RE: Preliminary Ground Water Investigation at  
Former Mobil Service Station #10-KNK  
7197 Village Parkway  
Dublin, California

Dear Mr. Pao:

This report presents the results of our soil and ground water investigation for the referenced site in accordance with proposal KEI-P88-1206.P1 dated January 11, 1989. The purpose of the investigation was to determine if the ground water has been impacted, and to determine the ground water flow direction. The work performed consisted of the following:

Coordination with regulatory agencies.

Drilling, installation and development of three monitoring wells.

Soil sampling.

Ground water monitoring, purging and sampling.

Laboratory analyses.

Data analysis, interpretation and report preparation.

### SITE DESCRIPTION AND BACKGROUND

The subject site is presently used as a gasoline station. The site vicinity and site details are shown on the attached sketches.

KEI-P88-1206.R2  
October 17, 1989  
Page 2

In December, 1988 Kaprealian Engineering, Inc. (KEI) was hired to obtain soil samples from beneath a 280 gallon waste oil tank during replacement of the existing tanks. The soil samples from beneath the waste oil tank showed 550 ppm total oil and grease (TOG).

KEI returned to the site on December 15, and again on December 20, 1988 for additional sidewall samples following soil excavation as required by the Alameda County Health Agency (ACHA). Five sidewall samples, labeled SW1, SW2, SW3, SW3A and SW4, were taken at a depth of approximately 10 feet. Soil was excavated from 1 to 6 feet laterally into the tank pit sidewalls from grade to a depth of approximately 11 feet.

To comply with the requirements of the regulatory agencies and based on results of the preliminary investigation, KEI proposed installation of three monitoring wells. Results of the soil samples from the tank excavation are summarized in KEI's report KEI-J88-1206.R1 dated January 11, 1989.

#### FIELD ACTIVITIES

On August 29, 1989, three 2" diameter monitoring wells (designated as MW1, MW2 and MW3 on the attached Site Plan) were installed at the site. The wells were drilled, constructed and completed in accordance with the guidelines of the Regional Water Quality Control Board (RWQCB) and the County well standards.

The subsurface materials penetrated and details of the construction of the wells are described in the attached Boring Logs.

The three wells were each drilled and completed to a total depth of 26 feet. Ground water was encountered at depths ranging from approximately 13 to 14 feet beneath the surface during drilling activities. Soil samples were taken at approximately five foot intervals or less beginning at a depth of approximately 5 feet below grade until ground water was encountered. The undisturbed soil samples were obtained by driving a California-modified split-spoon sampler ahead of the drilling augers. The 2" diameter brass liners holding the samples were sealed with aluminum foil, plastic caps and tape, and stored in a cooled ice chest for delivery to a certified laboratory. Each well casing was installed with a watertight cap and padlock. A round, watertight, flush-mounted well cover was cemented in place over each well casing.

The wells were developed on September 5, 1989. Prior to development, the wells were checked for depth to the water table using an electronic sounder, presence of free product (using paste tape) and sheen. No free product or sheen was noted in any of the wells. After recording the monitoring data, the wells were developed with a surface pump until the evacuated water was clear and free of suspended sediment. Monitoring and well development data are summarized in Table 1.

The wells were sampled on September 6, 1989. Prior to sampling, monitoring data were taken and water samples were then collected using a clean Teflon bailer. The samples were decanted into clean glass VOA vials and one liter amber bottles, sealed with Teflon lined screw caps, and labeled and stored on ice until delivery to a certified laboratory.

#### ANALYTICAL RESULTS

Water and selected soil samples were analyzed at Sequoia Analytical Laboratory in Redwood City, California. All samples were accompanied by properly executed Chain of Custody documentation. Samples were analyzed for TPH as gasoline by EPA method 5030 in conjunction with modified 8015 and BTX&E by EPA method 8020, TPH as diesel using EPA method 3510 in conjunction with modified 8015, TOG using EPA method 503D&E in soil and 503A&E in water, and purgeable halocarbons using EPA method 8010.

Soil sample analyses showed levels of TPH as gasoline ranging from non-detectable in MW1, and 3.7 to 17 ppm in MW2 and MW3. TPH as diesel ranged from non-detectable in MW3 and 1.5 to 36 ppm in MW2 and MW3; however, TOG was detected in all samples and levels ranged from 35 ppm to 4,000 ppm. EPA 8010 was non-detectable for all samples. Results of soil analyses are summarized in Table 2. Water sample analyses showed non-detectable levels of TPH as gasoline and BTX&E in all samples except MW3, which had 110 ppb of TPH as gasoline. TPH as diesel was non-detectable in all wells except MW1, which was 140 ppb. Detected levels of TOG ranged from 6.7 ppm to 8.1 ppm. EPA 8010 constituents were non-detectable for all samples. Results of the water analyses are summarized in Table 3. Copies of the laboratory analyses and Chain of Custody documentation are attached to this report.

#### HYDROLOGY AND GEOLOGY

The water table stabilized in the monitoring wells at depths ranging from 8.82 to 9.30 feet below the surface. The ground water flow direction appeared to be toward the northwest (based on water level data collected from the three monitoring wells on September 5, 1989).

Subsurface earth materials at the site are interpreted as Quaternary alluvium consisting predominantly of clay with minor silt and sand lenses to the total depth explored (26 feet). Based on review of U.S.G.S. Professional Paper 943, the site is underlain by fine-grained alluvium (Qah). Artificial fill materials at the site vary in thickness from 1.5 to 3 feet.

#### DISTRIBUTION

Copies of this report should be sent to the Alameda County Water District, and to the RWQCB, San Francisco Bay Region.

#### LIMITATIONS

Soil deposits and rock formations may vary in thickness, lithology, saturation, strength and other properties across any site. In addition, environmental changes, either naturally-occurring or artificially-induced, may cause changes in ground water levels and flow paths, thereby changing the extent and concentration of any contaminants. Our studies assume that the field and laboratory data are reasonably representative of the site as a whole, and assume that subsurface conditions are reasonably conducive to interpolation and extrapolation.

The results of this study are based on the data obtained from the field and laboratory investigations. We have analyzed this data using what we believe to be currently applicable engineering techniques and principles in the Northern California region. We make no warranty, either expressed or implied, except that our services have been performed in accordance with generally accepted professional principles and practices existing for such work.
