**RE: CONCEPTUAL SITE MODEL  
ARCO Station No. 2035  
1001 San Pablo Avenue  
Albany, California 94706  
Alameda County Environmental Health Case No. RO0000100**

Dear Ms. Couch:

Closure Solutions, Incorporated (Closure Solutions) is submitting this *Conceptual Site Model* (CSM) for ARCO Station No. 2035, located at 1001 San Pablo Avenue in Albany, California (the Site, Figure 1 in Attachment A) for the purpose of documenting soil and groundwater conditions at the Site based on available environmental data prepared by Atlantic Richfield Company's (ARC's) current and former consultants.

## 1.0 SITE SUMMARY

### 1.1 Location and Setting

The Site is located on the southeastern corner of San Pablo Avenue and Marin Avenue in Albany, California (Figure 1 in Attachment A). The land use in the immediate vicinity of the Site is mixed commercial and residential. A Shell branded gasoline service station is located north of the Site across Marin Avenue. The topography of the Site is relatively flat with an approximate elevation of 42 feet above mean sea level (USGS, Richmond Quadrangle, California). The Assessor's Parcel Number is 65-2662-1.

### 1.2 Current Use

The Site is an active retail gasoline station and AM/PM mini-mart and currently maintains four double-walled fiberglass gasoline underground storage tanks (USTs) and associated double-walled product lines and dispensers (Figure 2 in Attachment A).

### 1.3 Regional Hydrogeology

The Site is located within the northwestern portion of the Berkeley Sub-Area of the San Francisco East Bay Plain Groundwater Basin<sup>1</sup>. The Berkeley Sub-Area contains a series of alluvial fans deposited on a west sloping bedrock surface. The alluvial deposits range in thickness from 10 to 300 feet and average 200 feet. The Regional Water Board reports that there is no evidence that groundwater resources in the area are sufficient for municipal use. In the Berkeley Sub-Area, particularly in West Berkeley, first encountered groundwater is frequently reported as being semi-confined.<sup>1</sup>

Throughout most of the Alameda County portion of the East Bay Plain, from Hayward north to Albany, water level contours show that the general groundwater flow direction is from east to west. East Bay Plain cities do not have "...any plans to develop local groundwater resources for drinking water purposes because of existing or potential saltwater intrusion, contamination, or poor or limited quantity<sup>1</sup>." The San Francisco Regional Water Quality Control Board (SFRWQCB) Basin Plan lists existing beneficial uses of site groundwater as municipal and domestic supply, industrial process supply, industrial service supply, and agricultural supply.

### 1.4 Site Geology

Based on previous investigations and the USGS<sup>2</sup>, the Site is underlain by Holocene and Pleistocene age<sup>3</sup> alluvium. The Holocene alluvium (recent alluvium) consists of beds and lenses of fine-grained sandy silt and clay, clayey and silty sand, and fine gravel from near surface to approximately 10 to 12 feet below ground surface (bgs). The Pleistocene alluvium (old alluvium) consists of beds and lenses of clayey to silty sand, sandy gravel, and clayey to gravelly sand from approximately 12 feet bgs to the total depth investigated (34.5 feet bgs). Geologic cross-sections are presented as Figures 1 through 4 and soil borings logs details are presented in Attachment B. Monitor/remediation well construction details are included on Table 1.

### 1.5 Local Hydrology

Boring logs and water level elevation data indicate that groundwater under confining conditions is typically encountered in the old alluvium hydrologic unit at about 18 to 20 feet bgs and that a separate, shallower water bearing zone is present at about 10 feet bgs. Water level elevation data and well construction details from well pairs MW-1/ MW-7 and MW-3/ MW-9 indicate a downward vertical hydraulic gradient exists between the two water bearing zones. Groundwater

<sup>1</sup> *East Bay Plain Groundwater Basin Beneficial Use Evaluation Report* (California Regional Water Quality Control Board – San Francisco Bay Region [SFRWQCB], June 1999)

