CERTIFICATION

This **Limited Phase II Subsurface Investigation** at 1019 Calcot Place in Oakland, California, has been prepared by ERAS Environmental, Inc. (ERAS) under the professional supervision of the Registered Geologist whose signature appears hereon.

This report was prepared in general accordance with the accepted standard of practice that exists in Northern California at the time the investigation was performed. Judgments leading to conclusions and recommendations are generally made with an incomplete knowledge of the conditions present. More extensive studies, including additional environmental investigations, can tend to reduce the inherent uncertainties associated with such studies.

Our firm has prepared this report for the Client's exclusive use for this particular project and in accordance with generally accepted professional practices within the area at the time of our investigation. No other representations, expressed or implied, and no warranty or guarantee is included or intended.

This report may be used only by the client and only for the purposes stated within a reasonable time from its issuance. Land use, site conditions (both on-site and off-site) or other factors may change over time, and additional work may be required with the passage of time. Any party other than the client who wishes to use this report shall notify ERAS of such intended use. Based on the intended use of report, ERAS may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release ERAS from any liability resulting from the use of this report by any unauthorized party.

Sincerely,
ERAS Environmental, Inc.

1.0 INTRODUCTION

The following report presents the results of the collection of soil and groundwater samples to further characterize the lateral and vertical extent of contamination at a commercial site located at 1091 Calcot Place in Oakland, California (the "Property").

Previous subsurface investigations conducted by ERAS on the Property identified contamination including elevated concentrations of petroleum hydrocarbons quantified as diesel and oil range organics (TPH-dro¹, and TPH-oro).

This report was prepared to further investigate contamination in the area of the fuel oil underground storage tanks (USTs) and where "burners" (possible furnaces) were located so that an environmental site case closure can be obtained from the Alameda County Department of Environmental Health (ACDEH).

The Property is located on the northwest side of Calcot Place near the intersection of East 11th Street and 23rd Avenue in the western portion of the City of Oakland. The Property consists of an approximately 1.17-acre rectangular shaped parcel of land that is improved with an approximately 1,300-square foot one story commercial building and associated paved areas. The Property is currently used for a parking lot/storage yard.

The location of the Property is shown on **Figure 1**. The layout of the Property is shown on **Figure 2**.

1.1 BACKGROUND

The history and the description of the Property is based on information obtained during a Phase 1 Environmental Site Assessment conducted by ERAS in 2014.

The Property is in an area of mixed commercial and residential land uses. The Property was occupied by a parking lot for live/work lofts at 1091 Calcot Place and storage and repair of personal automobiles and vehicles formerly used in movie production.

To the northeast of the Property was Southern Pacific Railroad. To the southeast was Calcot Place and across the street was a commercial building at 1092 Calcot Place. To the west of the Property was the Nimitz Freeway (I-880). The Property also wrapped around the 1091 Calcot Building which according to signs was formerly occupied by California Cotton Mills. The building was indicated to have been built in 1883. The former California Cotton Mill building is now occupied by live/work lofts.

¹ TPH-gro, TPH-dro, and TPH-oro are methods that compare analytical results to standards for gasoline, diesel, and motor oil, respectively. Therefore, analytical results are estimates of quantities based on what would be expected for the range of hydrocarbon results for the standard. Gasoline range organics (gro) are those hydrocarbon compounds that are in the range of C6 to C10, diesel range organics (dro) are those hydrocarbon compounds that are in the range of C10 to C23, and oil range organics (oro) are those hydrocarbon compounds that are in the range of C18 to C36. There can be overlap in reporting methods as well as identification of compounds that fall within the standard that may not necessarily be derived from gasoline, diesel, or oil.

The Property contained parking and storage space along with one small building of brick construction on a concrete slab foundation. The building was located on the far northwestern corner of the Property. The building was used for storage of vehicles, parts, and various other items for the restoration of vehicles.

The yard area was divided into two areas. The southeastern-most portion was an asphalt paved parking area for the live/work lofts at 1091 Calcot Place. No leaks or spills were observed in this area other than *di minimis* oil spotting from parked vehicles. None of the oil spotting was noted to be in the area of major cracks or drains. The northeastern portion of the Property was an asphalt paved yard area used for the storage of vehicles, storage containers, storage trailers, and various other automotive items.

On a 1911 Sanborn Fire Insurance map three furnaces and two underground oil storage tanks were indicated to have been present along the northeastern side of the Property. No records were found during this investigation to document their removal or if any sampling was performed.

Septic systems, drywells, monitoring wells or evidence of subsurface investigations were not observed on the Property by ERAS. No evidence of aboveground storage tanks (ASTs) or underground storage tanks (USTs) were observed on the Property by ERAS. No evidence of leakage, spillage, and dumping of regulated material was observed on the Property by ERAS.

1.2 PREVIOUS SUBSURFACE INVESTIGATIONS

2014 - ERAS Environmental conducted a subsurface investigation of the Property on December 23, 2014 that included the drilling of three soil borings B-1 through B-3, and the collection of groundwater samples. The soil borings were drilled directly in the area of the former USTs, their purpose was to collect samples from beneath the USTs, estimated to be approximately 10-12 feet below ground surface (bgs) to assess possible environmental impact from their previous use. Groundwater was encountered at depths of approximately 3-11 feet bgs so groundwater samples were collected in lieu of the soil samples. The results of the analysis of these samples are summarized on **Table 2** for groundwater.

The area of the former USTs was screened using a magnetometer and ground penetrating radar (GPR) to determine if the USTs had been removed. The USTs were determined to have been removed.

The results of the investigation indicated the former presence of the USTs on the Property have impacted the subsurface environmental conditions beneath the Property at concentrations above the Regional Water Quality Control Board (RWQCB) Environmental Screening Limit (ESLs). ERAS concluded that additional investigations would likely be needed to characterize the nature and extent of the petroleum hydrocarbon contaminants detected as well as typical semi-volatile organic compounds (SVOCs) found in fuel and oil blends.

ERAS recommended the report be provided to the Alameda County Department of Environmental Health (ACDEH) and the RWQCB for further oversight.

2015 - The ACDEH requested a work plan for further investigation in correspondence dated April 14, 2015. ERAS prepared a work plan dated August 31, 2015 in response to the request by ACDEH. The work plan was approved by the ACDEH on November 20, 2015. The ACDEH requested that soil samples be collected from depth intervals of 0-5 feet bgs and 5-10 feet bgs.

2016 - ERAS Environmental conducted a subsurface investigation of the Property on January 20, 2016 that included the drilling of four soil borings (B-4 through B-7) for the collection of soil and groundwater samples. The soil borings were drilled to characterize the vertical and lateral extent of the contamination associated with the former USTs.

2017 - On March 1, 2017 ERAS submitted a work plan (ERAS, 2017a) requested by Ms. Karel Detterman of ACDEH (ACDEH, 2017a) in a letter dated January 20, 2017. The work plan was prepared to further investigate the nature and extent of hydrocarbons near the former fuel oil USTs and in the area of the former burners by the drilling of 10 additional soil borings (B-8 through B-16 and EW-1). A Work Plan Addendum was subsequently submitted dated May 16, 2017 (ERAS, 2017b) the Work Plan Addendum was conditionally approved by ACDEH in the letter dated July 21, 2017 (ACDEH, 2017b).

The results of the analysis of soil samples are summarized on **Table 1** and the results of groundwater sample analyses are summarized on **Table 2**.

Soil - The soil samples from 0-5 and 5-10 feet bgs were analyzed for TPH-gro, TPH-dro, and TPH-oro by EPA Method 8015, VOCs including naphthalene by EPA Method 8260B, SVOCs by EPA Method 8270, along with PAHs by SIM Mode.

The groundwater samples from the borings were analyzed for TPH-gro, TPH-dro, and TPH-oro by EPA Method 8015, and VOCs including naphthalene by EPA Method 8260B.

