ATTN: John Adams

Following is the result of analysis on the sample described below.

Project:

330-41.01

Lab Number:

S9-Ø1-15Ø-Ø1

Sample Type:

Soil

Date Received:

1/17/89 Analysis Requested: High Boiling Hydrocarbons, Oil and Grease

The method of analysis for high boiling hydrocarbons in soil involves extracting the sample with acetone. The mixture is partitioned with hexane and the resulting extract is examined by gas chromatography using a flame ionization detector.

The method of analysis for oil and grease in soil is taken from EPA Method 3550 and Standard Methods Section 503E. The sample is extracted with repeated portions of 50:50 methylene chloride:acetone using a horn-type sonicator. The extract is dried with sodium sulfate and treated with silica gel to remove polar compounds. Following evaporation, oil and grease is determined gravimetrically.
