Dear Ms. Jakub:

Re: Groundwater Monitoring Report - Fourth Quarter 2008
1137-1167 65th Street
Oakland, California 94608
Agency Case No. RO0082

On behalf of Mr. John Nady (Nady), Conestoga-Rovers & Associates (CRA) is submitting this *Groundwater Monitoring Report -Fourth Quarter 2008*. Presented in this report is a summary of the field activities and results from the fourth quarter 2008 groundwater monitoring event. In addition, this report contains recommendations for first quarter 2009 activities.

If you have any questions, please call me at (510) 420-3307.

Yours truly,
CONESTOGA-ROVERS & ASSOCIATES

1.0 INTRODUCTION

On behalf of the Mr. John Nady, Trustee of the Nady Trust (Nady), Conestoga-Rovers & Associates (CRA) is submitting this *Groundwater Monitoring Report -Fourth Quarter 2008*. This report describes the fourth quarter 2008 groundwater monitoring activities performed at 1137-1167 65th Street, Oakland, California (Figure 1).

This groundwater monitoring event was conducted at the direction of the Alameda County Health Care Services Agency, Environmental Health Division (ACEH). This report presents a summary of the monitoring activities and results from the fourth quarter 2008 monitoring event. In addition, this report contains recommendations for first quarter 2009 activities.

Site Address	1137-1167 65 th Street, Oakland, CA
Site Use	Commercial
Client and Contact	John Nady, Trustee of the Nady Trust Contact: Frederic Schrag
Consultant and Contact Person	CRA, Mark Jonas, P.G.
Lead Agency and Contact Person	Alameda County Environmental Health Ms. Barbara Jakub
Fuel Leak Case No.	RO0000082

2.0 SITE ACTIVITIES AND RESULTS

2.1 CURRENT QUARTER'S ACTIVITIES

CRA coordinated with Muskan Environmental Sampling (MES) to perform quarterly groundwater monitoring activities at the site. On December 18, 2008, MES measured groundwater levels in all thirteen monitoring wells and collected groundwater samples from nine of the thirteen wells. As recommended in the *Groundwater Monitoring Report – Fourth Quarter 2005* and approved by Mr. Barney Chan of ACEH, the sampling and analysis was as follows:

- Total petroleum hydrocarbons as diesel (TPHd), gasoline (TPHg), motor oil (TPHmo), and stoddard solvent (TPHss); and benzene, toluene, ethylbenzene, and total xylenes (BTEX) are analyzed in groundwater samples collected from monitoring wells MW-1A, MW-2A, MW-3A, MW-4A, MW-6A, MW-7A, and MW-6B.
- Halogenated volatile organic compounds (HVOCs) are analyzed in groundwater samples collected from monitoring wells MW-1A, MW-3A, MW-6A, MW-7A, MW-1B, MW-6B, and MW-6C.
- It is not necessary to analyze groundwater samples for methyl tertiary butyl ether (MTBE).
- Monitoring wells MW-4B, MW-5B, MW-1C, and MW-4C are no longer sampled.

2.1.1 WATER LEVEL MEASUREMENTS

Depth to groundwater measurements were recorded to the nearest 0.01-foot, relative to a previously established reference elevation. Measurements were collected using an electric, conductance-actuated well sounder. Copies of the field data sheets are included as Appendix C. The groundwater level measurement data are summarized in Table 2.

2.1.2 GROUNDWATER SAMPLING

MES collected groundwater samples from wells MW-1A, MW-2A, MW-3A, MW-4A, MW-6A, MW-7A, MW-1B, MW-6B, and MW-6C. Prior to sampling, the wells were purged to remove standing water in the well casing and annulus to promote inflow of representative groundwater from the surrounding formation. Each well was purged using a new disposable bailer, pre-cleaned poly vinyl chloride (PVC) bailer, or

disposable tubing with a check valve. Field measurements of pH, specific conductance, and temperature of purged groundwater were measured after extraction of each successive casing volume. Casing volumes were calculated based on well diameter and height of the water column. Typically, purging continued until at least three casing volumes are extracted and consecutive pH, specific conductance, and temperature measurements appeared to stabilize. Water quality field measurements, purge volumes and sample collection data were recorded on field sampling data forms (Appendix C).