Shallow soil, 3.5-4 feet bgs, was found to contain TPH-dro above the ESL (230 mg/Kg) only in boring B-11 (230 & 270 mg/Kg, depending on utilization of silica gel cleanup). Shallow soil, 3.5-4 feet bgs, was found to contain phenols above the ESL (0.076 mg/Kg) at concentrations which ranged from 0.30-0.59 mg/Kg. The shallow soil samples collected from 3.5 to 4 feet were also found to contain benzo(a)pyrene above the ESL (0.016 mg/Kg) at concentrations which ranged from 0.091 to 0.77 mg/Kg. Benzo-a-anthracene was detected in the shallow soil samples above the ESL (0.16 mg/Kg) at concentrations ranging from 0.2 to 0.57 mg/Kg. Benzo-b-fluoranthene was detected in the shallow soil samples above the ESL (0.16 mg/Kg) at concentrations ranging from 0.19 to 0.57 mg/Kg).

The deeper soil interval (7.5-8 feet bgs; and 9.5-10 ft bgs for B-4), yielded fewer positive results for the VOCs and SVOCs except in boring B-7 and to a lesser degree B-8. In particular, the sample collected from boring B-7 contained concentrations of TPH-dro, naphthalene, 2-methylnaphthalene, benzo-a-anthracene and benzo-b-fluoranthene which exceeded their respective ESLs. B-8 also yielded benzo-a-anthracene and benzo-a-pyrene results above their respective ESLs.

Groundwater – Most of the groundwater samples were analyzed for the presence of TPH-dro

and TPH-oro using silica gel cleanup (SGC), some were also analyzed for these contaminants without silica gel cleanup. The analyses indicate only minor difference between SGC and non-SGC results for TPH-dro except in Boring B-11. SGC and non-SGC results were more significant for TPH-oro as shown on **Table 2**.

Based on the results of this investigation, the highest concentrations of TPH-dro & TPH-oro in groundwater were in the area of B-3 (TPH-dro at a concentration of 15,000 micrograms per liter ($\mu\text{g/L}$) and TPH-oro at 23,000 $\mu\text{g/L}$ and appear to attenuate significantly in all directions except to the southeast as indicated by the result in Boring B-5. Note groundwater was not encountered in Boring B-10 to the southeast of B-5. Concentrations of TPH-dro with SGC in Boring B-11, beyond B-10 to the southeast, were less than the detection limit and significantly lower in B-11.

Groundwater flow is estimated to be variable from the southwest to the northwest (see **Section 2** below). The highest concentration of TPH-dro with SGC away from B-3 is 6,100 $\mu\text{g/L}$ at B-2 and then 6,000 $\mu\text{g/L}$ at B-5. The results for B-4, B-6, B-7 B-8 and B-9 suggest a rapid decay in TPH-dro and TPH-oro concentrations further away including in a down-gradient direction. The distribution of TPH-dro in groundwater is shown on

Note additional evaluation of the analytical results are provided below in **Section 3.3**.

2.0 REGIONAL GEOLOGY/HYDROLOGY

The Property is in the southern part of the City of Oakland in the San Francisco Bay area. The San Francisco Bay area occupies a broad alluvial valley that slopes gently northward toward Oakland Bay and is flanked by alluvial fans deposited at the foot of the Diablo Range to the east and the Santa Cruz Mountains to the west. The northern part of the valley is called the Santa Clara Valley. Surface topography in the immediate vicinity of the Property is gently sloping down to the southwest towards tidally influenced Brooklyn Basin Tidal Canal.

The Property is at an elevation of approximately 15 feet above Mean Sea Level according to the United States Geological Survey (USGS) Oakland East Quadrangle California 7.5 Minute Series topographic map.

Materials underlying the site are unconsolidated deposits of near shore and beach sediments, deposited in Oakland Bay at higher sea level stands. At shallow depths beneath these sediments are chert, greywacke, serpentine and shale bedrock that are a part of the Cretaceous to Jurassic-aged Franciscan Formation. Bedrock is exposed to the west and north on the upland surfaces.

The subject site is located on the San Francisco Bay Plain in the northernmost part of the Santa Clara Valley Groundwater Basin, (DWR, 1967), the surface of which slopes gently down toward the Brooklyn Basin Tidal Canal.

The regional groundwater flow follows the topography, moving from areas of higher elevation to areas of lower elevation. The regional groundwater flow direction in the area of the Property is estimated to be toward the southwest toward the Brooklyn Basin Tidal Canal. At the Exxon Station at 2200 E 12th, approximately 600 feet to the north, the depth to water was reported to be approximately 4.2 to 16.5 feet below ground surface (bgs) with a flow direction to the west (ACDEH, 2012). At the Credit World Auto Sales site at 2245 International Boulevard, approximately 750 feet to the northeast, the depth to water was reported to be approximately 1.38-18.25 feet bgs with a flow direction from southwest to northwest (ACDEH, 2017).

Based on the subsurface investigations conducted by ERAS, the subsurface vadose zone lithology encountered consisted of silty clay underlain by the water bearing zone which consisted of silt and silty sand. Groundwater was encountered at depths ranging from approximately 3 feet in the former UST location to approximately 15 feet bgs. Boring B-10 was an exception in that no groundwater was encountered to the total depth of 24 feet bgs.

3.0 WORK PERFORMED

3.1 SCOPE OF INVESTIGATION

The scope of work conducted by ERAS for this investigation was as follows.

- Obtained a permit for drilling from the Alameda County Public Works Department (ACPWD).
- Cleared the boring locations for the presence of utilities by notifying Underground Service Alert and employing a private underground locating/clearance service.
- Advanced ten borings using a direct push sample rig. The borings in the location of the former burners were advanced to a depth of 12 feet bgs. The remaining borings were advanced to approximately 24 feet. The borings were continuously logged by a field geologist.
- Collected a selected soil sample from the depth intervals of 3.5-4 and 7.5-8 feet bgs at each of the borings.
- Collected a groundwater sample from each boring and from the well installed.
- Installed a groundwater well in the location of the former USTs near the boring which contained the highest concentration of the contaminants of concern (B-3). The well was set to a depth of 24 feet bgs. The screen interval was based on the lithology observed during drilling and the groundwater table encountered.
- Collected soil samples from the tank pit in the location of extraction well EW-1 from the depth intervals of 3.5-4 and 7.5-8 feet bgs for analysis.
- Developed well EW-1 and collected a groundwater sample for laboratory analysis.
- Analyzed the groundwater samples for TPH-gro, TPH-dro, and TPH-oro by EPA Method 8015, and VOCs including naphthalene by EPA Method 8260B.
- Analyzed the soil samples for TPH-gro, TPH-dro, and TPH-oro by EPA Method 8015, VOCs including naphthalene by EPA Method 8260B, SVOCs by EPA Method 8270, and for PAHs by SIM Mode.
- Prepared this report summarizing the field procedures and results of the investigation.

3.2 BORING LOCATIONS AND SAMPLING

ERAS procured a drilling permit from the ACPWD prior to drilling activities which is included in **Appendix A**. Ten 2.5-inch diameter soil borings were drilled using a hydraulic push sampling rig by ECA of Aptos, California on August 30-31, 2017. One soil boring was over drilled with 10-inch augers to convert the boring to extraction well EW-1. The locations of the borings and well are shown on **Figure 2**. The Standard Operating Procedures for direct-push sampling are

included in **Appendix B**. The Standard Operating Procedures for the installation, development, and sampling of a groundwater well are also included in **Appendix B**.

ERAS advanced ten soil borings on the Property (designated B-8 through B-16, and EW-1). The boring locations were proposed to further characterize the extent of contaminants in soil and groundwater that were previously detected.