<sup>2</sup> Dibblee, T.W., 1980, Preliminary geologic map of the Richmond quadrangle, Alameda and Contra Costa Counties, California: USGS Open-File Report OF-80-1100

<sup>3</sup> The Holocene is the geologic time from of the end of Pleistocene glaciation and the ensuing raise in sea level that began 10,000 years before present. The Pleistocene spans about 2.5 million years of continental glacial advances and retreats.

elevation data for the two well pairs show seasonal head differentials ranging from about 0.5 to 2 feet, equivalent to gradients in the range of 0.04 to 0.17. A hydrograph supporting this observation is presented as Figures 5.

The confined groundwater exhibits a potentiometric surface of about 10 feet bgs and is inferred to flow in a general westerly direction under a hydraulic gradient of about 0.03 feet per foot (ft/ft). The confined groundwater bearing zone is recharged via subsurface inflow and flow through wells with screens that penetrate the intervening aquitard from the shallow water-bearing zone, and discharges via subsurface outflow.

Shallow groundwater in the recent alluvium is inferred to flow in a general westerly direction under a presumed hydraulic gradient of about 0.03 ft/ft. The shallow groundwater is recharged via subsurface inflow and infiltration of surface water, and is discharged via subsurface outflow, evapotranspiration, and presumed flow to the deeper water-bearing zones via monitor wells.

Shallow groundwater underlying the Site in both the recent alluvium and old alluvium hydrologic units is not used as a source of drinking water or for other beneficial uses. Local public utility companies supply local businesses and residences.

## **1.6 Sensitive Receptors**

Closure Solutions performed a Sensitive Receptor Survey in October 2011 to identify the presence of water wells within a ½-mile radius of the Site. Based on a review of well completion reports furnished by the Department of Water Resources (DWR), no wells were identified within a ½-mile radius of the Site. The nearest surface water body is the San Francisco Bay, located approximately 3,500 feet west-northwest of the Site.

## **2.0 SUMMARY OF PREVIOUS INVESTIGATIONS**

Based on various environmental documents prepared by ARC's current and former consultants, Closure Solutions has prepared the following summary of previous environmental corrective actions at the Site. While Closure Solutions does not have reason to believe that the information is incorrect, Closure Solutions has not independently verified this information for accuracy. It is our understanding that:

- August 1989: Applied GeoSystems performed a limited environmental assessment at the Site. A total of five soil borings (B-1 through B-5) were advanced to a maximum depth of 20.5 feet bgs near the vicinity of the existing gasoline USTs to evaluate potential hydrocarbon impacts to soil prior to removing and replacing the USTs. Total petroleum hydrocarbons as gasoline (TPHg) was identified at a depth of 10 feet bgs in borings B-1

and B-4 at a maximum concentration of 2,400 milligrams per kilogram (mg/kg [boring B-4]).

