPZ-7 (1.5 feet; [Table 1](#)), as measured during the fourth quarter of 1999, confirm that the piezometers are on opposite sides of the slurry wall and constitute a new piezometer pair across the slurry wall. The illustrated location of the slurry wall on site figures has been adjusted from previous reports to reflect this interpretation of the data.

2.1 Horizontal Groundwater Gradient

A Zone (Outside Slurry Wall)

As shown in [Figure 3](#), the A-zone groundwater gradient south of the slurry wall is generally 0.004 foot per foot toward the northwest (between wells LF-13 and LF-11). Gradients appear to change in isolated areas as a result of influence from the site slurry

wall and Temescal Creek. Outside the slurry wall, the groundwater gradient is generally to the northwest. Extraction well EX-14, located on the former Rifkin property, was operational when water levels were measured on October 18, 1999. This extraction well was brought on line a few days before water levels were measured as part of hydraulic testing activities.

A Zone (Inside Slurry Wall)

All 10 extraction wells located inside the slurry wall (EX-1 through EX-10) were operational when water levels were measured on October 8, 1999. Groundwater extraction has influenced groundwater elevations measured in the A zone inside the slurry wall. The groundwater gradient in the western portion of the area enclosed by the slurry wall is nearly flat with flow toward extraction wells EX-1, EX-2, and EX-4 through EX-6. The groundwater gradient is steeper in the southern portion of the area enclosed by the slurry wall and is generally toward the west. In the southeastern corner of the area enclosed by the slurry wall, there is a steep gradient away from the corner toward extraction well EX-3.

B Zone

As shown in [Figure 4](#), the groundwater elevations in the three B-zone monitoring wells in the northwestern part of the Site (LF-B3, LF-B6, and SA-BW-01) are slightly lower than the groundwater elevations in the three B-zone monitoring wells in the southeastern part of the Site (LF-B4, LF-B5, RP-BW-02). These elevations indicate that B-zone groundwater at the Site on October 8, 1999, generally flowed from the southeast to the northwest.

2.2 Groundwater Potential Differences Across the Slurry Wall

As indicated in [Table 2](#), the horizontal groundwater potential across the slurry wall on October 8, 1999, was inward in all 12 well/piezometer pairs that are located along the slurry wall. In other words, in all well/piezometer pairs, the groundwater elevation from the well outside the slurry wall is greater than the groundwater elevation of the adjacent well inside the slurry wall. The horizontal potential across the slurry wall measured this quarter contrasts with the groundwater potential difference measured on the first quarter of 1998, when all well pairs had an outward potential. This indicates that within the past two years, the groundwater elevation inside the slurry wall has decreased more than the groundwater level outside the slurry wall. This decrease is associated with increased extraction volumes resulting from improvements to the groundwater treatment system (GWTS). The marked decrease in water levels inside the slurry wall is also an indication that the slurry wall is inhibiting the movement of A-zone groundwater into and out of the area enclosed by the slurry wall, and that the cap and storm-water system is impeding infiltration into the Site.

2.3 Groundwater Potential Differences Across the A/B Aquitard

As indicated in [Table 3](#), the vertical groundwater potential difference across the A/B aquitard on October 8, 1999, was upward at three of the six A- and B-zone well pairs. The groundwater potential difference across the A/B aquitard in well pairs LF-12/LF-B4, MW-5/RP-BW-02, and SA-AW-01/SA-BW-01 was downward. These three well pairs are outside the slurry wall. The three well pairs with upward potential are inside the slurry wall. This contrast shows that the groundwater extraction system is lowering the groundwater elevations in the A zone inside the slurry wall. The upward gradient in well pairs LF-10/LF-B3, LF-7/LF-B6, and LF-PZ6/LF-B5 contrasts the groundwater potential difference across the A/B aquitard measured in the first quarter of 1998, when these well pairs showed downward or near zero potential. This indicates that within the past two years, the groundwater potential in the A zone inside the slurry wall has decreased more than the groundwater potential in the B zone. Once again, this decrease is associated with increased extraction rates resulting from improvements to the GWTS. It is important to note that the vertical groundwater potential difference at well pair LFPZ-6/LF-B5 may not be representative because LF-B5 is screened in the A/B aquitard.

3.0 GROUNDWATER QUALITY SAMPLING

Groundwater samples were collected for chemical analysis for the majority of the wells from October 10 through 15, 1999. Well EX-14 was sampled on October 8, 1999, and, wells EX-12, LF32, LF-33, and RP-1 through RP-5 were sampled on October 25, 1999. Groundwater samples were collected and analyzed from all the site extraction wells, A-zone monitoring wells, and B-zone monitoring wells required by the SCR, except for wells MW-2 and LF-23 through LF-25. The water sample from well MW-2 was not analyzed during this sampling event because of the presence of light nonaqueous phase liquid (LNAPL). Wells LF-23 through LF-25 are west of the railroad tracks and can only be accessed by crossing the tracks. Sherwin-Williams is working with the railroad authorities to determine a safe location to cross the tracks and access the wells. Sampling of wells LF-7, LF-10, and LF-22 is not required by the SCR; however, these wells are sampled during the first quarter of each calendar year.

A minimum of three well volumes of water was purged from each monitoring well before sampling. The wells were purged either by pumping with a centrifugal pump or by hand bailing with a disposable polyethylene bailer. Wells that recovered slowly were purged dry and allowed to recover to a minimum of 80 percent of the initial well volume (or after a maximum of two hours) before they were sampled. The hoses attached to the centrifugal pump were cleaned with high-pressure hot water (steam cleaned) before each use. The evacuated water was pumped into a portable storage tank and then transferred and discharged into the GWTS. Field parameters (temperature, pH, and specific conductance of the evacuated water) were recorded during purging; wells were sampled after the parameters had stabilized.

After each well had been purged, a sample was collected from that monitoring well for laboratory analysis using a new, disposable polyethylene bailer. Samples from operational extraction wells were collected at discharge ports at the site treatment system. All work was conducted in compliance with the Quality Assurance Project Plan (ENTRIX 1998) and the Health and Safety Plan (LFR 1998) for the Site. The samples designated for chemical analysis were analyzed according to EPA Method protocol by Curtis and Tompkins, Ltd., a state-certified laboratory located in Berkeley, California. In accordance with the RWQCB's letter dated November 5, 1996, and SCR Order No. 98-009, analytical laboratory reports and chain-of-custody forms for these samples are not presented in this report. The data will be kept on file at LFR's Emeryville office. [Appendix A](#) includes a quality assurance/quality control (QA/QC) review of groundwater sampling and analytical results, and is provided in lieu of raw data such as field data sheets, laboratory data sheets, QA/QC data, and chain-of-custody forms.