To minimize the potential for cross-contamination, groundwater monitoring equipment was decontaminated prior to being used in the first monitoring well and between successive wells. Groundwater samples were collected from each of the wells using clean disposable bailers or disposable tubing with a check valve. The samples were decanted from the bailers into 1-liter (L) amber glass containers and/or 40-milliliter (mL) glass volatile organic analysis (VOA) vials, both supplied by McCampbell Analytical, Inc. (McCampbell) of Pittsburg, California. Sample containers were labeled and placed in a cooler chilled with water-based ice, for temporary storage and transport. A chain-of-custody record was maintained (Appendix B).

Groundwater samples were analyzed for TPHd, TPHg, TPHmo, and TPHss by modified United States Environmental Protection Agency (EPA) Method SW8015C. BTEX were analyzed by EPA Method SW8021B. Samples were also analyzed for HVOCs by EPA Method SW8260B, but only reported for the EPA Method 8010 basic target list. Samples marked for TPHd and TPHmo analysis were subjected to silica gel cleanup prior to analysis. The laboratory analytical report is included in Appendix B. Analytical results are summarized on Figures 2, 3, and 4 and presented in Tables 2 and 3.

2.1.2 WASTE DISPOSAL

Approximately 60 gallons of purge water were generated during this quarter's monitoring event. This waste water is stored in sealed Department of Transportation (DOT) approved 55-gallon drums and temporarily left on site for eventual transport and disposal.

2.2 CURRENT QUARTER'S RESULTS

A-Zone

Groundwater Flow Direction

Southwest

Hydraulic Gradient	0.03
Range of Measured Water Depth from Top of Casing in Monitoring Wells	2.16 to 4.63 feet
Were Measureable Separate Phase	No
Hydrocarbons Observed	

B-Zone

Groundwater Flow Direction	Southwest
Hydraulic Gradient	0.03
Range of Measured Water Depth from Top of Casing in Monitoring Wells	5.15 to 9.16 feet
Were Measureable Separate Phase	No
Hydrocarbons Observed	

C-Zone

Groundwater Flow Direction	West-southwest
Hydraulic Gradient	0.006
Range of Measured Water Depth from Top of Casing in Monitoring Wells	7.95 to 9.21 feet
Were Measureable Separate Phase	No
Hydrocarbons Observed	

2.2.1 GROUNDWATER FLOW DIRECTION AND GRADIENT

Depth-to-water measurements collected from 13 wells on December 18, 2008 ranged from 2.16 to 9.21 feet (ft) below top of casing (TOC). Groundwater elevations were calculated by subtracting the depth-to-water measurements from the surveyed TOC elevations. The groundwater elevations for A, B, and C water-bearing zones were each plotted and contoured on Figures 2, 3, and 4, respectively.

The A-zone is defined as the first encountered groundwater bearing zone from approximately 3.5 feet below ground surface (ft bgs) to 12 ft bgs. A-zone monitoring wells are MW-1A, MW-2A, MW-3A, MW-4A, MW-6A, and MW-7A. The groundwater flow direction in the A-zone was southwest with a gradient of approximately 0.03 ft/ft (Figure 2). The B-zone is defined as the second encountered groundwater bearing zone from approximately 13 ft bgs to 24 ft bgs. B-zone monitoring wells are MW-1B, MW-4B, MW-5B, and MW-6B. The groundwater flow direction in the B-zone was southwest with a gradient of approximately 0.03 ft/ft (Figure 3). The C-zone is defined as the third encountered groundwater bearing zone from approximately 25 ft bgs to 46 ft bgs. C-zone monitoring wells are MW-1C, MW-4C, and MW-6C. The groundwater flow direction in the C-zone was west-southwest with a gradient of approximately 0.006 ft/ft (Figure 4).

Rose diagrams depicting historical groundwater flow directions for the A, B, and C-zones are presented on the figures. The groundwater flow direction and gradient in the A-zone, B-zone, and C-zone are generally consistent with historical results. Depth-to-water and groundwater elevation data are presented in Tables 2 and 3.

2.2.2 CHEMICALS DETECTED IN A-ZONE GROUNDWATER

During this monitoring event, groundwater samples from A-zone monitoring wells MW-1A, MW-2A, MW-3A, MW-4A, MW-6A, and MW-7A were analyzed for petroleum hydrocarbons. Groundwater from A-zone monitoring wells MW-1A, MW-3A, MW-6A, and MW-7A were analyzed for HVOCS.