- June 1991: RESNA Environmental (RESNA) observed the advancement of soil borings B-6 and B-7 in the area of a proposed new UTS complex to evaluate for potential hydrocarbon impacts in soil. Analytical results from soil samples did not identify petroleum hydrocarbon constituents above laboratory reporting limits.
- July 1991: RESNA observed the excavation and removal of four existing USTs at the Site. Following removal, several of the tanks were reported to have visible holes. Based on the observations, approximately 350 cubic yards of hydrocarbon impacted soil to an average depth of 12 feet bgs were over-excavated from the UST pit and removed from the Site.
- October 1991: RESNA observed the installation of groundwater monitoring wells RW-1, MW-1, MW-2, and MW-3 to further evaluate the extent of petroleum hydrocarbons in soil and groundwater.
- November 1991: RESNA conducted a step-drawdown test in well RW-1 to determine the wells optimal pumping rate. Based on the step-drawdown results, an 18-hour pump and 6-hour recovery test were conducted on November 14 and 15, 1991. Wells MW-1, MW-2, and MW-3 were used as observation wells.
- August 1992: RESNA observed the advancement of eight soil borings (B-12 through B-19), six of which (B-14 through B-19) were converted into four-inch-diameter soil vapor extraction (SVE) wells (VW-1 through VW-6). Borings B-12 and B-13 were advanced in the vicinity of the former waste oil tank to evaluate impacts to soil from waste oil. Analytical results for collected samples from B-12 and B-13 reported low concentrations of ethylbenzene and xylenes at 9 feet bgs (B-12), TPH as diesel (TPHd) at maximum concentrations of 250 mg/kg at 9 feet bgs (B-12) and total oil and grease (TOG) at maximum concentrations of 1,800 mg/kg at 7.5 feet bgs (B-13). All other analyzed hydrocarbon constituents were below laboratory reporting limits.
- August 1992: RESNA performed a one-day SVE test to evaluate the feasibility of SVE as a remedial option. According to RESNA, based on results from the test, SVE was considered a viable remedial technology.
- November 1992: RESNA observed the installation of onsite wells MW-4 and MW-5 and offsite well MW-6 on the western side of San Pablo Avenue for the purpose of evaluating dissolved-phase gasoline constituents in the down-gradient groundwater flow direction.

Analytical results from collected soil samples did not identify petroleum hydrocarbon constituents above laboratory reporting limits.

- June 1993: RESNA observed the installation of SVE wells VW-7 through VW-9 and air sparge/SVE wells AS-1 and AS-2.
- August 1993: RESNA performed an air sparge/soil vapor extraction (AS/SVE) pilot test at the Site to evaluate the feasibility of utilizing air sparging in conjunction with SVE. Results of the test indicated air sparging was a viable option.
- November 1993: Construction of a groundwater extraction system (GWE) and an AS/SVE remediation system were completed at the Site. A total of nine vapor extraction wells (VW-1 through VW-9), one groundwater extraction well (RW-1), and two air sparge wells (AS-1 and AS-2) were connected to the system. The AS/SVE system was started in December 1993, however according to historical reports the GWE system was never operated. The AS/SVE system operated intermittently through February 2004, when it was shut down due to low influent concentrations. A reported 3,967 pounds of TPHg and 528 pounds of benzene were removed from beneath the Site during AS/SVE operation.
- March 2009: Broadbent & Associates, Inc. (BAI) observed the installation of wells MW-7 through MW-9 for the purpose of evaluating the remedial effectiveness of the AS/SVE system which operated between 1993 and 2004. Based on analytical data from collected soil and groundwater samples, remediation activities were deemed successful. BAI recommended the AS/SVE system be shut down permanently and that monitored natural attenuation be continued at the Site.
- March 2011: BAI, conducted a soil vapor intrusion assessment in the vicinity of the onsite building to evaluate the potential for a benzene vapor intrusion and possible vapor inhalation risk. Based on analytical data from collected soil vapor samples, BAI concluded vapor intrusion to indoor air was not a risk.

## **3.0 ENVIRONMENTAL CONDITIONS**

### **3.1 Extent of Groundwater Impact**

Analytical data<sup>4</sup> suggest that the constituents of concern in soil and groundwater are gasoline range organics (GRO) and benzene. The maximum concentrations of constituents of concern are

---

<sup>4</sup> BAI, *Second Quarter 2011 Semi-Annual Monitoring Report* (July 2011).

reported in groundwater samples obtained from wells RW-1, MW-8 and S-5<sup>5</sup>. The dissolved contaminant plume is adequately delineated by the existing well network and is defined in the down-gradient direction to below laboratory reporting limits for GRO, benzene, and MTBE by well MW-6. A regression analysis using GRO and benzene data from wells MW-8 and S-5 was performed to evaluate if a decreasing concentration trend with respect to time is present and if concentrations will reach Water Quality Objectives in a reasonable time. The analysis indicates reported constituent concentrations in groundwater samples from site monitor wells evaluated exhibit an overall decreasing trend and Water Quality Objectives for GRO and benzene will be achieved within a reasonable time frame. Regression analysis graphs are presented in Attachment F.