4.0 GROUNDWATER QUALITY ANALYSIS RESULTS

Analytical results of groundwater samples are presented in [Table 4](#) for VOCs, [Table 5](#) for TPHd and TPHg, and [Table 6](#) for inorganic compounds. [Table 7](#) presents a summary of arsenic concentration trends interpreted using the Mann-Kendall statistical evaluation method. Field parameters collected during groundwater sampling, including pH, are presented in Table B-1 in [Appendix B](#). A complete listing of laboratory analytical results, including QA/QC data, is provided in [Appendix C](#).

[Figures 5a through 5d](#) show concentrations of VOCs detected in A-zone groundwater, [Figure 6](#) shows concentrations of VOCs detected in B-zone groundwater, [Figure 7](#) shows concentrations of TPHd in A- and B-zone groundwater, [Figure 8](#) shows concentrations of TPHg in A- and B-zone groundwater, [Figure 9](#) shows concentrations of arsenic in A-zone groundwater, and [Figure 10](#) shows concentrations of arsenic in B-zone groundwater.

4.1 Volatile Organic Compounds

The following sections present the analytical results for VOCs in samples collected from groundwater monitoring wells at and around the Site.

4.1.1 A Zone (Outside Slurry Wall)

Analytical results for groundwater samples collected from A-zone wells sampled this quarter that are outside the slurry wall and downgradient from portions of the Site (LF-3, LF-11, LF-18, LF-20, LF-21, [excluding former Rifkin property wells]) did not contain VOCs above the laboratory detection limits, with the exception of samples from wells LF-3 and LF-11 ([Figures 5a through 5d](#)). The sample collected from well LF-3 contained ethylbenzene, toluene, and xylenes at concentrations of 4.4 parts per million (ppm), 66 ppm, and 22.2 ppm, respectively. The sample collected from well LF-11 contained 0.0005/0.0005 ppm (primary/duplicate) tert-butylbenzene.

The samples collected from the A-zone wells that are outside the slurry wall and upgradient (LF-12 and LF-13) and crossgradient to the south (SA-AW-04 and SA-AW-05) from the Site contained 1,1,1-trichloroethane (1,1,1-TCA), tetrachloroethene (PCE), and trichloroethene (TCE) above the laboratory detection limit. For these four wells, the highest total VOC concentrations were detected in well SA-AW-05 (0.008 ppm) The sample from well SA-AW-03 did not contain VOCs above the laboratory detection limit.

Analytical results for samples collected during this sampling event from the former Rifkin property and adjacent Horton Street A-zone wells (EX-12, EX-14, RP-1 through RP-5, MW-1 through MW-5, LF-19, and LF-27 through LF-35) indicated that all 21 of the wells sampled this quarter contained concentrations of at least one VOC above laboratory detection limits (Figures 5a and 5b). The highest total VOC concentrations were detected in well MW-5, and the greatest number of VOC contaminants were detected in wells LF-27 through LF-30. The sample from well MW-5 contained 150 ppm acetone, 73 ppm 2-butanone, 1.2 ppm ethylbenzene, 29 ppm 4-methyl-2-pentanone, 65 ppm toluene, and 5.6 ppm xylenes.

Wells LF-27 through LF-30, which are downgradient from the former Shell Development Property and upgradient from the former Rifkin property (Figures 5a and 5b), contained one or more of the following compounds in concentrations above the detection limit: benzene, chlorobenzene, chloroform, 1,2-dichloroethene (1,2-DCE), cis-1,2-DCE, trans-1,2-DCE, 1,2-dichloropropane, PCE, 1,1-dichloroethane (1,1-DCA), 1,2-DCA, dichlorodifluoromethane, isopropylbenzene, methyl tertiary-butyl ether (MTBE), TCE, tert-butylbenzene, toluene, 1,2,3-trichloropropane, vinyl chloride, and xylenes (Table 4). In addition, MTBE was detected in 14 of the 21 wells at concentrations ranging from 0.0006 ppm (RP-3) to 0.0064 ppm (LF-31; Table 5).

Many of the compounds detected in wells LF-12, LF-13, and LF-27 through LF-30 have not been detected at significant concentrations at the Site, and the sources of these contaminants are likely upgradient from the Site.

4.1.2 A Zone (Inside Slurry Wall)

Six of the 14 A-zone wells sampled this quarter that are inside the slurry wall contained at least two of the four BTEX compounds (benzene, toluene, ethylbenzene, and total xylenes). One or more of the following chlorinated VOCs were detected in the A-zone wells inside the slurry wall: 1,2-DCA, cis-1,2-DCE, trans-1,2-DCE, chlorobenzene, and TCE. The highest chlorinated VOC detection in the A-zone wells that are inside the slurry wall was 1,2-DCA at a concentration of 0.19 ppm in well EX-9. Other VOCs in samples collected from A-zone wells inside the slurry wall are shown in Figures 5a and 5c and Table 4. In addition, MTBE was detected in a number of wells at concentrations ranging from 0.0007 (EX-3) to 0.0075 (EX-7; Table 5).

4.1.3 B Zone

1,2-DCA was detected in samples collected from wells LF-B3, LF-B5, LF-B6, and RP-BW-02 at concentrations of 0.012 ppm, 0.27/0.026 ppm, 0.09 ppm, and 0.16 ppm, respectively (Table 4). In addition, groundwater from wells LF-B3, LF-B5, LF-B6, and RP-BW-02 contained MTBE at concentrations of 0.015 ppm, 0.0061/0.0058 ppm, 0.0098 ppm, and 0.0098 ppm, respectively (Table 5). The sample collected from well LF-B5 contained 0.0039 ppm 1,2,3-trichloropropane, and 0.0044/0.0029 ppm cis-1,2-DCE. Acetone was detected in samples from RP-BW-02 and SA-BW-01. The sample collected from well LF-B5 is representative of groundwater quality in the aquitard between the A zone and B zone, because the well is screened within the aquitard. The actual water quality in the B zone in the area of LF-B5 is uncertain.