Soil Borings – Soil borings were drilled in the following locations:

- Boring B-8 was located at the western portion of the Property adjacent to Interstate 880 downgradient of previous boring B-6 (January 20, 2016) which contained concentrations of TPH exceeding the ESLs.
- Boring B-9 was located approximately 100 feet southeast of boring B-8 in the current vehicle storage area down-gradient of previous boring B-5 (January 20, 2016) which contained concentrations of TPH exceeding the ESLs.
- Boring B-10 was located at the southwest corner of the Property adjacent to an underground fire suppression line.
- Boring B-11 was located approximately 75 feet to the southeast of boring B-10 in the parking area of the Calcot Lofts adjacent to an underground fire suppression line.
- Boring B-16 was in the former USTs area adjacent to boring B-2 (January 20, 2016). This boring was approximately 10 feet to the west of the proposed boring location due to multiple refusals during drilling.
- Boring EW-1 was located adjacent to boring B-3 (January 20, 2016) approximately 4 feet from the proposed boring location also due to refusal.

The borings were advanced to a depth of approximately 24 feet bgs.

Borings B-12 through B-15 were in the northeast corner of the Property in the former burners (furnaces) area and were advanced to a depth of approximately 12 feet.

- Boring B-12 was located approximately 55 feet to the northeast of boring B-6 (January 20, 2017).
- Borings B-13, B-14, and B-15 were located to the northeast with approximate 25-foot intervals between borings. Note Borings B-14 and B-15 were moved approximately 10 feet to the east of the proposed boring locations due to refusal at the proposed locations.

Soil was continuously cored for lithologic logging and monitored using an organic vapor meter (OVM) for indications of contamination. The soil cores were logged by ERAS geologist Greg Munsell.

Well Installation - The soil boring EW-1 was drilled with a ten-inch auger for the installation of a four-inch diameter extraction well to a depth of approximately 24 feet bgs. The well was constructed of 4-inch inside diameter schedule 40 polyvinyl chloride (PVC) pipe. The screened interval was completed with 0.010-inch slots from 6 feet to 24 feet bgs, with a one-foot bentonite seal from 5 to 6 feet. The remaining annulus was grouted with neat cement to the ground surface and the top-of-casing was secured with a waterproof, locking cap. The wellhead was finished with a flush-mounted, traffic-rated, waterproof well vault surrounded by concrete. Well completion details are included on boring log for EW-1 in **Appendix C**.

Following well installation, the well was developed by surging with a 3-inch diameter bailer and water pumped from the well for temporary storage in 55-gallon drums. After removal of approximately 300 gallons of groundwater, the well was sampled for laboratory analysis. A Department of Water Resources Well Completion Report is included in **Appendix E**. Well development, and groundwater sampling data are included as **Appendix F**.

Well Elevation Survey - The well was surveyed by CSS Environmental, Inc. of Novato on September 19, 2017 for elevation of the top of casing with respect to mean sea level (MSL), and for horizontal position in latitude, and longitude to the specifications of the California Geotracker Internet Database. The well was located at latitude 37.7825282, longitude -122.2387249, and at an elevation of 15.99 feet above MSL. The surveyor's report is included in **Appendix E**. Results of the survey were uploaded to Geotracker. The upload confirmation forms are included in **Appendix E**.

Subsurface Lithology - The subsurface lithology encountered consisted of fill including brick, concrete rubble, and gravel to a depth of 1-7 feet bgs which was underlain by silty clay to a depth of 14.5-15 feet bgs. The groundwater bearing zone consisted of a thin silty sand or clayey silt zone at 14.5-15 feet bgs underlain by stiff silty clay. Details of subsurface conditions are provided in the soil boring logs in **Appendix C**.

No evidence of petroleum hydrocarbon impact was observed in the form of strong odors, discoloration or elevated OVM readings in borings B-8, B-9, B-12, B-13, B-14, B-15, and EW-1. Borings B-10, B-11, and B-16 all yielded some limited evidence of petroleum hydrocarbons in the form of positive low PID readings (B-10: 3.2 to 10.4 units; B-11: 2.7 units; B-16 2.1 to 11.1 units), odor (B-11: minor; B-16: mild to slight) and discoloration (B-16: very dark greenish gray vs. yellowish brown).

A soil sample was collected from the depth ranges of 0-5 feet and 5-10 feet bgs from each boring. Groundwater samples were collected from borings B-8, B-9, B-11, and EW-1. No groundwater samples were collected from Borings B-12 through B-15 since these borings were drilled to check for surface spillage from the former burners and were not drilled down to the depth of the saturated zone. The saturated zone was not encountered in Boring B-10. Boring B-16 did not yield enough water to collect a sample despite the targeted zone being wet.

The soil and groundwater samples were kept chilled pending transport under chain-of-custody procedures to a California certified environmental analytical laboratory.

Soil cuttings, decontamination water and purged groundwater were stored temporarily at the subject site in 55-gallon drums pending disposal at an appropriate facility.

3.3 ANALYTICAL RESULTS

Soil samples were analyzed for the following.

- TPH-gro, TPH-dro, and TPH-oro by EPA Method 8015
- VOCs including naphthalene by EPA Method 8260B
- SVOCs by EPA Method 8270
- PAHs by SIM Mode.
- Samples for TPH-dro, and TPH-oro were analyzed with and without silica gel cleanup.

Groundwater samples were analyzed for the following.

- TPH-gro, TPH-dro, and TPH-oro by EPA Method 8015
- VOCs including naphthalene by EPA Method 8260B.
- SVOCs by EPA Method 8270C.

Note the results of soil analyses are summarized on Table 1, the results of groundwater analyses are summarized on Table 2.

Soil

TPH-gro - No concentrations of TPH-gro were detected at concentrations exceeding the Tier 1 ESLs.

TPH-dro - In the samples from 3.5-4 feet bgs, concentrations of TPH-dro ranged between 1.0 mg/Kg to 230 mg/Kg with silica gel cleanup (SGC) and 0.86 mg/Kg to 270 mg/Kg without SGC. In samples from 7.5-8 feet bgs concentrations ranged between 0.93 mg/Kg to 69 mg/Kg with SGC and 1.5 to 87 mg/Kg without SGC. The extent of TPH-dro in soil in the depth interval of 3.5-10 feet is shown on **Figure 3** with the results of the samples shown in "with" and "without" SGC.

TPH-oro - In samples analyzed at 3.5-4 feet bgs concentrations of TPH-oro ranged between 2.8 mg/Kg to 3,130 mg/Kg with SGC and 5.5 mg/Kg to 4,670 mg/Kg without SGC. In samples analyzed at 7.5-8 feet bgs concentrations of TPH-oro ranged from 7 mg/Kg to 430 mg/Kg with SGC and 5.2 mg/Kg to 640 mg/Kg without SGC. Note that none of the samples collected contained TPH-oro above the ESL. The extent of TPH-oro in soil in the depth interval of 3.5-10 feet is shown on **Figure 4** with the results of the samples shown in "with" and "without" SGC.

VOCs - Concentrations of 1,2-Dibromo-3-chloropropane were detected in the 3.5-4-foot sample from boring B-10 at 0.080 mg/Kg, and in the 3.5-4-foot sample from boring B-11 at concentration 0.0076 mg/Kg, above the ESL of 0.0045 mg/Kg. Naphthalene was detected in the 7.5-8-foot sample from boring B-7 at 2.0 mg/Kg, above the ESL of 0.033 mg/Kg. A concentration of 2-methylnaphthalene was detected in this sample at 8.3 mg/Kg, above the ESL of 0.25 mg/Kg. Note this boring (B-7) is located at the Property and railroad line boundary. Based on the lack of concentrations of these constituents in soil and groundwater samples from

borings within the former UST area, a source at the rail line cannot be ruled out at this time.

SVOCs – at a depth of 3.5-4 feet bgs benzo(a)anthracene was detected in boring B-4 at 0.57 mg/Kg, in B-11 at 0.2 mg/Kg and B-16 at 0.23 mg/Kg, above the ESL of 0.16 mg/Kg. At 7.5-8 feet bgs B-7 yielded a concentration of 0.5 mg/Kg and B-8 yielded a concentration of 0.25 mg/Kg.