Petroleum hydrocarbons were detected in all six A-zone monitoring wells sampled. TPHd concentrations ranged from 73 micrograms per liter ($\mu\text{g}/\text{L}$) to 28,000 $\mu\text{g}/\text{L}$. The highest TPHd concentration was detected in MW-7A. TPHg concentrations ranged from 140 $\mu\text{g}/\text{L}$ to 6,200 $\mu\text{g}/\text{L}$ with the highest concentration detected in MW-7A. TPHmo was only detected above the laboratory reporting limit in wells MW-2A and MW-6A at 320 $\mu\text{g}/\text{L}$ and 460 $\mu\text{g}/\text{L}$, respectively. TPHss concentrations ranged from 93 $\mu\text{g}/\text{L}$ to 9,100 $\mu\text{g}/\text{L}$. The highest TPHss was detected in well MW-7A.

Benzene was detected in well MW-4A at a concentration of 0.67 $\mu\text{g}/\text{L}$. Toluene was detected in wells MW-2A and MW-4A at concentrations of 2.7 $\mu\text{g}/\text{L}$ and 1.4 $\mu\text{g}/\text{L}$, respectively. Ethylbenzene was detected in wells MW-1A, MW-6A, and MW-7A at concentrations of 3.3 $\mu\text{g}/\text{L}$, 1.2 $\mu\text{g}/\text{L}$, and 2.7 $\mu\text{g}/\text{L}$, respectively. Xylenes were detected in well MW-4A at a concentration of 2.3 $\mu\text{g}/\text{L}$.

HVOCS were detected in two of the A-zone monitoring wells sampled. The HVOCS detections were as follows:

- Tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), 1,1-dichloroethane (1,1-DCA), and vinyl chloride concentrations were detected in well MW-1A at concentrations of 8.6 µg/L, 8.6 µg/L, 13 µg/L, 0.99 µg/L, 1.5 µg/L, and 2.7 µg/L, respectively.
- Chlorobenzene was detected in well MW-3A at a concentration of 95 µg/L.
- No HVOCS were detected in well MW-6A.
- No HVOCS were detected in well MW-7A.
- A-zone groundwater analytical data and water level data are presented in Tables 2 and 3, and summarized on Figure 2.

2.2.3 CHEMICALS DETECTED IN B-ZONE GROUNDWATER

During the fourth quarter 2008, groundwater samples from B-zone monitoring well MW-6B were analyzed for petroleum hydrocarbons by EPA Methods SW8015C and SW8021B, and wells MW-1B and MW-6B were analyzed for HVOCS.

- TPHd, TPHg, and TPHss were detected in well MW-6B at concentrations of 29,000 µg/L, 5,200 µg/L, and 7,400 µg/L, respectively.
- No benzene, toluene, ethylbenzene, or xylenes were detected at or above the laboratory detection limits for well MW-6B.
- The following HVOCS were detected in well MW-1B: chloroethane (1.2 µg/L) cis-1,2-DCE (16 µg/L), 1,1-DCA (8.2 µg/L), and 1,2-DCA (9.3 µg/L).
- No HVOCS were detected in well MW-6B, though the method detection limits were raised. B-zone groundwater analytical data and water level data are presented in Tables 2 and 3, and summarized on Figure 3.

2.2.4 CHEMICALS DETECTED IN C-ZONE GROUNDWATER

No C-zone wells were sampled for petroleum hydrocarbons. Only C-zone well MW-6C was sampled and analyzed for HVOCS.

- The following HVOCS were detected in well MW-6C: PCE (3.7 µg/L), TCE (4.1 µg/L), cis-1,2-DCE (18 µg/L), 1,1-DCA (0.58 µg/L), and vinyl chloride (2.8 µg/L).
- No other HVOCS were detected in well MW-6C. C-zone groundwater analytical data and water level data are presented in Tables 2 and 3, and summarized on Figure 4.

2.2.5 GEOTRACKER SUBMITTALS

CRA uploaded fourth quarter 2008 groundwater depth data, analytical results, and this report to the State's GeoTracker database on behalf of Nady.