4.2 TPHd

The following sections present the analytical results for TPHd in samples collected from groundwater monitoring wells at and around the Site. Some samples were reported as unknown hydrocarbon mixtures with peak patterns atypical of diesel. These samples with unknown mixtures are quantified as diesel for a range of n-C10 to n-C24 (Table 5).

4.2.1 A Zone (Outside Slurry Wall)

With the exception of wells LF-3, LF-20, and LF-21, relatively low concentrations of TPHd (less than 1 ppm) were detected in samples collected from A-zone wells sampled this quarter that are outside the slurry wall and downgradient from the Site (excluding the former Rifkin property wells). Wells LF-3, LF-20, and LF-21 contained 13 ppm, 1.9 ppm, and 1.2 ppm TPHd, respectively. The two wells upgradient of the Site (LF-12 and LF-13) and the three wells south and crossgradient to the Site (SA-AW-03 through SA-AW-05) did not contain TPHd at concentrations above the detection limit (Table 5).

Nineteen of the 21 former Rifkin Property and adjacent Horton Street wells sampled this quarter contained concentrations of TPHd above the laboratory detection limit. Samples collected from wells EX-12, EX-14, LF-19, LF-28 through LF-34, MW-1, MW-3, and RP-1 through RP-5 contained TPHd at concentrations ranging from 0.047 ppm in MW-3 to 2.1 ppm in LF-19. LNAPL was observed in the groundwater in MW-2; therefore, the sample from this well was not analyzed. Samples collected from wells MW-4 and MW-5 contained 10 ppm and 22 ppm TPHd, respectively (Table 5).

4.2.2 A Zone (Inside Slurry Wall)

TPHd was detected in 12 of the 14 A-zone wells inside the slurry wall sampled this quarter. Samples collected from A-zone wells inside the slurry wall (except for well LF-17) contained TPHd at concentrations ranging from 0.2 ppm in well LF-8 to 4.2

ppm in well EX-8. The sample collected from well LF-17 contained 15/15 ppm TPHd (Table 5).

4.2.3 B Zone

TPHd was detected in samples collected from three of the six B-zone wells. Wells LF-B3, LF-B4, and RP-BW-02 contained 0.18 ppm, 0.12 ppm, and 1.4 ppm TPHd, respectively. The TPHd concentration in the sample collected from wells LF-B5, LF-B6, and SA-AW-1 did not exceed the laboratory detection limit (Table 5).

4.3 TPHg

The following sections present the analytical results for TPHg in samples collected from groundwater monitoring wells at and around the Site. Some samples were reported as unknown hydrocarbon mixtures with peak patterns atypical of gasoline. These samples with unknown mixtures are quantified as gasoline for a range of n-C7 to n-C12 (Table 5).

4.3.1 A Zone (Outside Slurry Wall)

With the exception of wells LF-3, LF-11, LF-18, and LF-20, concentrations of TPHg did not exceed the detection limit of 0.05 ppm in samples from A-zone wells sampled this quarter that are outside the slurry wall and downgradient of the Site (excluding the former Rifkin property wells). Samples collected from wells LF-11, LF-18, and LF-20 each contained less than 1 ppm TPHg. The sample collected from well LF-3 contained 210 ppm TPHg. The samples collected from the two wells upgradient of the Site (LF-12 and LF-13) and the three wells crossgradient and south of the Site (SA-AW-03 through SA-AW-05) were below the laboratory detection limit of 0.05 ppm (Table 5).

Twelve of the 21 former Rifkin property and adjacent Horton Street wells sampled this quarter contained concentrations of TPHg above the laboratory detection limit of 0.05 ppm. Samples collected from wells MW-1, MW-3, MW-4, LF-19, LF-28 through LF-30, LF-33, LF-34, RP-1, RP-3, and RP-5 contained TPHg concentrations ranging from 0.084 ppm in RP-5 to 1.3/1.2 ppm in LF-29. LNAPL was observed in the water in MW-2; therefore, the sample from this well was not analyzed. The sample collected from well MW-5 contained 190 ppm TPHg (Table 5).

4.3.2 A Zone (Inside Slurry Wall)

TPHg was detected in samples collected from 11 of the 14 A-zone wells sampled inside the slurry wall this quarter. TPHg was detected at concentrations ranging from 0.008 ppm in EX-1 to 25 ppm in EX-8 (Table 5). Wells EX-3, EX-7, and LF-8 did not contain concentrations above the sample detection limit.

4.3.3 B Zone

TPHg was detected in the samples collected from B-zone wells LF-B5, LF-B6, and RP-BW-02 at concentrations of 0.15/0.16 ppm, 0.061 ppm, and 0.11 ppm, respectively. TPHg concentrations in the samples collected from wells LF-B3, LF-B4, and SA-BW-01 did not exceed the laboratory detection limit (Table 5).

4.4 Arsenic

The following sections present the analytical results for dissolved arsenic in samples collected from groundwater monitoring wells at and around the Site. All samples were filtered using a 0.45-micron filter before analysis.

4.4.1 A Zone (Outside Slurry Wall)

Arsenic was detected in samples collected from five of the six A-zone wells located outside the slurry wall and downgradient of the Site (Table 6). Most samples contained less than 0.5 ppm arsenic, with the exception of wells LF-3 and LF-11, which had arsenic concentrations of 61 ppm and 2.2/2.3 ppm, respectively. The samples collected from the two wells upgradient of the Site (LF-12 and LF-13) contained 0.011 ppm and less than 0.005 ppm arsenic, respectively. Groundwater samples collected from wells cross-gradient and south of the Site (SA-AW-03 through SA-AW-05) did not contain arsenic above the laboratory detection limit.

Fifteen of the 21 former Rifkin property and adjacent Horton Street wells sampled this quarter contained concentrations of arsenic above the laboratory detection limit of 0.005 ppm. The samples collected from wells MW-4 and MW-5 contained arsenic concentrations of 0.74 ppm and 260 ppm, respectively. The sample collected from well LF-28, downgradient of the former Shell Development property, contained an arsenic concentration of 0.12 ppm. Wells MW-3, LF-27, LF-31, and RP-2 (located south of LF-28 and between the Sherwin-Williams arsenic source area and LF-28) had arsenic concentrations of 0.023 ppm, 0.0094 ppm, 0.013 ppm, and 0.015 ppm, respectively. Samples from the eight remaining wells that contained concentrations of arsenic above the detection limit ranged from 0.0094 ppm in LF-19 to 0.073 ppm in RP-1.