At a depth of 3.5-4 feet bgs benzo(a)pyrene was detected in boring B-4 at 0.77 mg/Kg, in B-10 at 0.016 mg/Kg, in B-11 at 0.43 mg/Kg and in B-16 at 0.19 mg/Kg, above the ESL of 0.016 mg/Kg. At a depth of 7.5-8 feet bgs, only B-8 (0.091 mg/Kg) yielded benzo(a)pyrene above the ESL.

At a depth of 3.5-4 feet bgs benzo(b)fluoranthene was detected in boring B-4 at 0.57 mg/Kg, in B-11 at 0.2 mg/Kg and in B-16 at 0.19 mg/Kg, above the ESL of 0.16 mg/Kg. At a depth of 7.5-8 feet bgs, only B-7 (0.5 mg/Kg) yielded benzo(b)fluoranthene above the ESL.

Groundwater

No concentrations of TPH-gro were detected above the MDL in the groundwater samples collected during this investigation.

Note groundwater was only encountered in Borings B-8, B-9, B-11 and EW-1.

TPH-dro – TPH-dro analyzed without SGC, was detected in Boring B-8 at a concentration of 110 µg/L above the ESL of 100 µg/L. Without SGC concentrations ranged from 160 µg/L in B-8 to 1,700 µg/L in B-11. The extent of TPH-dro in groundwater is shown on **Figure 5**.

TPH-oro – TPH-oro analyzed without SGC, was detected in Boring B-8 at a concentration of 710 µg/L and in B-11 above the ESL of 100 µg/L. Without SGC concentrations ranged from 350 µg/L in EW-1 to 1,900 µg/L in B-11. The extent of TPH-oro in groundwater is shown on **Figure 6**.

VOCs – The only VOC detected above the ESL was hexachloroethane in boring B-9 at 0.44 µg/L which exceeds the current ESL of 0.33 µg/L.

SVOCs -

Bis(2-chloroisopropyl)ether was detected in borings B-8 and B-9 above the ESL of 0.36 µg/L at concentrations of 0.50 and 0.60 µg/L, respectively.

2,4-dinitrotoluene was detected in borings B-8, B-9 and B-11 above the ESL of 0.24 µg/L at concentrations from 0.24 to 0.54 µg/L.

Benzo(a)anthracene was detected in borings B-8, B-9, B-11 and EW-1 above the ESL of 0.027 µg/L at concentrations from 0.25 to 0.97 µg/L.

Benzo(a)pyrene was detected in boring B-9 above the ESL of 0.014 µg/L at a concentration of 0.22 µg/L.

Benzo(b)fluoranthene was detected in borings B-8 and B-9 above the ESL of 0.012 µg/L at concentrations of 0.24 to 0.54 µg/L, respectively.

Benzo(g,h,i) perylene was detected in borings B-8 and B-9, above the ESL of 0.1 µg/L at concentrations of 0.49 to 0.24 µg/L, respectively.

Chrysene was detected in borings B-8 and B-9 above the ESL of 0.049 µg/L at concentrations of 0.69 to 0.32 µg/L, respectively.

4.0 UPDATED CONCEPTUAL SITE MODEL

A summary of the current conceptual site model, based on the subsurface investigations, is included on **Table 3**.

4.1 HYDROGEOLOGIC SETTING

The following narrative reflects the update to the CSM. A more complete summary is provided in the updated SCM **Table 3**.

CSM Element: Geology and Hydrogeology; CSM Sub-Element: Site; Description: **Geology**: The subsurface of the Property contains approximately 1-8 feet of fill that includes brick and rubble. Native sediment beneath the fill consists of silty clay underlain by the water bearing zone which consisted of silt and silty sand in a layer approximately 1-2 feet thick. Silty clay extends to a depth of at least 24 feet.

CSM Element: Geology and Hydrogeology; CSM Sub-Element: Site; Description: **Hydrogeology**: Groundwater at the Property is likely contained in thin sand stringers within the silty clay. Groundwater has been encountered at depths of approximately 3-11 feet in the former UST area and may comprise perched groundwater. The shallow groundwater zone is located at depths of approximately at depths of approximately 11-18 feet. The zone appears to be somewhat discontinuous as it was missing in B-10. Boring B-16 did not yield enough water to sample despite the targeted zone being wet. The main shallow water-bearing zone appears to be in thin clayey sand, sand, clayey silt, and, silty sand units interbedded within clay.

Groundwater is generally under water-table conditions, but may be locally confined by clay in the upper portion of the water-bearing zone. The base of the shallow water bearing zone appears to be approximately 14 feet bgs and is underlain by a stiff clay which extends to at least 24 feet bgs.

4.2 SUMMARY OF EXTENT OF CONTAMINATION

The previous historical subsurface investigations indicated the main source of contamination is in or very near the former fuel oil USTs. Because of the high concentrations of petroleum hydrocarbons in this area, a groundwater extraction well was installed to remove the secondary source of contamination. Approximately 300 gallons of groundwater was pumped from the extraction well and a sample of groundwater contained concentrations of petroleum hydrocarbons approximately 2 orders of magnitude less than the concentrations in the initial

borings drilled in this area in 2015.

Another potential source of contamination were the former furnaces that may have been fueled from the nearby fuel oil USTs. Results of soil samples from these areas (Borings B-12 through B-15 did not indicate the presence of concentrations of contaminants above ESLs. The furnaces are not considered a source of contamination.

Soil

Petroleum hydrocarbons have been detected at high concentrations in or near the source area of the former fuel oil USTs. The extent of TPH-dro has been characterized to at or near ESLs. The primary exception is that at B-7 - northeast of the source - the extent of contamination above the ESL of 100 mg/kg is not known and it is not technically feasible to continue exploration in this direction under the railroad operated by Southern Pacific. The basis for the lack of technical feasibility is twofold: (i) most railroad companies are strongly resistant to covenants requiring access to rail road parcels; and (ii) any lateral extent characterization under railroads would be complicated by potential comingling of contaminants from the railroad use history.

Moreover, the gradient for groundwater is estimated to be to westerly and the hydrocarbons detected in B-7 are unlikely to migrate a great distance onto the parcel to the north based on the attenuations observed in the directions to the northwest, west, southwest and south.

TPH-oro has not been detected in soil samples above ESLs.

VOCs (naphthalene and 2-methylnaphthalene) were detected in one soil sample at 5-10 feet and appears to be limited in extent on the Property.

Shallow soil on the Property appears to have been impacted by phenol and a few other SVOCs at concentrations above ESLs. The widespread distribution of these at similar concentrations with little evidence of attenuation from a potential source indicates the source of these is incidental spillage from storage of chemicals or from the fill that has been placed on the Property and are not likely associated with a release from the former USTs. This is also supported by the lack of positive SVOC results above the ESLs in the soil samples collected at EW-1 (in the heart of the presumed source).

Groundwater

Based on the results of this investigation the bulk of the petroleum hydrocarbon contamination which exceeds the ESLs appears to be limited to the area of the former UST and nearby area along the railroad line. Approximately 300 gallons of groundwater was removed from the source area by pumping from extraction well EW-1. The extent of the contamination in groundwater has been mostly adequately characterized except for the groundwater in B-8 and B-11. The extent of TPH-dro and TPH-oro in groundwater is shown on **Figures 5 and 6**, respectively.

The extent of volatile constituents in groundwater appears to be limited. Naphthalene was detected only in B-7. Boring B-7 also contained naphthalene in the soil.

Groundwater from the borings that were sampled and analyzed for SVOCs indicated the presence of several constituents above the ESL, however these detections were scattered over a wide area at locations away from the former USTs and may represent background concentrations from incidental spillage from storage of chemicals or from the fill that has been placed on the Property and are not likely associated with a release from the former USTs.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the investigations, the highest concentrations of TPH-dro & TPH-oro in soil and groundwater are centered in the area of B-3 in the area of the former USTs and attenuate rapidly away from this location. Based on EW-1 groundwater sample results, contaminated groundwater that was encountered in the source area in 2014 appears to have been remediated and much lower concentrations currently remain.

