=

Dear Lisa:

**Self-Monitoring Program  
NPDES Permit No. 88-119  
Dewatering Effluent Treatment System  
Chinatown Redevelopment Project Area  
Oakland, California**

This letter concerns the Part B self-monitoring program established for the dewatering effluent treatment system located at Tenth and Webster streets in Oakland, California. The system is operated and monitored by Harding Lawson Associates (HLA) on behalf of the City of Oakland Redevelopment Agency (Agency) under authority of NPDES Permit No. 88-119.

The influent and effluent to the treatment system are currently sampled and analyzed on a weekly basis for constituents identified by EPA Test Methods 8015, 601, 602, and 504. Samples have been collected and analyzed on a weekly basis from May to the present time. Results of sample analysis, as presented in monthly reports submitted to the RWQCB and prepared by HLA, indicate that:

- The operation of the system has been consistent and predictable, as evidenced by analytical results of effluent samples
- The system has generally removed target organic compounds to non-detectable levels
- There were no confirmed exceedences of effluent limitations for organic compounds in July, August, or September. (Toluene was detected at 2.1 and 0.9 lg/l in effluent samples collected on July 22 and August 3, respectively, but was not identified in duplicate effluent samples collected on those dates.)

Based on the proven reliability and performance of the system, a modification of sampling frequency to once per month is requested. We would like to make this modification as soon as possible and respectfully request a response from you at your earliest convenience.

Please call if you have any questions.

Yours very truly,

HARDING LAWSON ASSOCIATES

## I INTRODUCTION

This report discusses the operation and monitoring of the dewatering effluent treatment system at 10th and Webster streets, Oakland, California, from September 1 to September 30, 1988. The system is treating water produced during ground-water dewatering of the block bounded by 10th, 11th, Webster, and Franklin streets, in conjunction with construction in progress at the site. The system is designed to remove petroleum hydrocarbons from dewatering effluent before the effluent is discharged to the storm drain.

This report has been prepared by Harding Lawson Associates (HLA) and is submitted in compliance with NPDES Permit CA 0029394, adopted on July 20, 1988, by the California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB). Under the NPDES permit, treatment system discharge limits are 50 parts per billion (ppb) for total petroleum hydrocarbons (TPH) identified as gasoline; 5.6 ppb for lead; 5.0 ppb each for chlorobenzene, 1,2-dichloroethane, 1,2-dichloropropane, trichloroethylene, 1,1,2-trichloroethane, benzene, xylenes, and ethylbenzene; 0.5 ppb for toluene; 0.01 ppb for ethylene dibromide; and 0.0 ppb for total residual chlorine.

## II TREATMENT SYSTEM OPERATION

The dewatering effluent treatment system was installed March 8, 1988, and has been in continuous operation since March 14. Water is treated by pumping it through four carbon contactors arranged in pairs. Organic compounds in the influent are adsorbed on the carbon. Each pair of contactors is arranged in parallel, and together constitute a module; the two modules are arranged in series. The system is configured so that water from the dewatering wells may be pumped through either module first. The system also comprises a holding tank for influent water, pumps, filters, piping, and instrumentation. Four water sampling ports -- one influent, two intermediate, and one effluent -- enable water samples to be collected throughout the treatment process. The intermediate ports are located between the two modules so the effectiveness of the first pair of contactors in reducing influent concentrations can be monitored. Depending on the configuration of modules, only one of these ports is intermediate in the system at any one time.

Treated effluent is discharged to the storm drain. From September 1 to October 1, total discharge of the system was 675,600 gallons, based on readings of the flow totalizing meter located in the discharge line. Average flow for this period was 15.6 gallons per minute (gpm), with weekly average flows ranging from 15.4 to 17.2 gpm.

The system was backwashed on September 1, September 15 and September 28.

Throughout the month, a floating residential swimming pool type chlorinator was deployed in the holding tank to retard algal growth in the treatment system.

On the morning of September 8, 1988, an estimated 250 gallons of water were released as a result of a pipe failure in a section of pipe which serves as a sampling port.

The treatment system was turned off and influent ground water was held until repairs were completed on the evening of September 8. Upon installation of a new section of pipe, the system was turned back on and all piping in the system was checked for leaks. The release was described in detail in a letter to the California RWQCB dated September 14.

Neither the release nor the mechanism of release in any way affected the operational integrity of the carbon adsorption vessels or the ability of the system to remove organic compounds from the dewatering influent prior to discharge to the storm drain.

### III TREATMENT SYSTEM MONITORING

#### A. Sample Collection and Analysis

Samples of treatment system water were collected weekly during this reporting period from the influent, intermediate, and effluent sampling ports. Quality Assurance/Quality Control samples consisted of weekly trip blanks.