4.4.2 A Zone (Inside Slurry Wall)

Twelve of the 14 of the A-zone wells inside the slurry wall sampled this quarter contained arsenic above the laboratory detection limit. Arsenic concentrations in these wells ranged from 0.0049 ppm in LF-8 to 170 ppm in EX-9. Wells EX2 and EX-4 did not contain arsenic above the 0.005 ppm screening criteria. The samples from wells located in the southeastern portion of the area enclosed by the slurry wall contained elevated arsenic concentrations (ranging from 4 ppm to 170 ppm). In contrast, wells located in the northern and western portion of the area enclosed by the slurry wall

contained low arsenic concentrations (ranging from below the detection limit to 0.75 ppm).

4.4.3 B Zone

Arsenic was detected in five of the six B-zone wells. Arsenic concentrations in these five wells ranged from 0.0099 ppm (RP-BW-02) to 0.043 ppm (SA-BW-01). The concentrations of arsenic in the samples collected from well LF-B4 did not exceed the laboratory detection limit. Historically, samples collected from LF-B5 have contained arsenic at concentrations higher than other B-zone wells. It is important to note that the sample collected from well LF-B5 is representative of groundwater quality in the aquitard between the A zone and B zone, because the well is screened within the aquitard. The actual water quality in the B zone in the area of LF-B5 is uncertain.

4.4.4 Arsenic Concentration Trends

Arsenic concentration trends for each monitoring well were evaluated with the Mann-Kendall statistical analysis method (Gilbert 1987; [Table 7](#)). A decreasing trend is observed in wells EX-3, MW-4, and LF-B6. An increasing concentration trend is observed in wells EX-10, LF-8, LF-11, and MW-5. The remaining wells present no trend or have insufficient data for conclusive analysis. Of the three wells presenting increasing arsenic concentration trends, two are located inside the slurry wall (LF-8 and EX-10), one is located southwest of the area enclosed by the slurry wall (LF-11), and one is located on the former Rifkin property adjacent to the Sherwin-Williams property (MW-5).

5.0 QA/QC PROCEDURES AND RESULTS

QA/QC measures were implemented for the purpose of maintaining data quality and minimizing the potential for field and laboratory cross contamination of samples. QA/QC procedures included collecting trip blank and bailer rinsate blank samples, controlling sampling order, using disposable bailers, and steam cleaning pump hoses daily before and after use.

Tables A-1 and A-2 ([Appendix A](#)) are summary tables that provide data typically included in laboratory reports.

6.0 OPERATION OF THE SHERWIN-WILLIAMS GROUNDWATER EXTRACTION SYSTEM

As specified by the SCR self-monitoring program, [Table 8](#) presents groundwater extraction results for each extraction well and for the Site. [Table 9](#) presents arsenic and total VOC removal results from the groundwater extraction wells.

During the fourth quarter 1999, groundwater extraction wells EX-1 through EX-10 operated for an estimated 80 days and former Rifkin property extraction well EX-14 operated for four days as part of start-up hydraulic testing activities. In early 1999, several of the pneumatic pumps in the extraction wells were found to be recirculating supply air instead of pumping groundwater. LFR determined that the problem was associated with the internal float system in the pneumatic pumps and is working on a permanent solution to this problem. The recirculating air in the discharge lines results in erroneous readings on the individual extraction well flow totalizers located at the treatment system influent manifold system. This problem does not affect the GWTS flow totalizer. Therefore, the total of extracted groundwater from each well during the fourth quarter of 1999 is estimated based on the treatment system totalizer reading (304,354 gallons from October 1 through December 31, 1999; **Table 8**) and the total extracted for each well during the first quarter 1999. The combined groundwater extraction from EX-1 through EX-14 for 1999 is approximately 1,824,269 gallons, which is nearly double the total volume extracted during all of 1998 (1 million gallons).

Sampling and analysis results for the GWTS are included in a self-monitoring report required by General Waste Discharge Requirements Order No. 94-087, National Pollutant Discharge Elimination System No. CAG912003, to be submitted under separate cover to the RWQCB.

| LF-PZ13 | 10/08/99 | 3.33 | | |
| LF-PZ12 | 10/08/99 | 5.73 | 16.5 | -0.15 |
| LF-17 | 10/08/99 | 4.56 | | |
| LF-3 | 10/08/99 | 6.09 | 27.2 | -0.06 |
| LF-PZ9 | 10/08/99 | 4.87 | | |
| LF-PZ11 | 10/08/99 | 6.64 | 17.5 | -0.10 |
| LF-PZ26 | 10/08/99 | 6.31 | | |
| LF-PZ7 | 10/08/99 | 7.87 | 17.0 | -0.09 |
| LF-22 | 10/08/99 | 5.96 | | |
| LF-12 | 10/08/99 | 7.71 | 38.3 | -0.05 |
| LF-PZ3 | 10/08/99 | 5.26 | | |
| LF-PZ2 | 10/08/99 | 6.45 | 16.3 | -0.07 |
| LF-PZ5 | 10/08/99 | 5.94 | | |
| LF-PZ4 | 10/08/99 | 6.59 | 14.9 | -0.04 |
| LF-PZ21 | 10/08/99 | 4.20 | | |
| LF-PZ22 | 10/08/99 | 6.16 | 12.0 | -0.16 |

Notes:

(a) Positive potential indicates outward hydraulic gradient; negative potential indicates inward hydraulic gradient

(b) Less than 0.01 ft/ft potential difference

Data entered by LXG. Proofed by JTS.