Based on the hydraulic gradient mentioned in Section 1.4, Site monitoring wells with screen intervals penetrating an aquitard present at about 12 to 18 feet bgs may likely facilitate the exchange of groundwater between the shallow and deeper water-bearing zones. Constituent concentrations in groundwater samples from wells screened into the deeper (old alluvium) water-bearing zones (e.g., wells MW-1, MW-2 and MW-3) generally report concentrations below laboratory reporting limits while the wells screened in the shallow zone report elevated concentrations (e.g., MW-7 and MW-8). A groundwater Elevation Contour and Analyses Map depicting the second quarter 2010 data for both the ARCO and Shell Sites is included as Figure 2 in Attachment A. Historical groundwater monitoring data is presented in Attachment C.

### **3.2 Extent of Soil Impact**

Approximately 350 cubic yards of soil was excavated during dispenser and piping upgrades and UST replacement in 1991 and an additional 3,967 pounds of TPHg and 528 pounds of benzene were removed as soil vapor during AS/SVE remediation between 1993 and 2004.

Remaining soil impacts are limited to the locations of the former USTs, dispenser, and product piping that were present in the northern portion of the Site. Soil impacts appear to be adequately defined both laterally and vertically by up-gradient and cross-gradient borings and are limited to the depth range of approximately 10 to 15 feet bgs. Data indicate the affected soil is contained to the shallow recent alluvium hydrologic unit and adequately defined both laterally and vertically. Historical soil analytical data are presented in Tables 2 and 3. Soil sample locations are shown on Plate 3 in Attachment A.

---

<sup>5</sup> S-5 is an off-Site Shell Branded groundwater monitoring well cross-gradient form ARCO Station No. 2035. Analytical data from the Shell-branded station reported GRO, benzene, toluene and ethylbenzene however, concentrations in the cross-gradient well and down-gradient wells for the ARCO Site exhibit an overall decreasing trend with respect to time.

## 4.0 EXPOSURE PATHWAY EVALUATION

Closure Solutions has prepared the following table to outline the potential human health exposure pathways, and evaluate whether such pathways are complete or significant.

Potential Exposure Medium	Potential Exposure Pathway	Pathway Evaluation
Groundwater	Ingestion	<b>Pathway Incomplete:</b> Impacted groundwater not reasonably expected to impact existing drinking water wells as no wells are identified within a ½-mile radius of the Site.
	Dermal Contact	
Subsurface Soil	Ingestion	<b>Pathway Incomplete:</b> Site is currently paved and current land use is not expected to change in foreseeable future.
	Dermal Contact	
Soil Vapor	Intrusion into Indoor Air	<b>Comparatively Insignificant:</b> Potential exposure to soil vapor likely insignificant when compared with exposure associated with current Site use as a retail gasoline service station.

### 4.1 Groundwater

The groundwater exposure pathway is considered incomplete. No supply wells were identified within a ½-mile radius of the Site. Shallow groundwater is not currently used as a source of drinking water or other beneficial use and it is unlikely to be used as such in the foreseeable future. Dermal contact with affected groundwater is unlikely given that the depth to groundwater is typically 10 feet bgs and the site and vicinity are paved.

Though dissolved-phase concentrations of gasoline constituents, including MTBE, currently exceed Water Quality Objectives in groundwater samples obtained from some site monitoring wells, when assessed in the context of site conditions, groundwater with these reported concentrations do not pose a significant threat to human health, safety, or the environment.