The bulk of the TPH contamination associated with the former USTs is limited in extent and has been sufficiently characterized in the down-gradient direction. The widespread distribution of various other contaminants of concern at similar concentrations suggests a non-point-source for these contaminants of concern. It is possible, based on construction debris waste observed in some of the borings, that the source of contaminants may be the historic fill. This conclusion is supported by the fact that the frequency of positive results for SVOCs is correlated with the thickest observed layers of construction debris as shown in the boring logs for B-7 and B-8. Both the groundwater and soil detection frequencies are associated positively with B-7 and B-8. Therefore, it is reasonable to conclude that the fill that has been placed on the Property is a likely non-point source for SVOCs and is not associated with a release from the former USTs.

Based on the current site use, the location of the site in an historic industrial area between the Southern Pacific Railroad and Highway 880 and the widespread distribution of contaminants in fill material, further investigation does not appear warranted. The area of the Property is not likely to use groundwater for drinking water.

ERAS recommends that this site be considered for low threat case closure and that ACDEH be consulted for the best path forward to this end. Moreover, based on the technical obstacles to the southwest and northeast of the Property, ERAS recommends that further characterization under the railroad lines or under the Nimitz Freeway (I-880) not be undertaken.

TPH-dro = Total petroleum hydrocarbons quantified as diesel range organics

TPH-oro = Total petroleum hydrocarbons quantified as oil range organics

SGC = analysis performed using silica gel cleanup

MDL = Laboratory method detection limit RL = Reporting Limit

¹ Naphthalene concentration was detected at 1.4 µg/L (ESL 0.17 µg/L)

Sample contained hexachloroethane at 0.44 µg/L (ESL 0.33 µg/L)

ESL = Tier 1 Environmental Screening Limit (2016)

Bold face type indicates reported value above the ESL

< symbol indicates analyte was not detected above the reporting limit for the analyte

TABLE 3 - CONCEPTUAL SITE MODEL
1091 Calcot Place, Oakland

CSM Element	CSM Sub-Element	Description	Potential Data Gap(s)
Geology and Hydrogeology	Regional	The Property is in the southern part of the City of Oakland in the San Francisco Bay area. The San Francisco Bay area occupies a broad alluvial valley that slopes gently northward and is flanked by alluvial fans deposited at the foot of the Diablo Range to the east and the Santa Cruz Mountains to the west. Surface topography in the immediate vicinity of the Property is gently sloping down to the northwest towards Airport Channel. The Property is at an elevation of approximately 15 feet above Mean Sea Level according to the United States Geological Survey (USGS) Oakland East Quadrangle California 7.5 Minute Series topographic map. Materials underlying the site are unconsolidated deposits of near shore and beach sediments, deposited in Oakland Bay at higher sea level stands. At shallow depths beneath these sediments are chert, greywacke, serpentine and shale bedrock that are a part of the Cretaceous to Jurassic-aged Franciscan Formation. Bedrock is exposed to the east-northeast on the upland surfaces. The subject site is located on the San Francisco Bay Plain in the northernmost part of the Santa Clara Valley Groundwater Basin, (DWR, 1967), the surface of which slopes gently down toward west. The regional groundwater flow follows the topography, moving from areas of higher elevation to areas of lower elevation. The regional groundwater flow direction in the area of the Property is estimated to be toward the west toward the Brooklyn Basin.	None
	Site	Geology: The subsurface of the Property contains approximately 1-8 feet of fill that includes brick and rubble. Native sediment beneath the fill consists of silty clay underlain by the water bearing zone which consisted of silt and silty sand in a layer approximately 1-2 feet thick. Silty clay extends to a depth of at least 24 feet.	None
		Hydrogeology: Groundwater at the Property is likely contained in thin sand stringers within the silty clay. Groundwater has been encountered at depths of approximately 3-11 feet in the former UST area and may comprise perched groundwater. The shallow groundwater zone is located at depths of approximately 11-18 feet. The zone appears to be somewhat discontinuous as it was missing in B-10 and B-16.	None
Surface Water Bodies	--	The closest surface water bodies are the Brooklyn Basin, a portion of San Francisco Bay which was located approximately 1/4 of a mile to the west of the Property.	None
Nearby Wells	--	A well survey was performed that identified a single water supply well located approximately 3,200 feet to the southeast.	None
CSM Element	CSM Sub-Element	Description	Potential Data Gap(s)
Constituents of Concern	--	Constituents of concern include petroleum hydrocarbons quantified as diesel and oil range organics (TPH-dro, and TPH-oro). The highest concentrations of petroleum hydrocarbons were within or close to the former fuel oil UST area.	None
Potential Sources	On-site	The Property formerly contained two USTs used to store fuel oil that were previously investigated. Sanborn Fire Insurance Maps showed 4 furnaces located close to the northwest end of the Property.	None
		There is no record of the removal of the USTs but a geophysical survey in the area of the former USTs indicated their absence. A total of four soil borings have been drilled within the area of the former USTs.	None
CSM Element	CSM Sub-Element	Description	Potential Data Gap(s)
Nature and Extent of Environmental Impacts	Extent in Soil, TPH-dro	TPH-dro has been detected at concentrations at or above the ESL of 230 milligrams per kilogram (mg/Kg) only in two locations, in Boring B-7 close to the former USTs and rail line and in B-11, toward the southeast end of the Property.	None
	Extent in Soil, TOG/TRPH	TPH-oro was not detected in concentrations above the ESL in any of the samples collected at the Property.	None
	Extent in Soil, VOCs	VOCs appear to be minimal in magnitude and extent. Naphthalene and 2-methylnaphthalene were detected in deeper soil (5-10 feet depth interval) in Boring B-7.	None
	Extent in Soil, SVOCs	SVOCs were detected in shallow soil (0-5 foot depth interval) in borings near the former USTs (B-5, B-6 and B-7) at concentrations above the ESLs. The SVOCs included phenol, benzo(a)anthracene, benzo (a) pyrene and benzo (b) fluoranthene. SVOCs also were detected in the widely spaced borings B-4, B-10, B-11 and B-16 indicate the presence of SVOCs in shallow soil that may be the result of widespread surface spillage or from fill materials and are not likely associated with a release from the former USTs.	None
			None

TABLE 3 - CONCEPTUAL SITE MODEL
1091 Calcot Place, Oakland

	Extent in Soil, Metals	Metals detected to be present on the Property have included cadmium, chromium, lead, nickel, and zinc. None of the concentrations detected were found to be above the ESL for commercial areas where groundwater is considered a potential source of drinking water	None
Nature and Extent of Environmental Impacts	Extent in Groundwater, TPH-dro	Concentrations of TPH-dro from 6,100 to 15,000 micrograms per liter ($\mu\text{g}/\text{L}$) were detected in borings in or near the former USTs (B-2, B-3 and B-5). Concentrations outside of the general UST area were much lower and ranged from 110-180 $\mu\text{g}/\text{L}$, above the ESL of 100 $\mu\text{g}/\text{L}$.	None
	Extent in Groundwater, TOG/TRPH	Concentrations of TPH-oro from 180 to 23,000 micrograms per liter were detected in borings in or near the former USTs (B-2, B-3, B-5 and EW-1). Concentrations outside of the general UST area were much lower and ranged from 110-180 $\mu\text{g}/\text{L}$, above the ESL of 100 $\mu\text{g}/\text{L}$ except in B-11 that contained 1,700 $\mu\text{g}/\text{L}$.	None
	Extent in Groundwater, VOCs and SVOCs	Groundwater sampling has indicated the presence of naphthalene in groundwater in one boring along the northeastern Property boundary. Concentrations of SVOCs for the borings for which groundwater results are available indicate concentrations of SVOCs to the southeast and southwest of the former USTs. The similar and widespread concentrations of some of the SVOCs indicate a possible regional presence of background concentrations and are not likely associated with a release from the former USTs.	None
Nature and Extent of Environmental Impacts		The extent of petroleum hydrocarbons in groundwater appears to be in the area of the former USTs and has been defined except to the southeast past B-11.	None
Migration Pathways	Potential Conduits	Based on the drilling of 16 borings on the Property, no underground sanitary sewer, water, gas, or electrical lines are located on the Property. A fire suppression line is located along the entire northeast edge of the Property.	None
Potential Receptors/Risk	On-site	Potable water at the site currently is provided via municipal supply and will continue to be in the foreseeable future. As such, direct contact to groundwater is not contemplated.	None
Potential Receptors/Risk	Off-site	A well survey indicates only one water production well is located within 3,200 feet of the Property.	None