All treatment system samples collected during this period were analyzed by Pace Laboratories, Novato, California, a California-certified laboratory. All influent, effluent and blank samples were analyzed for TPH as gasoline by EPA Test Method 8015, for purgeable volatile organic compounds by EPA Test Method 602, for halogenated hydrocarbons by EPA Test Method 601, for ethylene dibromide by EPA Test Method 504, and for total residual chlorine by Standard Method 408E. Intermediate samples collected September 1 and 9 were analyzed by Methods 8015, 601, 602 and 408E. Intermediate samples collected September 16, 23, and 29 were analyzed by Method 601 only. Effluent samples collected September 1 were analyzed for dissolved oxygen.

Results of analyses of samples collected August 5 through September 29 are summarized in Tables 1 through 4. Only analytical results for samples collected in September are discussed in this report. Laboratory reports for treatment system samples collected in September are presented in Appendix A.

#### B. Discharge Limit Exceedences

There were five possible exceedences of a permitted effluent discharge limit during this reporting period. The reported concentrations of residual chlorine in all effluent samples collected during September were greater than 0.0  $\mu\text{g/l}$  (micrograms per liter, equivalent to ppb). Concentrations of total residual chlorine ranged from 0.01 to 0.02 mg/l (milligrams per liter, equivalent to ppm).

**There were no exceedences of permitted effluent discharge limits for Test Method 601 or 602 compounds, for TPH as measured by Method 8015 or for EDB as measured by Method 504 during this reporting period.**

#### IV RESULTS

Results of influent, intermediate, and effluent sample analyses for TPH and for EPA Test Method 601, 602 and 504 compounds, indicate that on most days sampled the treatment system removed all individual constituents to below detection levels. On September 16, 23, and 29, 1,2-dichloroethane was detected at concentrations of 0.8, 1.4, and 0.6  $\mu\text{g/l}$ , respectively. Trichloroethene was detected at a concentration of 0.6  $\mu\text{g/l}$  on September 23. Tetrachloroethene was detected at a concentration of 0.5  $\mu\text{g/l}$  on September 29. Residual chlorine was detected in each effluent sample collected during September at concentrations ranging from 0.01 to 0.02 mg/l.

Dissolved oxygen in the effluent was measured on September 1 at a concentration of 6.3 mg/l.

Methylene chloride was detected in trip blanks on September 16 and September 29 at concentrations of 0.9  $\mu\text{g/l}$  and 0.6  $\mu\text{g/l}$ , respectively. 1,2-dichloroethane was detected in trip blanks on the same two days at concentrations of 0.5  $\mu\text{g/l}$  on both days.

## REPORT OF LABORATORY ANALYSIS

## Offices:

Minneapolis, Minnesota  
Tampa, Florida  
Coralville, Iowa  
Novato, California

Report date: September 23, 1988  
Client: Harding Lawson Associates  
200 Rush Landing Road  
Novato, CA 94947  
Attn.: D. Leland

Pace job #: HLA 0831.91-L

Date sampled: September 1, 1988                      Site: City of Oakland  
Sampled by: C. Larkin

Date received: September 1, 1988                      P.O.: 9382, 026.02  
Submitted by: C. Larkin

Dear Client,

No problems were encountered with the analysis of your samples. We will store samples for 30 days after the report date. The samples will be returned to the client after the 30-day period, unless other arrangements are made.  
If you have any questions, please feel free to call Lisa Petersen, our Client Services Coordinator at (415)883-6100.

*C. Sontag*

Dear Client,

No problems were encountered with the analysis of your samples. We will store samples for 30 days after the report date. The samples will be returned to the client after the 30-day period, unless other arrangements are made. If you have any questions, please feel free to call Lisa Petersen, our Client Services Coordinator at (415)883-6100.

Dear Client,

No problems were encountered with the analysis of your samples. We will store samples for 30 days after the report date. The samples will be returned to the client after the 30-day period, unless other arrangements are made. If you have any questions, please feel free to call Lisa Petersen, our Client Services Coordinator at (415)883-6100.

Dear Client,

No problems were encountered with the analysis of your samples. We will store samples for 30 days after the report date. The samples will be returned to the client after the 30-day period, unless other arrangements are made. If you have any questions, please feel free to call Lisa Petersen, our Client Services Coordinator at (415) 883-6100.

A handwritten signature in black ink, appearing to read "C. Sontag".

Dear Client,

No problems were encountered with the analysis of your samples. We will store samples for 30 days after the report date. The samples will be returned to the client after the 30-day period, unless other arrangements are made. If you have any questions, please feel free to call Lisa Petersen, our Client Services Coordinator at (415) 883-6100.

Please note: included with the requested results are 8020 results for lab numbers 9429 and 9434. You will not be charged for these, as they were not requested.
