West of First Street, Between Spring Street and Ray Street  
Pleasanton, California

Dear Mr. Guenther:

Enclosed is the Supplementary Limited Environmental Site Investigation Report documenting the supplementary soil sampling activities that were conducted by Berlogar Geotechnical Consultants along the portion of the Transportation Corridor located on the west side of First Street, between Spring Street and Ray Street in Pleasanton, California.

If you have any questions or comments concerning this report, please feel free to contact us at (925) 484-0220.

Respectfully submitted,

BERLOGAR GEOTECHNICAL CONSULTANTS

**SUPPLEMENTARY LIMITED ENVIRONMENTAL SITE INVESTIGATION  
TRANSPORTATION CORRIDOR  
WEST OF FIRST STREET, BETWEEN SPRING STREET AND RAY STREET  
PLEASANTON, CALIFORNIA**

**1.0 INTRODUCTION**

This report presents the findings of the Supplementary Limited Environmental Site Investigation that was conducted by Berlogar Geotechnical Consultants (BGC) along the portion of the Transportation Corridor located west of First Street, between Spring Street and Ray Street in Pleasanton, California. The site is shown on the Site Plan, Figure 1.

The purpose of the investigation was to assess the potential presence of petroleum hydrocarbons and metals within the surficial soil at the site associated with the former railway line located at the site.

The investigation was limited to collecting soil samples and analyzing the samples for total petroleum hydrocarbons (TPH) as diesel (TPHd), TPH as motor oil (TPHmo), and metals.

**2.0 SITE DESCRIPTION**

The site is located west of First Street, between Spring Street and Ray Street in Pleasanton, California. The site consists of a rectangular parcel covering an area of approximately 1 acre. The site is currently vacant and unpaved.

**3.0 BACKGROUND**

A rail line corridor occupied the site from 1888 through the early 1990s. The site has been vacant since the removal of the rail line by 1993.

A limited environmental site investigation was performed by BGC at the parcel located south of the site in March 2009. Twenty-four soil samples were collected from twelve test pits and selectively analyzed for TPHg, TPHd, TPHmo, benzene-toluene-ethylbenzene-xylenes, methyl-tertiary butyl ether, volatile organic compounds (VOCs), semi-VOCs, organochlorine pesticides, polychlorinated biphenyls, and metals. Based on the findings of the investigation, it appeared that the surficial soil within the parcel contained antimony, arsenic, lead, mercury, and vanadium concentrations above their respective background levels and the San Francisco Regional Water Quality Control Board's Environmental Screening Levels (ESLs, where groundwater is a current or potential source of drinking water) for residential landuse, and in some cases their commercial/industrial ESLs and STLCs.

#### **4.0 SUPPLEMENTARY LIMITED ENVIRONMENTAL SITE INVESTIGATION**

BGC collected soil samples on June 23, 2009. A total of fourteen soil samples were collected from seven test pit locations (TP-13 through TP-19). The approximate test pit locations are shown on the Site Plan, Figure 1.

The test pits were excavated using a backhoe. Soil samples were collected from the test pits by driving a 2-inch diameter modified California sampler (containing a clean brass tube) into the soil at the prescribed depths. Soil samples designated with suffixes "A" and "B" were collected at depths of approximately 1 and 3 feet below the existing ground surface (bgs), respectively.

After being sealed and labeled, the filled brass tubes were immediately placed in a chilled cooler containing crushed ice for transportation to the laboratory. Proper documentation and field chain-of-custody procedures were followed.

All equipment used during this investigation which might have come into contact with contaminated materials was thoroughly decontaminated before and after each use. This was accomplished by washing with Alconox (a laboratory-grade detergent) and rinsing with distilled water.

#### **5.0 SOIL CONDITIONS**

Soil underlying the site generally consisted of fill over native alluvial soils of sandy clay, clayey silt, sandy silt, silty sand, and sandy gravel. The fill consisted of gravelly clay, gravelly sand, sandy gravel, and gravel. The soil was neither stained nor discolored. Additionally, no hydrocarbon odor was detected. No groundwater was encountered in the test pits.

#### **6.0 LABORATORY ANALYSIS**

The soil samples were sent to McCampbell Analytical, Inc. of Pittsburg, California, a state-certified laboratory, and analyzed for:

- TPHd, and TPHmo using EPA Method 8015B; and
- California Assessment Manual (CAM) 17 Metals using EPA Method 6020A.

The samples were analyzed on a normal turnaround basis.

## **7.0 INVESTIGATION RESULTS**

The laboratory analytical results are summarized in Tables 1 and 2. Laboratory certificates are included in the Appendix. Analytical results were compared to commercial/industrial ESLs.

Laboratory analytical results of the soil samples indicated that TPHd and TPHmo concentrations were below their respective commercial/industrial ESLs.

Metal concentrations detected in the soil samples were within typical background levels and generally below their respective commercial/industrial ESLs, with the exception of antimony and arsenic. The antimony concentration of 51 mg/kg contained in Sample T-17A was above the commercial/industrial ESL of 40 mg/kg. The corresponding deeper Sample T-17B was below the antimony commercial/industrial ESL. Arsenic concentrations detected in all fourteen samples were above the commercial/industrial ESL of 1.6 mg/kg.

## **8.0 DISCUSSION**

Based on the findings of this investigation, it appears that surficial soil within the site extending beyond three feet bgs primarily contains arsenic concentrations that exceed their respective commercial/industrial ESLs.

## **9.0 EXCLUSIONS**

BGC assumes no responsibility or liability for the reliance hereon or use hereof of information contained in this report by anyone other than the party to whom it is addressed and City of Pleasanton.

The evaluations and recommendations presented in this report are based on the limited site investigation results available at this time and could be revised if new information necessitating further review of the site becomes available.

	S	1.0	5.0	mg/Kg

\* water samples are reported in  $\mu\text{g}/\text{L}$ , wipe samples in  $\mu\text{g}/\text{wipe}$ , soil/solid/sludge samples in  $\text{mg}/\text{kg}$ , product/oil/non-aqueous liquid samples in  $\text{mg}/\text{l}$ , and all DISTLC / STLC / SPLC / TCLP extracts are reported in  $\mu\text{g}/\text{l}$ .

# cluttered chromatogram resulting in coeluted surrogate and sample peaks, or; surrogate peak is on elevated baseline, or; surrogate has been diminished by dilution of original extract.

+The following descriptions of the TPH chromatogram are cursory in nature and McCampbell Analytical is not responsible for their interpretation:

e2) diesel range compounds are significant; no recognizable pattern

e7) oil range compounds are significant

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 \* (MS-Sample) / (Amount Spiked); RPD = 100 \* (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not applicable to this method.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.