Works Requesting Permits:

Borehole(s) for Investigation-Environmental/Monitoring Study - 10 Boreholes

Driller: Environmental Control Associates - Lic #: 695970 - Method: DP

Work Total: \$265.00

Specifications

Permit Number	Issued Dt	Expire Dt	#	Hole Diam	Max Depth
W2017-0662	08/24/2017	11/27/2017	10	2.75 in.	24.00 ft

Specific Work Permit Conditions

1. Backfill bore hole by tremie with cement grout or cement grout/sand mixture. Upper two-three feet replaced in kind or with compacted cuttings. All cuttings remaining or unused shall be containerized and hauled off site. The containers shall be clearly labeled to the ownership of the container and labeled hazardous or non-hazardous.
2. Boreholes shall not be left open for a period of more than 24 hours. All boreholes left open more than 24 hours will need approval from Alameda County Public Works Agency, Water Resources Section. All boreholes shall be backfilled according to permit destruction requirements and all concrete material and asphalt material shall be to Caltrans Spec or County/City Codes. No borehole(s) shall be left in a manner to act as a conduit at any time.
3. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.
4. Applicant shall contact assigned inspector listed on the top of the permit at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.

Alameda County Public Works Agency - Water Resources Well Permit

5. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of \$500.00.
 6. Electronic Reporting Regulations (Chapter 30, Division 3 of Title 23 & Division 3 of Title 27, CCR) require electronic submission of any report or data required by a regulatory agency from a cleanup site. Submission dates are set by a Regional Water Board or by a regulatory agency. Once a report/data is successfully uploaded, as required, you have met the reporting requirement (i.e. the compliance measure for electronic submittals is the actual upload itself). The upload date should be on or prior to the regulatory due date.
 7. **NOTE:**
Under California laws, the owner/operator are responsible for reporting the contamination to the governmental regulatory agencies under Section 25295(a). The owner/operator is liable for civil penalties under Section 25299(a)(4) and criminal penalties under Section 25299(d) for failure to report a leak. The owner/operator is liable for civil penalties under Section 25299(b)(4) for knowing failure to ensure compliance with the law by the operator. These penalty provisions do not apply to a potential buyer.
 8. Prior to any drilling activities onto any public right-of-ways, it shall be the applicants responsibilities to contact and coordinate a Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits required for that City or to the County and follow all City or County Ordinances. It shall also be the applicants responsibilities to provide to the Cities or to Alameda County a Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.
 9. Permit is valid only for the purpose specified herein. No changes in construction procedures, as described on this permit application. Boreholes shall not be converted to monitoring wells, without a permit application process.

- Specific Work Permit Conditions**
1. Permittee shall assume entire responsibility for all activities and uses under this permit and shall indemnify, defend and save the Alameda County Public Works Agency, its officers, agents, and employees free and harmless from any and all expense, cost, liability in connection with or resulting from the exercise of this Permit including, but not limited to, properly damage, personal injury and wrongful death.
 2. Permittee, permittee's contractors, consultants or agents shall be responsible to assure that all material or waters generated during drilling, boring destruction, and/or other activities associated with this Permit will be safely handled, properly managed, and disposed of according to all applicable federal, state, and local statutes regulating such. In no case shall these materials and/or waters be allowed to enter, or potentially enter, on or off-site storm sewers, dry wells, or waterways or be allowed to move off the property where work is being completed.
 3. Prior to any drilling activities, it shall be the applicant's responsibility to contact and coordinate an Underground Service Alert (USA), obtain encroachment permit(s), excavation permit(s) or any other permits or agreements required for that Federal, State, County or City, and follow all City or County Ordinances. No work shall begin until all the permits and requirements have been approved or obtained. It shall also be the applicants responsibilities to provide to the Cities

Alameda County Public Works Agency - Water Resources Well Permit

or to Alameda County an Traffic Safety Plan for any lane closures or detours planned. No work shall begin until all the permits and requirements have been approved or obtained.

4. Compliance with the well-sealing specifications shall not exempt the well-sealing contractor from complying with appropriate State reporting-requirements related to well construction or destruction (Sections 13750 through 13755 (Division 7, Chapter 10, Article 3) of the California Water Code). Contractor must complete State DWR Form 188 and mail original to the Alameda County Public Works Agency, Water Resources Section, within 30 days. Include permit number and site map.
 5. Applicant shall submit the copies of the approved encroachment permit to this office within 10 days.
 6. Applicant shall contact assigned inspector listed on the top of the permit at least five (5) working days prior to starting, once the permit has been approved. Confirm the scheduled date(s) at least 24 hours prior to drilling.
 7. Wells shall have a Christy box or similar structure with a locking cap or cover. Well(s) shall be kept locked at all times. Well(s) that become damaged by traffic or construction shall be repaired in a timely manner or destroyed immediately (through permit process). No well(s) shall be left in a manner to act as a conduit at any time.
 8. Minimum surface seal thickness is two inches of cement grout placed by tremie.
 9. Minimum seal (Neat Cement seal) depth for monitoring wells is 5 feet below ground surface(BGS) or the maximum depth practicable or 20 feet.
 10. Copy of approved drilling permit must be on site at all times. Failure to present or show proof of the approved permit application on site shall result in a fine of \$500.00.
 11. Electronic Reporting Regulations (Chapter 30, Division 3 of Title 23 & Division 3 of Title 27, CCR) require electronic submission of any report or data required by a regulatory agency from a cleanup site. Submission dates are set by a Regional Water Board or by a regulatory agency. Once a report/data is successfully uploaded, as required, you have met the reporting requirement (i.e. the compliance measure for electronic submittals is the actual upload itself). The upload date should be on or prior to the regulatory due date.
-

APPENDIX B

Standard Operating Procedures

STANDARD OPERATING PROCEDURE – DIRECT PUSH BORINGS

SOIL CORING AND SAMPLING PROCEDURES

Prior to drilling, all boreholes will be hand dug to a depth of 4-5 feet below ground surface (bgs) to check for underground utilities.

Soil and groundwater samples are collected for lithologic and chemical analyses using a direct driven soil coring system. A hydraulic hammer drives sampling rods into the ground to collect continuous soil cores. As the rods are advanced, soil is driven into an approximately 2.5-inch-diameter sample barrel that is attached to the end of the rods. Soil samples are collected in sleeves inside the sample barrel as the rods are advanced. After being driven 4 to 5 feet into the ground, the rods are removed from the borehole. The sleeve containing the soil core is removed from the sample barrel, and can then be preserved for chemical analyses, or used for lithologic description. This process is repeated until the desired depth or instrument refusal is reached.

A soil core interval selected for analyses is cut from the sleeve using a pre-cleaned hacksaw. The ends of the tube are covered with aluminum foil or Teflon liner and sealed with plastic caps. The soil-filled liner is labeled with the bore number, sample depth, site location, date, and time. The samples are placed in bags and stored in a cooler containing ice. Soil from the core adjacent to the interval selected for analyses is placed in a plastic zip-top bag. The soil is allowed to volatilize for a period of time, depending on the ambient temperature. The soil is scanned with a flame-ionization detector (FID) or photo-ionization detector (PID).