2.3 PROPOSED ACTIVITIES FOR NEXT QUARTER

2.3.1 GROUNDWATER MONITORING

A quarterly groundwater monitoring event will occur during the first quarter 2009. As approved by the ACEH in a letter dated September 3, 2008, CRA will modify its groundwater monitoring and sampling program to include additional laboratory analyses and the installation of a data logger in wells MW-1A, MW-1B, and MW-1C, all of which are described more fully in CRA's *Groundwater Monitoring Work Plan*, dated July 1, 2008. Implementation of this approach is dependent on cost pre-approval by the State Water Resources Control Board, UST Cleanup Fund (USTCF). The cost pre-approval was sent to the USTCF on December 11, 2008 and they are currently reviewing the request.

A report will be prepared detailing the activities and findings of the first quarter 2009 event to be submitted to ACEH. Groundwater analytical, well gauging data and groundwater monitoring report will be uploaded to GeoTracker. The first quarter 2009 groundwater monitoring report will be submitted via ACEH's file transfer protocol (ftp) site and notification will be sent to Ms. Jakub by e-mail.

2.3.2 SITE CHARACTERIZATION

As approved by the ACEH in a letter dated September 3, 2008, CRA will implement the proposed soil, groundwater, and soil vapor investigation outlined in CRA's *Additional Site Characterization Work Plan*, dated July 1, 2008, with the provisions contained in the

ACEH approval letter. Implementation of this work is dependent on cost pre-approval by the USTCF. The cost pre-approval was sent to the USTCF on December 11, 2008 and they are currently reviewing the request.

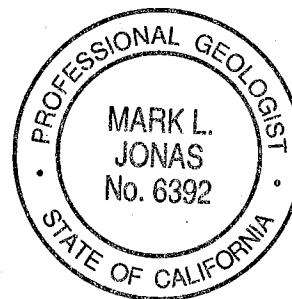

All of Which is Respectfully Submitted,

Abbreviations:

$\mu\text{g}/\text{L}$ = micrograms per liter - approximately equal to parts per billion = ppb

(TOC) = Top of casing elevation in feet above mean sea level (msl)

ft = measured in feet

TPHd = Total petroleum hydrocarbons as diesel by EPA Method SW8015C with silica gel cleanup.

TPHg = Total petroleum hydrocarbons as gasoline by EPA Method SW8015C.

Notes:

a = TPH pattern that does not appear to be derived from gasoline (stoddard solvent/mineral spirit?).

b = No recognizable pattern.

c = Stoddard solvent/mineral spirit.

d = Diesel range compounds are significant; no recognizable pattern.

MONITORING WELL GROUNDWATER ANALYTICAL RESULTS: PETROLEUM HYDROCARBONS
JOHN NADY
1137-1167 65TH STREET, OAKLAND, CA

Well ID (TOC)	Date Sampled	Groundwater Zone	Groundwater Elevation (ft msl)	Depth to Water (ft, TOC)	TPHd ($\mu\text{g}/\text{L}$)	TPHg ($\mu\text{g}/\text{L}$)	TPHmo ($\mu\text{g}/\text{L}$)	TPHss ($\mu\text{g}/\text{L}$)	Benzene ($\mu\text{g}/\text{L}$)	Toluene ($\mu\text{g}/\text{L}$)	Ethylbenzene ($\mu\text{g}/\text{L}$)	Xylenes ($\mu\text{g}/\text{L}$)	MTBE ($\mu\text{g}/\text{L}$)	Notes
------------------	-----------------	---------------------	--------------------------------------	--------------------------------	------------------------------------	------------------------------------	-------------------------------------	-------------------------------------	---------------------------------------	---------------------------------------	--	---------------------------------------	------------------------------------	-------

TPHmo = Total petroleum hydrocarbons as motor oil by EPA Method SW8015C with silica gel cleanup.

TPHss = Total petroleum hydrocarbons as stoddard solvent by EPA Method SW8015C.

Benzene, toluene, ethylbenzene, and xylenes by EPA Method SW8021B.

MTBE = Methyl tertiary-butyl ether by EPA Method SW8021B (EPA Method SW8260B).

-- = Not available, not applicable, not analyzed, not measured

e = Gasoline range compounds are significant.

f = One to a few isolated peaks present

g = Oil range compounds are significant.

h = Lighter than water immiscible sheen/product is present.

i = Liquid sample contains greater than ~1 vol. % sediment.

j = Unmodified or weakly modified gasoline is significant

k = TPHg range non-target isolated peaks subtracted out of the TPHg concentration

l = Heavier gasoline compounds are significant (aged gasoline?)

m = Strongly aged gasoline or diesel range compounds are significant

n = Diesel range compounds are significant

Abbreviations:

μg/L = micrograms per liter; equivalent to parts per billion

ft = measured in feet

ft amsl = measured in feet above mean sea level

TOC = Top of casing elevation in feet above mean sea level (msl)

Halogenated Volatile Organic Compounds analyzed by EPA Method SW8260B, reported EPA Method 8010 basic target list.

