

3/15/2016 Phone Log- RO2981 Red Hanger Kleeners, 6235-6239 College Ave., Oakland

Duration: Approximately 40 minutes

Received a phone call from Paul King regarding his submittal of a work plan for collection of a number of soil gas and GGW samples and the installation of vapor extraction wells. He said the work plan will also propose collection of a lesser number of soil samples. I requested he provide me with a table that would include a column for media sampled and the rationale for the location of the bores. Mr. King also said the property owner was in a rush to implement a soil vapor extraction system.

Mr. King said they has moved away from performing any off-site sampling. He presented a several models that addressed potential off-site PCE sources and how his proposed investigation could identify these sources without performing offsite investigations. Mr. King said this would eliminate the encumbrances imposed for offsite access.

Mr. King said the installation of vapor extraction wells would include a horizontal perforated pipe along a section of the sanitary sewer to address potential impacts along the sewer. This idea has been discussed previously.

As described by Mr. King, the work plan was far ranging. It was unclear if the work plan was solely for an investigation or would a pilot test for vapor extraction.