All sample barrels, rods, and tools (e.g. hacksaw) are cleaned with Alconox or equivalent detergent and de-ionized water. All rinsate from the cleaning is contained in 55-gallon drums at the project site.

GROUNDWATER SAMPLING FROM DIRECT PUSH BORINGS

After the targeted water-bearing zone has been penetrated, the soil-sample barrel is removed from the borehole. Small-diameter well casing with 0.010-inch slotted well screen may be installed in the borehole to facilitate the collection of groundwater samples. Threaded sections of PVC are lowered into the borehole. Groundwater samples may then be collected with a bailer, peristaltic pump, submersible or other appropriate pump until adequate sample volume is obtained. Peristaltic pumps are not used in applications requiring a lift of greater than 1 foot of net head.

Groundwater samples are preserved, stored in an ice-filled cooler, and are delivered, under chain-of-custody, to a laboratory certified by the California Department of Health Services (DHS) for hazardous materials analysis.

BOREHOLE GROUTING FOR DIRECT PUSH BORINGS

Upon completion of soil and water sampling, boreholes will be abandoned with neat cement grout to the surface. If the borehole was advanced into groundwater, the grout is pumped through a grouting tube positioned at the bottom of the borehole.

STANDARD OPERATING PROCEDURE ---
GROUNDWATER MONITORING WELL CONSTRUCTION

The boreholes for monitor wells are usually drilled using a truck-mounted hollow-stem auger drill rig. The hollow-stem auger drilling method allows the well screen, casing and filter pack to be installed through the auger, thereby limiting boring cave-in during well installation. The borehole is logged by a geologist during drilling. Soil samples are collected for logging in a split spoon sampler lined with brass tubes at a maximum interval of five feet. Soil samples selected for chemical analyses are sealed at each end with Teflon sheets and plastic end caps, labeled and stored in a cooler with ice.

Well casing typically consists of flush-threaded schedule 40 PVC; however, schedule 80 PVC, Teflon, or stainless steel may be used depending on site conditions. The screened interval usually consists of machined slots for PVC and Teflon casing and continuous wire-wrap for stainless steel screen. The slot or screen size is selected by the geologist according to filter pack grain size and hydrogeologic formation characteristics. The most commonly used slot sizes are 0.010 inch and 0.020 inch. Either a threaded end cap or a PVC slip cap fastened with stainless steel screws is placed at the bottom of the casing. No solvents or cements are used to join casing sections.

The casing is set inside the hollow-stem auger and sand or gravel filter pack material is slowly poured into the annular space from the bottom of the boring to about 2 ft above the top of the well screen while withdrawing the auger. The filter pack grain size is selected by the geologist to conform to the formation grain size and estimated hydraulic conductivity. A 1-ft to 2-ft thick seal composed of hydrated bentonite pellets is placed above the filter pack to prevent grout from infiltrating into the filter pack. Portland cement grout used to seal the annular space from the top of the bentonite seal to about 6 inches below the surface. The grout is pumped under pressure through a pipe if the bentonite seal is below water. A lockable plastic expansion cap is placed at the top of the casing. Traffic-rated vault boxes are set in concrete around well heads in paved areas. Locking steel monument covers are usually installed over wellheads in unpaved areas.

STANDARD OPERATING PROCEDURE ---
GROUNDWATER MONITORING WELL DEVELOPMENT

Groundwater monitoring wells are developed after installation to improve well yield by removing fine material, including formation material or drilling mud, from the well casing, filter pack and boring annulus/formation interface. Fine material is also removed and soil grains aligned in the formation surrounding the well screen, thereby increasing porosity and hydraulic conductivity.

Prior to well development, the initial static water level is measured using a water level or interface probe. Standard procedure is to develop wells using a WaTerra surge block and an electric submersible pump. Well development may also be performed by hand using surge blocks and bailers, or by a truck-mounted development rig. The well is then surged along the entire screened interval using a surge block. This creates a back-washing effect that draws fine material from the formation and filter pack into the well casing and aligns the formation grains. Following surging, the well is then purged by using an electric submersible pump to remove fine suspended solids. The purging is continued until the purged water is relatively free of suspended solids and measurements of the groundwater pH, and conductivity have stabilized. "Stabilized" is defined as three consecutive readings within 10% of one another. Typically the amount of water purged is a minimum of 10 casing volumes. Data including well yield, purge time and rate, clarity, pH, and conductivity are recorded.

After purging is completed, water levels are measured and recorded while recovering to static level. All development equipment is either steam-cleaned or washed in non-phosphate detergent solution and double-rinsed with de-ionized (DI) water between wells.

The purged water is contained on-site in drums or tanks until properly disposed.

STANDARD OPERATING PROCEDURE

GROUNDWATER SAMPLING FROM MONITOR WELLS

Prior to groundwater sampling, a measurement is made of the static water level using a water level probe. At sites where the presence of separate-phase hydrocarbons is suspected, a product bailer or an interface probe is used to measure product thickness. The water level probe is cleaned with non-phosphate detergent and rinsed with de-ionized (DI) water between wells. The static water level and well depth are used to calculate the well casing volume. A minimum of 4 well casing volumes of water are purged from the well prior to sampling in order to obtain a representative sample of the groundwater from the formation surrounding the well. Wells should be purged and sampled in order of least to highest suspected concentrations.

Standard purging equipment is an electric submersible pump. Alternatively, purging and sampling systems may be disposable or dedicated (installed in the well) PVC, teflon, or stainless steel bailers; or bladder pumps. Appropriate personal protective equipment is worn during purging. The well is purged until the clarity, pH, and conductivity of the discharged water has stabilized. "Stabilized" is defined as three consecutive readings within 10% of one another.

These parameters are measured and recorded initially, after every well casing volume is removed, and after the sample is collected. In some localities, turbidity, Eh, and dissolved oxygen measurements may also be required. If the well is purged dry prior to the removal of three or four casing volumes of water, the water level is allowed to recover to 80% of the static level before sampling. Whenever possible, samples will be collected within 24 hours after purging. Ideally, samples will be collected immediately after purging to minimize volatilization of aromatic hydrocarbons.

The standard sampling equipment will be inert polyethylene disposable bailers. New sampling gloves are worn during each sample collection. Sample containers typically consist, depending on the analysis, 40 milliliter volatile organic analysis (VOA) vials with teflon septa, 1 liter amber glass bottles, or plastic bottles. HCl or other preservative are added to the sample containers as appropriate by the laboratory prior to sampling. The groundwater sample is decanted into each VOA vial to form a meniscus at the top to eliminate air bubbles when capped. The sample is labeled with date, time, sample number, project number and analysis. The samples are stored in a cooler with blue ice or ice, and delivered under chain-of-custody to the state-certified analytical laboratory. For quality control purposes, duplicate samples, trip blanks, and equipment blanks may also be collected. The duplicate sample is given a different number than the original sample from the same well. Trip blanks are prepared by the laboratory using DI water and remain in the cooler. Equipment blanks are collected from sampling equipment using DI water after the equipment has been decontaminated and rinsed.

All non-dedicated purging and sampling equipment is washed in non-phosphate detergent solution and double rinsed with DI water after use in every well to avoid cross-contamination.

Purge water will be properly disposed or temporarily contained in labeled steel barrels pending chemical analysis to determine proper disposal procedure.

APPENDIX C

"When Quality Counts"

Analytical Report

WorkOrder: 1709045

Amended: 10/24/2017

Report Created for: ERAS Environmental, Inc.