ND<0.5 = Not Detected above detection limit cited.

-- = Not available, not applicable, not analyzed, not measured

Notes:

b = sample diluted due to high organic content

i = liquid sample that contains greater than ~1 vol. % sediment

h = lighter than water immiscible sheen/product is present

j = sample diluted due to high organic content/matrix interference

APPENDIX A

STANDARD FIELD PROCEDURES FOR GROUNDWATER MONITORING AND SAMPLING

Conestoga-Rovers & Associates

STANDARD FIELD PROCEDURES FOR GROUNDWATER MONITORING AND SAMPLING

This document presents standard field methods for groundwater monitoring, purging and sampling, and well development. These procedures are designed to comply with Federal, State and local regulatory guidelines. Cambria's specific field procedures are summarized below.

Groundwater Elevation Monitoring

Prior to performing monitoring activities, the historical monitoring and analytical data of each monitoring well shall be reviewed to determine if any of the wells are likely to contain non-aqueous phase liquid (NAPL) and to determine the order in which the wells will be monitored (i.e. cleanest to dirtiest). Groundwater monitoring should not be performed when the potential exists for surface water to enter the well (i.e. flooding during a rainstorm).

Prior to monitoring, each well shall be opened and the well cap removed to allow water levels to stabilize and equilibrate. The condition of the well box and well cap shall be observed and recommended repairs noted. Any surface water that may have entered and flooded the well box should be evacuated prior to removing the well cap. In wells with no history of NAPL, the static water level and total well depth shall be measured to the nearest 0.01 foot with an electronic water level meter. Wells with the highest contaminant concentrations shall be measured last. In wells with a history of NAPL, the NAPL level/thickness and static water level shall be measured to the nearest 0.01 foot using an electronic interface probe. The water level meter and/or interface probe shall be thoroughly cleaned and decontaminated at the beginning of the monitoring event and between each well. Monitoring equipment shall be washed using soapy water consisting of Liqui-noxTM or AlconoxTM followed by one rinse of clean tap water and then two rinses of distilled water.

Groundwater Purging and Sampling

Prior to groundwater purging and sampling, the historical analytical data of each monitoring well shall be reviewed to determine the order in which the wells should be purged and sampled (i.e. cleanest to dirtiest). No purging or groundwater sampling shall be performed on wells with a measurable thickness of NAPL or floating NAPL globules. If a sheen is observed, the well should be purged and a groundwater sample collected only if no NAPL is present. Wells shall be purged either by hand using a disposal or PVC bailer or by using an aboveground pump (e.g. peristaltic or WatteraTM) or down-hole pump (e.g. GrundfosTM or DC Purger pump).

Groundwater wells shall be purged approximately three to ten well-casing volumes (depending on the regulatory agency requirements) or until groundwater parameters of temperature, pH, and conductivity have stabilized to within 10% for three consecutive readings. Temperature, pH, and conductivity shall be measured and recorded at least once per well casing volume removed. The total volume of groundwater removed shall be recorded along with any other notable physical characteristic such as color and odor. If required, field parameters such as turbidity, dissolved oxygen (DO), and oxidation-reduction potential (ORP) shall also be measured prior to collection of each groundwater sample.

Groundwater samples shall be collected after the well has been purged. If the well is slow to recharge, a sample shall be collected after the water column is allowed to recharge to 80% of the pre-purging static water level. If the well does not recover to 80% in 2 hours, a sample shall be collected once there is enough groundwater in the well. Groundwater samples shall be collected using clean disposable bailers or pumps (if an operating remediation system exists on site and the project manager approves of its use for sampling) and shall be decanted into clean containers supplied by the analytical laboratory. New latex gloves and disposable tubing or bailers shall be

Conestoga-Rovers & Associates

used for sampling each well. If a PVC bailer or down-hole pump is used for groundwater purging, it shall be decontaminated before purging each well by using soapy water consisting of Liqui-nox™ or Alconox™ followed by one rinse of clean tap water and then two rinses of distilled water. If a submersible pump with non-dedicated discharge tubing is used for groundwater purging, both the inside and outside of pump and discharge tubing shall be decontaminated as described above.