### 4.2 Subsurface Soil

The subsurface soil exposure pathway is considered incomplete based on soil concentrations, Site use, and the presence of asphalt or concrete covering the affected area. Constituents of concern reported in the soil samples (post AS/SVE remediation) collected in 2009 are below the SFRWQCB Environmental Screening Levels (ESLs) for Direct Exposure Soil Screening Levels for commercial/industrial (450 mg/kg for TPHg) and construction/trench workers (4,200 mg/kg

for TPHg [Tables K-2 and K-3]). Additionally, the land use is not expected to change in the foreseeable future and any current or future workers who perform construction related activities on gasoline service stations are required to have appropriate hazardous materials training, therefore appropriate protective measures would be in place prior to performing work. The SFRWQCB ESL tables are included as Attachment D.

#### **4.3 Soil Vapor**

This pathway is considered insignificant based on current groundwater concentrations at the Site. Benzene is considered the constituent to be of most concern to onsite workers as a potential threat to human health. A maximum reported benzene concentration of 290 micrograms per liter (ug/L) was reported for the recent groundwater sample obtained from well MW-8, near the northwest corner of the site. This concentration is at least one order of magnitude below the Regional Board's ESL for "Groundwater Evaluation for Potential Vapor Intrusions Concerns" for both commercial/industrial land use (1,800 ug/L). Additionally, a soil vapor intrusion assessment conducted in the vicinity of the onsite building by BAI in March, 2011, concluded vapor intrusion to indoor air was not a viable threat. Tabulated analytical data from the March 2011 soil vapor assessment are included in Attachment E and the SFRWQCB ESL tables are included in Attachment D.

### **5.0 OBSERVATIONS AND CONTENTIONS**

Based on analytical data from Site investigations, groundwater monitoring and other environmental corrective actions performed at the Site to date, several key observations and contentions may be supported. The observations and contentions are presented below, along with the justification supporting each observation or contention.

***Residual contaminations remain localized to the areas of the USTs, dispensers, and product piping.*** Soil impacts are primarily located in fine-grained soil between approximately 10 to 15 feet bgs. As indicated by soil samples collected from borings MW-7 through MW-9 the residual hydrocarbons in on-site soil have significantly decreased since the operation of SVE system between 1997 and 2004<sup>6</sup>.

***At least two distinct hydrologic units exist beneath the Site, including an unconfined groundwater bearing zone at about 5 to 10 feet bgs, and a confined groundwater bearing zone at about 18 to 20 feet bgs.*** Logs of Site borings and water level elevation and water quality data support the hypothesis that two distinct water bearing zones are present at the Site.

---

<sup>6</sup> Soil & Ground-Water Investigation Report, BAI, May 20, 2009

***There is little likelihood that the deeper confined groundwater encountered in the old alluvium will be materially affected by the remaining residual petroleum hydrocarbon release provided site wells are properly sealed.*** The potentiometric head for wells screened in the deeper zone is typically lower than the head for the shallower screened wells (i.e. MW-1 and MW-7).

***The shallow affected groundwater is not presently used as a source of drinking water or other beneficial use, and it is highly unlikely it will be used as such in the foreseeable future.*** The majority of the East Bay Plain cities do not have "...any plans to develop local groundwater resources for drinking water purposes because of existing or potential saltwater intrusion, contamination, or poor or limited quantity.<sup>7</sup>" A 2011 sensitive receptor survey did not identify any water wells within a ½ mile of the Site.<sup>8</sup> Even if groundwater resources were to be developed at or in the vicinity of the site, well construction standards requiring a minimum 50 foot sanitary seal would serve to isolate the shallow affected groundwater from deeper groundwater production zones.

***Considering the geology, hydrology, and land use at and in the vicinity of the Site, the residual gasoline constituents remaining in fine-grained soil and shallow groundwater do not and will not threaten human health, safety, and environmental receptors.*** During the March 2011 soil vapor survey, analytical results of the two soil gas samples that were collected adjacent to the existing station building were lower than the ESLs indicating that the vapor intrusion to indoor air is not an issue of concern at the site.<sup>9</sup> The down-gradient extent of dissolved-phase gasoline constituents in shallow groundwater is defined to below laboratory reporting limits at the location of well MW-6. Dissolved-phase gasoline constituents are stable or exhibit decreasing trends in site wells.<sup>10</sup> The site and vicinity is paved with asphalt and concrete.