Table 3
Vertical Groundwater Potential Differences Across the A- and B-Aquifer Zones
The Sherwin-Williams Company
Emeryville, California

| Well Number | Date Measured | Groundwater Elevation (ft) | Vertical Distance Between Center of Well Screens (ft) | Groundwater Potential Difference (ft/ft) (a) |
|-------------|---------------|----------------------------|---|--|
| LF-B3 | 10/08/99 | 5.71 | | |
| LF-10 | 10/08/99 | 2.82 | 26.4 | +0.11 |
| LF-B4 | 10/08/99 | 7.44 | | |
| LF-12 | 10/08/99 | 7.71 | 30.5 | -0.01 |
| LF-B5 (b) | 10/08/99 | 6.66 | | |
| LF-PZ5 | 10/08/99 | 5.94 | 24.3 | +0.03 |
| LF-B6 | 10/08/99 | 5.72 | | |
| LF-7 | 10/08/99 | 3.10 | 21.2 | +0.12 |
| RP-BW-02 | 10/08/99 | 6.08 | | |
| MW-5 | 10/08/99 | 6.45 | 30.0 | -0.01 |
| SA-BW-01 | 10/08/99 | 5.43 | | |
| SA-AW-01 | 10/08/99 | 5.84 | 31.0 | -0.01 |

Notes:

- (a) Positive potential indicates upward hydraulic gradient; negative potential indicates downward hydraulic gradient
- (b) Groundwater elevations in LF-B5 may not represent the B-zone groundwater elevations because LF-B5 is screened in the aquitard between the A and B zones
- (c) Less than 0.01 ft/ft potential difference

Data entered by LXG. Proofed by JTS.

Table 4
Summary of Historical Volatile Organic Compounds (EPA 8240 and 8260*) in Groundwater Monitoring Wells
The Sherwin-Williams Company
Emeryville, California
(Results reported in milligrams per liter [mg/L])

| Well Number | Date Sampled | 1,1,1-TCA | 1,2-DCA | 1,2-DCP | 2-Hexa-none | Acetone | Benzene | Chloro-benzene | Chloro-form | cis-1,2-DCE | Ethyl-benzene | Methyl Ethyl Ketone | PCE | Toluene | trans-1,2-DCE | TCE | Vinyl Chloride | Xylenes, Total |
|-------------|--------------|-----------|---------|---------|-------------|---------|---------|----------------|-------------|-------------|---------------|---------------------|-----|---------|---------------|-----|----------------|----------------|
|-------------|--------------|-----------|---------|---------|-------------|---------|---------|----------------|-------------|-------------|---------------|---------------------|-----|---------|---------------|-----|----------------|----------------|

Data QA/QC performed by JTS.

Notes: * = Analysis method changed from EPA 8240 to EPA 8260 beginning in February-March 1998 (1st Quarter 1998)

< = Analyte was not detected at or greater than the detection limit reported

ND = Not detected (no associated detection limit was reported)

na = Not analyzed

DUP = Duplicate sample (field duplicate)

(a) Concentrations for LF-B1 may not represent the B-zone water quality because LF-B1 is screened in the aquitard between the A and B zones.

(b) Concentrations for LF-B5 may not represent the B-zone water quality because LF-B5 is screened in the aquitard between the A and B zones.

GT = Concentration is greater than value reported (concentration exceeds upper limit of test)

Abbreviations for analytes:

1,1,1-TCA = 1,1,1-Trichloroethane

1,2-DCA = 1,2-Dichloroethane

PCE = Tetrachloroethene

1,1,2-TCA = 1,1,2-Trichloroethane

1,2-DCB = 1,2-Dichlorobenzene

trans-1,2-DCE = trans-1,2-Dichloroethene

1,1-DCA = 1,1-Dichloroethane

1,2-DCP = 1,2-Dichloropropane

TCE = Trichloroethene

1,1-DCE = 1,1-Dichloroethene

1,3,5-TMB = 1,3,5-Trimethylbenzene

1,2,4-TMB = 1,2,4-Trimethylbenzene

cis-1,2-DCE = cis-1,2-Dichloroethene

Data qualifiers:

J1 = Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated due to surrogate recoveries outside of control limits.

J4 = Concentration is estimated due to relative percent difference (RPD) outside of control limits for laboratory control samples (LCS)

J10 = Concentration is estimated due to field duplicate RPD outside of control limit.

J11 = Concentration is estimated because it was reported at a concentration less than the detection limit.

U5 = Quantified as non-detect (U) based on field blank contamination evaluation.

U6 = Quantified as non-detect (U) based on trip blank contamination evaluation.

U12 = Quantified as non-detect (U) based on source water contamination evaluation.

Table 5
Summary of Historical Total Petroleum Hydrocarbons as Diesel and Gasoline
in Groundwater Monitoring Wells
The Sherwin-Williams Company, Emeryville, California
(Results reported in milligrams per liter [mg/L])

| Well Number | Notes | Date Sampled | Total Petroleum Hydrocarbons As Diesel | Total Petroleum Hydrocarbons As Gasoline | MTBE |
|-------------|-------|--------------|--|--|------|
|-------------|-------|--------------|--|--|------|

Data QA/QC performed by JTS.

Notes: < = Analyte was not detected at or greater than the detection limit reported
 ND = Not detected (no associated detection limit was reported)
 na = Not analyzed

(a) Concentrations for LF-B1 may not represent the B-zone water quality because LF-B1 is screened in the aquitard between the A and B zones.

(b) Concentrations for LF-B5 may not represent the B-zone water quality because LF-B5 is screened in the aquitard between the A and B zones.

Data qualifiers and notes for TPH data:

J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated due to surrogate recoveries outside of control limits.

J4= Concentration is estimated due to relative percent difference (RPD) outside of control limit for the laboratory control sample

U5 = Quantified as non-detect (U) based on field blank contamination evaluation.

(c) = Unknown hydrocarbon mixture with peak patterns atypical of diesel is quantified as diesel for a range of n-C10 to n-C24.

(d) = Unknown hydrocarbon mixture with peak patterns atypical of gasoline is quantified as gasoline for a range of n-C07 to n-C12.

(e) = The concentration reported for diesel is due primarily to the presence of a heavier petroleum product, possibly motor oil.

(f) = The concentration reported for diesel is due primarily to the presence of a lighter petroleum product (range C06-C12), possibly gasoline.

(g) = The concentration reported for gasoline is due to the presence of a discrete hydrocarbon peak not indicative of gasoline.

(h) = The concentration reported for gasoline is due primarily to the presence of a heavier hydrocarbon peak not indicative of gasoline.

(i) = The concentration reported for diesel is due to the presence of a discrete hydrocarbon peak not indicative of diesel.

Data QA/QC performed by JTS.

Notes: Analyses were done by EPA Method 200/6000/7000 Series for selected metals

< = Analyte was not detected at or greater than the detection limit reported

ND = Not detected (no associated detection limit was reported)

na = Not analyzed

DUP = Duplicate sample (field duplicate)

(a) Concentrations for LF-B1 may not represent the B-zone water quality because LF-B1 is screened in the aquitard between the A and B zones.