Sample Handling

Except for samples that will be tested in the field, or that require special handling or preservation, samples shall be stored in coolers chilled to 4° C for shipment to the analytical laboratory. Samples shall be labeled, placed in protective foam sleeves or bubble wrap as needed, stored on crushed ice at or below 4° C, and submitted under chain-of-custody (COC) to the laboratory. The laboratory shall be notified of the sample shipment schedule and arrival time. Samples shall be shipped to the laboratory within a time frame to allow for extraction and analysis to be performed within the standard sample holding times.

Sample labels shall be filled out using indelible ink and must contain the site name; field identification number; the date, time, and location of sample collection; notation of the type of sample; identification of preservatives used; remarks; and the signature of the sampler. Field identification must be sufficient to allow easy cross-reference with the field datasheet.

All samples submitted to the laboratory shall be accompanied by a COC record to ensure adequate documentation. A copy of the COC shall be retained in the project file. Information on the COC shall consist of the project name and number; project location; sample numbers; sampler/recorder's signature; date and time of collection of each sample; sample type; analyses requested; name of person receiving the sample; and date of receipt of sample.

Laboratory-supplied trip blanks shall accompany the samples and be analyzed to check for cross-contamination, if requested by the project manager.

Waste Handling and Disposal

Groundwater extracted during sampling shall be stored onsite in sealed U.S. DOT H17 55-gallon drums and shall be labeled with the contents, date of generation, generator identification, and consultant contact. Extracted groundwater may be disposed offsite by a licensed waste handler or may be treated and discharged via an operating onsite groundwater extraction/treatment system.

APPENDIX B

CERTIFIED ANALYTICAL REPORTS AND CHAIN-OF-CUSTODY DOCUMENTATION

WorkOrder: 0812585

December 29, 2008

Dear Mark:

Enclosed within are:

- 1) The results of the **9** analyzed samples from your project: **#521000; John Nady**,
- 2) A QC report for the above samples,
- 3) A copy of the chain of custody, and
- 4) An invoice for analytical services.

All analyses were completed satisfactorily and all QC samples were found to be within our control limits.

If you have any questions or concerns, please feel free to give me a call. Thank you for choosing
McCampbell Analytical Laboratories for your analytical needs.

Best regards,

Angela Rydelius
Laboratory Manager

Surrogate Recoveries (%)

%SS:	99	95	86		
Comments	d5,b6	d5,b6	d5,b6		

* water and vapor samples and all TCLP & SPLP extracts are reported in ug/L, soil/sludge/solid samples in mg/kg, wipe samples in μg/wipe, product/oil/non-aqueous liquid samples in mg/L.

cluttered chromatogram; sample peak coelutes with surrogate peak.

+The following descriptions of the TPH chromatogram are cursory in nature and McCampbell Analytical is not responsible for their interpretation:

- b1) aqueous sample that contains greater than ~1 vol. % sediment
- b6) lighter than water immiscible sheen/product is present
- d5) TPH pattern that does not appear to be derived from gasoline (stoddard solvent / mineral spirit?)
- d7) strongly aged gasoline or diesel range compounds are significant in the TPH(g) chromatogram
- d9) no recognizable pattern

MS = Matrix Spike; MSD = Matrix Spike Duplicate; LCS = Laboratory Control Sample; LCSD = Laboratory Control Sample Duplicate; RPD = Relative Percent Deviation.

% Recovery = 100 * (MS-Sample) / (Amount Spiked); RPD = 100 * (MS - MSD) / ((MS + MSD) / 2).

MS / MSD spike recoveries and / or %RPD may fall outside of laboratory acceptance criteria due to one or more of the following reasons: a) the sample is inhomogenous AND contains significant concentrations of analyte relative to the amount spiked, or b) the spiked sample's matrix interferes with the spike recovery.

N/A = not enough sample to perform matrix spike and matrix spike duplicate.

NR = analyte concentration in sample exceeds spike amount for soil matrix or exceeds 2x spike amount for water matrix or sample diluted due to high matrix or analyte content.

Laboratory extraction solvents such as methylene chloride and freon 113 may occasionally appear in the method blank at low levels.