***The Site has been adequately characterized for the purpose of evaluating threats to human health and environmental receptors.*** Based on analytical results from the Second Quarter 2011 sampling event the down-gradient extent of dissolved-phase gasoline constituents does not extend to well MW-6 and GRO and BTEX constituents in all wells continue to show stable to decreasing trends. MTBE was not reported above Water Quality Objectives during the Second Quarter 2011 groundwater sampling event.

***Case closure would be consistent with State Water Board Resolution No. 92-49 and with the maximum benefit to the people of the state.*** Although groundwater in the immediate vicinity of

the former UST location and dispenser island may exceed Regional Board Basin Plan Water Quality Objectives, given the nature of the release and the site's geology and hydrology, Water Quality Objectives will be achieved in a reasonable period of time. Shallow affected site groundwater is not currently being used as a source of drinking water and it is highly unlikely that the water will be used as a source of drinking water in the future.

## **6.0 LIMITATIONS**

This report is based on Site conditions, data, and other information available as of the date of the report, and the conclusions and recommendations herein are only applicable to the time frame in which the report was prepared. Background information used to prepare this report including, but not limited to, previous field measurements, analytical results, Site plans and other data have been furnished to Closure Solutions by ARC and their previous consultants. Closure Solutions has relied on this information as furnished, and is neither responsible for nor has confirmed the accuracy of this information.

If you have any questions regarding this submission, please feel free to contact Mr. Dennis Parfitt at (916) 760-7579 ([dparfitt@closuresolutions.com](mailto:dparfitt@closuresolutions.com)) or Ms. Kathleen Waldo at (916) 760-7025 ([kwaldo@closuresolutions.com](mailto:kwaldo@closuresolutions.com)).

Sincerely,  
**Closure Solutions, Inc.**

### **Soil Boring Logs and Well Construction Details**

# UNIFIED SOIL CLASSIFICATION SYSTEM

MAJOR DIVISIONS		LTR	DESCRIPTION		MAJOR DIVISIONS		LTR	DESCRIPTION	
Coarse-grained soils	Gravel and gravelly soils	GW	Well-graded gravels or gravel-sand mixtures, little or no fines		Fine-grained soils	Silts and clays LL<50	ML	Inorganic silts and very fine sands, rock flour, silt or clayey fine sands or clayey silts with slight plasticity	
		GP	Poorly-graded gravels or gravel-sand mixtures, little or no fines				CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays	
		GM	Silty gravels, gravel-sand-silt mixtures				OL	Organic silts and organic silt-clays of low plasticity	
		GC	Clayey gravels, gravel-sand-clay mixtures				MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts	
	Sand and sandy soils	SW	Well-graded sand of gravelly sands, little or no fines			Silts and clays LL>50	CH	Inorganic clays of high plasticity, fat clays	
		SP	Poorly-graded sands or gravelly sands, little or no fines				OH	Organic clays of medium to high plasticity, organic silts	
		SM	Silty sands, sand-silt mixtures				PT	Pest and other highly organic soils	
		SC	Clayey sands, sand-clay mixtures		Highly organic soils				

	Depth through which sampler is driven		Sand pack
	Relatively undisturbed sample		Bentonite annular seal
	No sample recovered		Neat cement annular seal
	Static water level observed in well		Caved native soil
	Initial water level observed in boring		Blank PVC
S-10	Sample number		Machine-slotted PVC
		P.I.D.	Photoionization detector

BLOWS REPRESENT THE NUMBER OF BLOWS OF A 140-POUND HAMMER FALLING 30 INCHES TO DRIVE THE SAMPLER THROUGH EACH 6 INCHES OF AN 18-INCH PENETRATION.