(b) Concentrations for LF-B5 may not represent the B-zone water quality because LF-B5 is screened in the aquitard between the A and B zones.

Data Qualifiers:

U5 = Qualified as non-detect (U) based on field blank contamination evaluation

U6 = Qualified as non-detect (U) based on trip blank contamination evaluation

U5,6 = For samples analyzed in December, 1989, data were qualified as non-detect (U) based on positive results of both the trip blank (0.014 mg/L) and the bailer rinsate blank (0.013 mg/L) of associated samples. The detection limit for arsenic for this sampling period was set at 0.070 (5 times the reported value of 0.014 mg/L detected in the trip blank sample).

UJ8 = Non-detected value is estimated due to LCS and/or LCD spike percent recoveries outside of control limits.

J8 = Concentration is estimated due to LCS and/or LCD spike percent recoveries outside of control limits.

J10 = Concentration is estimated due to field duplicate RPD outside of control limit

Data entered by WLC. Proofed by LXG.

Table 8
Groundwater Extraction Flow Data
The Sherwin-Williams Company
Emeryville, California

| Extraction Well Number | Reporting Period | Notes | Number of Operating Days During Period | Total Volume of Groundwater Extracted (gallons) | Average Flow Rate (gpm) |
|------------------------------|---------------------|-------|--|---|-------------------------------|
|------------------------------|---------------------|-------|--|---|-------------------------------|

Notes:

- (1) EX-1 totalizer was installed and brought on line on February 23, 1998.
- (2) EX-2 totalizer was installed and brought on line on February 20, 1998.
- (3) EX-3 totalizer was installed and brought on line on March 6, 1998.
- (4) EX-4 through EX-10 were brought on line for a total of one day each as part of trial runs in December 1998.
- (5) EX-1 through EX-10 totalizer readings do not accurately represent groundwater extracted from April 1999 through September 1999. Extracted total is estimated based on treatment system totalizer reading (663,651 gallons from March 27 through June 30, and 320,345 gallons from July 1 to September 30, 1999) and the percentage of the total extracted for each well is based on the previous quarter's extraction data.
- (6) Water extracted from extraction well EX-14 during the pumping test from October 1 through 22, 1999, was pumped through the conveyance hose and totalizer for EX-12.

Data entered by WLC. Proofed by LXG.

Notes:

- (1) EX-1 totalizer was installed and brought on line on February 23, 1998.
- (2) EX-2 totalizer was installed and brought on line on February 20, 1998.
- (3) EX-3 totalizer was installed and brought on line on March 6, 1998.
- (4) EX-4 through EX-10 were brought on line for a total of one day each as part of trial runs in December 1998.
- (5) EX-1 through EX-10 totalizer readings do not accurately represent groundwater extracted from April 1999 through September 1999. Extracted total is estimated based on treatment system totalizer reading (663,651 gallons from March 27 through June 30, and 320,345 gallons from July 1 to September 30, 1999) and the percentage of the total extracted for each well is based on the previous quarter's extraction data.
- (6) Water extracted from extraction well EX-14 during the pumping test from October 1 through 22, 1999, was pumped through the conveyance hose and totalizer for EX-12.