1533 B Street
Hayward, CA 94541

Project Contact: Greg Munsell

Project P.O.:

Project Name: 16-005-02; 1091 Calcot Place, Oakland

Project Received: 09/01/2017

Analytical Report reviewed & approved for release on 09/13/2017 by:

Yen Cao
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: ERAS Environmental, Inc.
Project: 16-005-02; 1091 Calcot Place, Oakland
WorkOrder: 1709045

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: ERAS Environmental, Inc.
Project: 16-005-02; 1091 Calcot Place, Oakland
WorkOrder: 1709045

Analytical Qualifiers

- B Analyte detected in the associated Method Blank and in the sample
J Result is less than the RL/ML but greater than the MDL. The reported concentration is an estimated value.
H Samples were analyzed out of holding time
S Surrogate spike recovery outside accepted recovery limits
a3 Sample diluted due to high organic content.
a4 Reporting limits raised due to the sample's matrix prohibiting a full volume extraction.
a9 Reporting limit near, but not identical to, our standard reporting limit due to variable Encore/Solid sample weight
a19 Reporting limit near, but not identical to our standard reporting limit due to variable sample volume
b1 Aqueous sample that contains greater than ~1 vol. % sediment
c1 Surrogate recovery outside of the control limits due to the dilution of the sample.
c2 Surrogate recovery outside of the control limits due to matrix interference.
e2/e3 Diesel range compounds are significant; no recognizable pattern; and/or Aged diesel is significant
e2 Diesel range compounds are significant; no recognizable pattern
e7 Oil range compounds are significant

Quality Control Qualifiers

- F2 LCS/LCSD recovery and/or RPD is out of acceptance criteria.

1709045-005C	B-8	Water	TPH(g) & 8260 by P&T GCMS	2	VOA w/ HCl	<input type="checkbox"/>	8/30/2017 10:53	5 days	50%+	<input type="checkbox"/>	
				1	ILA	<input type="checkbox"/>			50%+	<input type="checkbox"/>	
1709045-005D	B-8	Water	SW8015B (TPH-d,mo w/ S.G. Clean-Up)	2	VOA w/ HCl	<input type="checkbox"/>	8/30/2017 10:53	5 days	50%+	<input type="checkbox"/>	

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

1709045-042A	EW-1, 8 feet	Soil	TPH(g) & 8260 by P&T GCMS [Encore]	1	Encore Sampler	<input type="checkbox"/>	8/31/2017 14:02	5 days		<input type="checkbox"/>	

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

WORK ORDER SUMMARY

Client Name: ERAS ENVIRONMENTAL, INC.

Project: 16-005-02; 1091 Calcot Place, Oakland

Work Order: 1709045

Client Contact: Greg Munsell

QC Level: LEVEL 2

Contact's Email: info@eras.biz; greg@eras.biz

Chain of Custody (COC) Information

Chain of custody present?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody signed when relinquished and received?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody agrees with sample labels?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample IDs noted by Client on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Date and Time of collection noted by Client on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sampler's name noted on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
COC agrees with Quote?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>

Sample Receipt Information

Custody seals intact on shipping container/coolier?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Shipping container/coolier in good condition?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Samples in proper containers/bottles?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample containers intact?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sufficient sample volume for indicated test?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes <input type="checkbox"/>	No <input checked="" type="checkbox"/>	NA <input type="checkbox"/>
Sample/Temp Blank temperature	Temp: <input checked="" type="checkbox"/>		
Water - VOA vials have zero headspace / no bubbles?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Sample labels checked for correct preservation?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
pH acceptable upon receipt (Metal: <2; 522: <4; 218.7: >8)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Samples Received on Ice?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
(Ice Type: WET ICE)			

UCMR Samples:

Total Chlorine tested and acceptable upon receipt for EPA 522? Yes	<input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Free Chlorine tested and acceptable upon receipt for EPA 218.7, 300.1, 537, 539?	<input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>

Comments: Method SW8260B (VOCs) (Encore) was received past its 2-day holding time. Method SW8260B (TPH(g) (Encore)) was received past its 2-day holding time. Method SW8015B (Diesel & Motor Oil) was received past its 7-day holding time. Method SW8015B (TPH-d,mo w/ S.G. Clean-Up) was received past its 7-day holding time. Method SW8270C (SVOCS) was received past its 7-day holding time. Method SW8270C (PAHs/PNAs) was received past its 7-day holding time.

"When Quality Counts"

Analytical Report

WorkOrder: 1709972

Report Created for: ERAS Environmental, Inc.

1533 B Street
Hayward, CA 94541

Project Contact: Greg Munsell

Project P.O.:

Project Name: 16-005-02; 1091 Calcot Place, Oakland

Project Received: 09/22/2017

Analytical Report reviewed & approved for release on 10/02/2017 by:

Angela Rydelius,
Laboratory Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: ERAS Environmental, Inc.
Project: 16-005-02; 1091 Calcot Place, Oakland
WorkOrder: 1709972

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: ERAS Environmental, Inc.
Project: 16-005-02; 1091 Calcot Place, Oakland
WorkOrder: 1709972

Analytical Qualifiers

B Analyte detected in the associated Method Blank and in the sample
J Result is less than the RL/ML but greater than the MDL. The reported concentration is an estimated value.
S Surrogate spike recovery outside accepted recovery limits
c2 Surrogate recovery outside of the control limits due to matrix interference.
e2 Diesel range compounds are significant; no recognizable pattern
e7 Oil range compounds are significant
e11/e4 Pattern resembles stoddard solvent/mineral spirit; and/or Gasoline range compounds are significant.

Quality Control Qualifiers

F1 MS/MSD recovery and/or RPD is out of acceptance criteria; LCS validates the prep batch.
F2 LCS/LCSD recovery and/or RPD is out of acceptance criteria.

Comments:

NOTE: Soil samples are discarded 60 days after results are reported unless other arrangements are made (Water samples are 30 days). Hazardous samples will be returned to client or disposed of at client expense.

WORK ORDER SUMMARY

Client Name: ERAS ENVIRONMENTAL, INC.

Project: 16-005-02; 1091 Calcot Place, Oakland

Work Order: 1709972

Client Contact: Greg Munsell

QC Level: LEVEL 2

Contact's Email: info@eras.biz; greg@eras.biz

Clean-Up) SW8015B (Diesel & Motor Oil) SW8270C (SVOCS) SW8270C (PAHs/PNAs) TPH(g) & 8260 by P&T GCMS	2	Acetate Liner	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>	9/22/2017 8:22	5 days	<input checked="" type="checkbox"/>		
								5 days	<input type="checkbox"/>		
								5 days	<input type="checkbox"/>		
								5 days	<input type="checkbox"/>		
								5 days	<input type="checkbox"/>		

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

Sample Receipt Checklist

Client Name:	ERAS Environmental, Inc.	Date and Time Received:	9/22/2017 10:07
Project Name:	16-005-02	Date Logged:	9/22/2017
WorkOrder No:	1709972	Received by:	Maria Venegas
Carrier:	<u>Client Drop-In</u>	Logged by:	Alexandra Iniguez

Chain of Custody (COC) Information

Chain of custody present?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody signed when relinquished and received?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Chain of custody agrees with sample labels?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample IDs noted by Client on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Date and Time of collection noted by Client on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sampler's name noted on COC?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
COC agrees with Quote?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>

Sample Receipt Information

Custody seals intact on shipping container/coolier?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Shipping container/coolier in good condition?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Samples in proper containers/bottles?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sample containers intact?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
Sufficient sample volume for indicated test?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Sample/Temp Blank temperature		Temp: 12.2°C	NA <input type="checkbox"/>
Water - VOA vials have zero headspace / no bubbles?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	NA <input type="checkbox"/>
Sample labels checked for correct preservation?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	
pH acceptable upon receipt (Metal: <2; 522: <4; 218.7: >8)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Samples Received on Ice?	Yes <input checked="" type="checkbox"/>	No <input type="checkbox"/>	

(Ice Type: WET ICE)

UCMR Samples:

Total Chlorine tested and acceptable upon receipt for EPA 522? Yes	<input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
Free Chlorine tested and acceptable upon receipt for EPA 218.7, 300.1, 537, 539?	<input type="checkbox"/>	No <input type="checkbox"/>	NA <input checked="" type="checkbox"/>