DASHED LINES SEPARATING UNITS ON THE LOG REPRESENT APPROXIMATE BOUNDARIES ONLY. ACTUAL BOUNDARIES MAY BE GRADUAL. LOGS REPRESENT SUBSURFACE CONDITIONS AT THE BORING LOCATION AT THE TIME OF DRILLING ONLY.

Symbols & Abbreviations:

-- = Not analyzed/applicable/measured/available

< = Not detected at or above laboratory reporting limit

ft bgs = Feet below ground surface

BTEX = Benzene, toluene, ethylbenzene and xylenes

DO = Dissolved oxygen

DTW = Depth to water in ft bgs

GRO = Gasoline range organics, range C4-C12

GWE = Groundwater elevation measured in ft

mg/L = Milligrams per liter

MTBE = Methyl tert butyl ether

NP = Not purged before sampling

P = Purged before sampling

TOC = Top of casing measured in ft

TPH-g = Total petroleum hydrocarbons as gasoline, analyzed using EPA Method 8015, Modified

µg/L = Micrograms per liter

SEQ/SEQM = Sequoia Analytical/Sequoia Morgan Hill Laboratories

Footnotes:

a = Site resurveyed by URS on 10/15/03 to NAVD '88

b = Sheen in well

c = Sample taken from VOA vial with air bubble >6mm

d = Well surveyed on 4/20/09

e = Well not monitored or sampled due to traffic control safety concerns

f = Samples were collected on 11/30/2010 but not able to be analyzed (frozen). Subsequent re-sampling could not occur in 4Q 2010

g = Quantitation of unknown hydrocarbon(s) in sample based on gasoline

lw = Quantitated against gasoline

Notes:

No sampling occurs at this site during the first and third quarters of each calendar year

TPH-g analyzed using EPA Method 8015, Modified and BTEX and MTBE by EPA method 8260B

Beginning in the fourth quarter 2003, the laboratory modified the reported analyte list. TPH-g was changed to GRO. The resulting data may be impacted by the potential of non-TPH-g analytes within the requested fuel range resulting in a higher concentration being reported

Beginning in the second quarter 2004, the carbon range for GRO was changed from C6-C10 to C4-C12

Values for DO and pH were obtained through field measurements

GRO analysis was completed by EPA method 8260B (C4-C12) for samples collected from the time period April 2006 through February 4, 2008. The analysis for GRO was changed to EPA method 8015B (C6-C12) for samples collected from the time period February 5, 2008 through the present

The data within this table collected prior to April 2006 was provided to Broadbent & Associates, Inc. by Atlantic Richfield Company and their previous consultants. Broadbent & Associates, Inc. has not verified the accuracy of this information

Symbols & Abbreviations:

-- = Not analyzed/applicable/measured/available

< = Not detected at or above the laboratory reporting limit

1,2-DCA = 1,2-Dichloroethane

DIPE = Di-isopropyl ether

EDB = 1,2-Dibromoethane

ETBE = Ethyl tert-butyl ether

MTBE = Methyl tert-butyl ether

TAME = tert-Amyl methyl ether

TBA = tert-Butyl alcohol

µg/L = Micrograms per Liter

Footnote:

a = Calibration verification for ethanol was within method limits but outside contract limits

b = Sample taken from VOA vial with air bubble > 6mm diameter

c = LW Quantitated against gasoline

Notes:

All volatile organic compounds analyzed using EPA Method 8260B

The data within this table collected prior to April 2006 was provided to Broadbent & Associates, Inc. by Atlantic Richfield Company and their previous consultants. Broadbent & Associates, Inc. has not verified the accuracy of this information

**Notes:**

High permeability soil: One meter dry sandy soil (92% sand, 5% silt, 3% clay) over one meter moist clayey loam (33% sand, 34% silt, 33% clay).