Volatile Organic Compounds B-Zone Groundwater October 1999

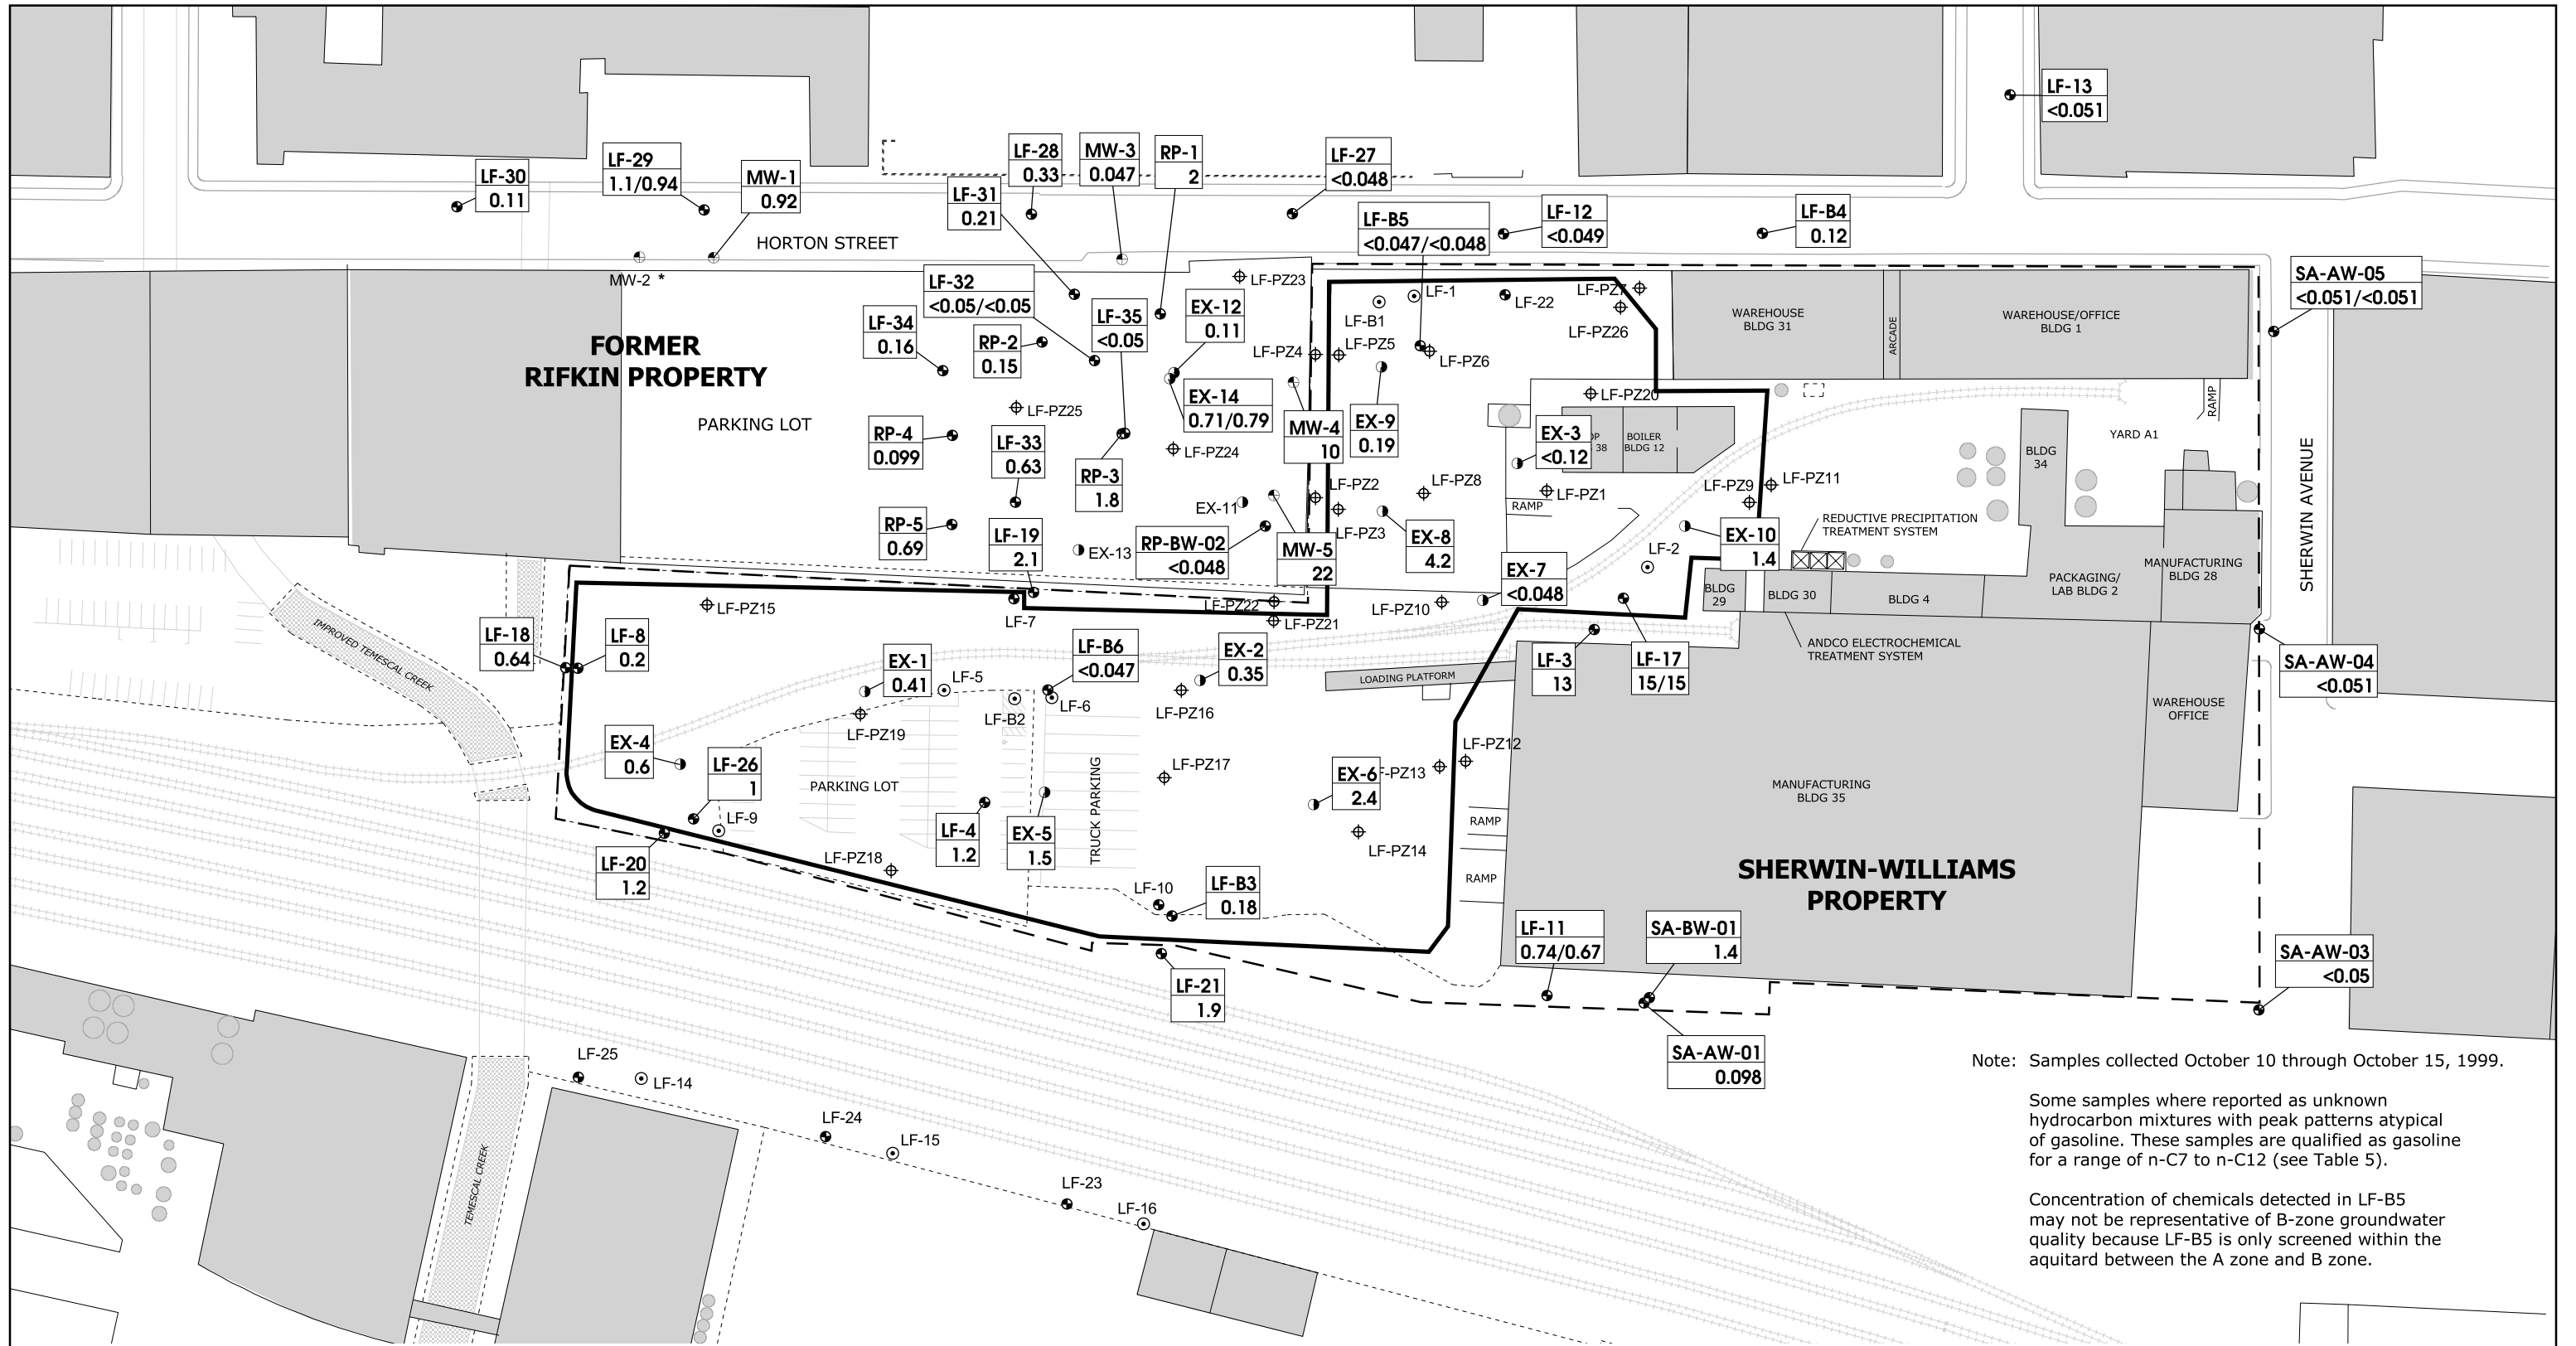

Figure 6

Note: Samples collected October 10 through October 15, 1999.

Some samples were reported as unknown hydrocarbon mixtures with peak patterns atypical of gasoline. These samples are qualified as gasoline for a range of n-C7 to n-C12 (see Table 5).

Concentration of chemicals detected in LF-B5 may not be representative of B-zone groundwater quality because LF-B5 is only screened within the aquitard between the A zone and B zone.

|--|---|---|

Analysis Performed By:
 Lab Name: Curtis and Tompkins, Ltd.
 Lab Address: 2323 Fifth Street, Berkeley, CA 94710
 Lab Contact: Tracy Babjar
 Lab Telephone Number: (510) 486-0900

- Analytical Method Used: (check applicable methods)**
- Total Dissolved Solids by EPA Method _____
 - Bioassay 96-hr % survival by Standard Method
 - Turbidity (NTU) by EPA Method _____
 - Dissolved Oxygen (mg/l and % saturation) by Standard Method
 - Hardness (mg/l CaCO3) by EPA Method _____
 - Arsenic by EPA Method 206.2 or 7060 or 6010
 - Cadmium by EPA Method _____
 - Chromium (total) by EPA Method _____
 - Chromium (hexavalent)
 - Copper by EPA Method _____
 - Lead by EPA Method _____
 - Mercury by EPA Method _____
 - Nickel by EPA Method _____
 - Selenium by EPA Method _____
 - Silver by EPA Method _____
 - Zinc by EPA Method _____
 - Halogenated Volatile Organics by EPA Method 601 or 8010
 - Aromatic and Unsaturated Volatile Organics by EPA 602 or 8020
 - Volatile Organics by EPA Method 624 or 8240 or 8260
 - Semivolatile Organics by EPA Method 625 or 8270
 - EDB and DBCP by EPA Method 504
 - TPH gasoline by EPA Method 8015 modified
 - TPH diesel by EPA Method 8015 modified

|--|---|---|

For any questions above answered with "No", please provide an explanation: *

For samples 10-36-029-101199 (sample) and 10-36-101199 (duplicate), Isopropylbenzene concentrations are qualified and estimated due to duplicate RPD outside of control limit.

For sample 50-54-003-101399, TPHd concentration is qualified as non-detect based on field blank (rinse blank) contamination evaluation.

Data entered by LXG. QA/QC by SXS.

* The explanation should describe any modifications to standard methods and whether approved by Board staff, and describe corrective actions taken in response to any QA/QC results that fall outside acceptance criteria.

Appendix C-1