Screening levels calculated using spreadsheet provided with *User's Guide for the Johnson and Ettinger Indoor Air model (1991) for Subsurface Vapor Intrusion Into Buildings* (USEPA 2003). Assumed vadose-zone thickness/depth to groundwater three meters.

Physical state of chemical at ambient conditions (V - volatile, NV - nonvolatile, S - id, L - liquid, G - gas).

Chemical considered to be volatile if Henry's Law constant (atm m<sup>3</sup>/mole) >10<sup>-5</sup> and molecular weight <200.

Dibromochloromethane, dibromochloropropane and pyrene considered volatile for purposes of modeling (USEPA 2004).

Target cancer risk = 1E-06, Target Hazard Quotient = 0.2

**Table K-2. Direct Exposure Soil Screening Levels  
Commerical/Industrial Worker Exposure Scenario**

**Primary source:** USEPA Region 9 Preliminary Remediation Goals (PRGs, USEPA 2004), modified as noted below. See text for discussion.

**Notes:**

See text for equations and assumptions used in models.

Final screening level is lowest of individual screening levels for carcinogenic effects and noncarcinogenic effects (based on HQ=0.2)

Saturation limit used as upper limit for volatile organic compounds that are liquid at ambient conditions (see text).

Carcinogens: Based on target cancer risk of  $10^{-6}$ ; modified with respect to CalEPA/OEHHA slope factors when available (marked by \*\*). Screening levels for

PCBs based on updated USEPA slope factors as presented in USEPA Region IX Preliminary Remediation Goals document (USEPA 2004).

Noncarcinogens: Adjusted to target hazard quotient of 0.2 for use in tables for all chemicals. Screening levels based on hazard quotient of 1.0 provided for reference.

Saturation: Theoretical soil saturation level in the absence of free product; calculated for volatile organic compounds that are liquids under ambient conditions (refer to Table J).

TPH:Total Petroleum Hydrocarbons.

Direct-exposure screening level for lead from USEPA Region 9 Preliminary Remediation Goals document (USEPA 2004).

**Primary source:** USEPA Region 9 Preliminary Remediation Goals (PRGs, USEPA 2004), modified as noted below. See text for discussion.

**Notes:**

See text for equations and assumptions used in models.

Final screening level is lowest of individual screening levels for carcinogenic effects and noncarcinogenic effects (based on HQ=0.2) or screening level for construction/trench workers if lower (see Table K-3). Saturation limit used as upper limit for volatile organic compounds that are liquid at ambient conditions (see text).

Carcinogens: Based on target cancer risk of  $10^{-6}$ ; modified with respect to CalEPA/OEHHA slope factors when available (marked by \*\*"). Screening levels for

PCBs based on updated USEPA slope factors as presented in USEPA Region 9 Preliminary Remediation Goals document (USEPA 2004).

Noncarcinogens: Adjusted to target hazard quotient of 0.2 for use in tables for all chemicals. Screening levels based on hazard quotient of 1.0 provided for reference

Saturation: Theoretical soil saturation level in the absence of free product; calculated for volatile organic compounds that are liquids under ambient conditions (refer to Table J).

TPH: Total Petroleum Hydrocarbons. See text for discussion of different TPH categories.

Notes:

(1) GRO analysis by EPA TO-3; Benzene through Ethanol analysis by EPA TO-15; He/Q+Ar/CO<sub>2</sub>/CH<sub>4</sub> analysis by ASTM D-1946.

(2) <X = Not detected above the given laboratory reporting limit (X) in milligrams per cubic meter (mg/m<sup>3</sup>)

(3) ESL-Com = Environmental Screening Level for shallow soil gas (commercial or industrial land use); from California Regional Water Quality Control Board, San Francisco Bay Region (SFBRWQCB), May 2008.

(4) n/a = ESL not available or not applicable.