Complete Analytical Results for Groundwater Monitoring Wells for October 1999 (Fourth Quarter 1999 Monitoring)
The Sherwin-Williams Company
Emeryville, California

| Well Number | Sample Date | Analytical Group (Method) | Parameter | Result | Quals | Detection Limit | Units | Field Sample ID |
|-------------|-------------|---------------------------|-----------|--------|-------|-----------------|-------|-----------------|
|-------------|-------------|---------------------------|-----------|--------|-------|-----------------|-------|-----------------|

Notes: < = Analyte was not detected at or greater than the detection limit reported

Abbreviations:

DUP = Duplicate sample (field duplicate)

TPH = Total Petroleum Hydrocarbons

VOCs = Volatile Organic Compounds

Data Qualifiers:

U = Not detected at or greater than the detection limit reported

U5 = Qualified as non-detect (U) based on field blank contamination evaluation

U6 = Qualified as non-detect (U) based on trip blank contamination evaluation

J1= Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated due to surrogate recoveries outside of control limits.

J4 = Concentration is estimated due to relative percent difference (RPD) outside of control limits for laboratory control samples (LCS).

J10 = Concentration is estimated due to field duplicate RPD outside of control limit.

J11 = Concentration is estimated because it was reported at a concentration less than the detection limit.

| | | | Xylenes (total) | <0.5 | U | 0.5 | ug/L | |

Notes: < = Analyte was not detected at or greater than the detection limit reported

Abbreviations:

FB = Field blank

TB = Trip blank

TPH = Total Petroleum Hydrocarbons

VOCs = Volatile Organic Compounds

Data Qualifiers:

U = Not detected at or greater than the detection limit reported

U5 = Qualified as non-detect (U) based on field blank contamination evaluation

U6 = Qualified as non-detect (U) based on trip blank contamination evaluation

J1 = Concentration is estimated because the concentration exceeded the calibration range of the analytical instrument.

J2 = Concentration is estimated because the sample was analyzed outside of holding time.

J3 = Concentration is estimated due to surrogate recoveries outside of control limits.

J4 = Concentration is estimated due to relative percent difference (RPD) outside of control limits for laboratory control samples (LCS)
