1.0 INTRODUCTION

Antea Group has prepared this Focused Site Conceptual Model - Draft as requested in an email from the Alameda County Health Care Services Agency (ACHCSA), dated January 13, 2014. A copy of this email is presented as **Appendix A**. The purpose of this report is to review data gaps associated with the site as discussed with the ACHCSA in a meeting held on January 13, 2014.

1.1 Site Description

The site is located on the southeast corner of the intersection of Lakeshore Avenue and Lake Park Avenue in Oakland, California (**Figure 1**). The site is bounded to the north by Lakeshore Avenue; to the west and southwest by Lake Park Avenue; to the southeast by a supermarket parking lot; and to the east by a pharmacy. Station facilities include a service station building with one service bay, three fuel dispenser islands, and two 12,000-gallon double-wall fiberglass, gasoline underground storage tanks (USTs) (**Figure 2**).

2.0 PLUME STABILITY

2.1 Free Product

Historically, free product has been observed in on-site monitoring wells U-1 and U-2. Free product was first observed in monitoring well U-1 in March 1995 at a thickness of 0.36 feet. The maximum thickness of free product in monitoring well U-1 was reported in March 1997 at 0.55 feet. Measurable free product has not been observed in monitoring well U-1 since March 1998 when it was reported at a thickness of 0.03 feet. Measurable free product in monitoring well U-2 has only been reported during one sampling event, March 1997 at a thickness of 0.02 feet. Measurable free product has not been observed in monitoring wells U-3 through U-6. Historical groundwater gauging and analytical data is presented as **Appendix B**.

Depth to water in monitoring well U-1 ranged from 6.88 feet below top of casing (btoc) to 9.30 feet btoc during the events where measurable free product was present in the well. There does not appear to be a correlation between the depth to water and the presence of measurable free product. The depth to water reported while free product was present in the well are within historical and present day water levels. The reported depth to water during the third quarter 2013 monitoring and sampling event was 8.59 feet btoc.

Depth to water in monitoring well U-2 was reported at 7.11 feet btoc during the March 1997 sampling event, when free product was observed. This reported depth to water is within historical and present day water levels and does not suggest that there is a correlation between the depth to water and presence of free product in monitoring well U-2. The depth to water reported during the third quarter 2013 monitoring and sampling event was 7.16 feet btoc.

2.2 Groundwater Flow

Groundwater flow at the site has been interpreted to be radially outward during 14 monitoring and sampling events conducted at the site since the first quarter 2004. Historical groundwater elevation contour maps are presented as **Appendix C**. In reviewing topographic maps of the area and elevation data available on Google Earth, it appears that there is a slight ridge that runs through the center of the site from the southeast to the northwest. Based on the elevation data the trend for groundwater flow is interpreted as radially outward, south-southwest and north-northeast. It appears that groundwater flow typically follows the surface contours. If the plume were migrating off-site, it would be expected that concentrations of contaminants of concern (COCs) would increase in monitoring well U-3, U-6, and possibly U-5. These monitoring wells are located radially out from the plume center surrounding monitoring wells U-1 and U-2. However, in reviewing historical analytical data, concentration in monitoring wells U-5 and U-6 have decreased over time and concentrations in monitoring well U-3 have historically been below the laboratory's indicated reporting limits except for methyl tertiary-butyl ether (MTBE) and three detections of total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and total xylenes (BTEX).

2.3 Contaminants of Concern

The COCs for this site include TPHg, MTBE, and tertiary-butyl alcohol (TBA). Concentration vs. Time graphs for TPHg, MTBE, TBA, and depth to water (DTW) since 2005 for monitoring wells U-1, U-2, U-5, and U-6 are presented as **Appendix D**. Isoconcentration maps for TPHg, MTBE, and TBA are presented on **Figures 3 through 5**. Based on the trend graphs, concentrations of TPHg, MTBE, and TBA appear to be decreasing over time in monitoring wells U-1, U-2, U-5, and U-6. There also does not appear to be a definite correlation between DTW and COC concentrations reported in the monitoring wells. TBA concentrations in the four monitoring wells may have correlated to DTW in 2005, however, TBA was not analyzed on a regular basis between 2006 and 2009, and since 2009, it does not appear as if TBA concentrations correlate to DTW.

3.0 PREFERENTIAL PATHWAYS AND SENSITIVE RECEPTORS

3.1 Sanitary Sewer

The sanitary sewer main runs along the center of Lakeshore Avenue northeast to southwest. Antea Group conducted a utility survey on February 19, 2014 to try and identify the depth of the sanitary sewer. Given the location of the sanitary sewer main being in the middle of Lakeshore Avenue, it was not possible to ascertain the depth of the sanitary sewer main. Antea Group contacted the City of Oakland in an attempt to ascertain the depth of the sanitary sewer main; however, the maps that the City of Oakland uses do not show the depth of the utility lines. The Alameda County Environmental Health (ACEH) case file contained a report titled MISC_R_1997-02-28 which contained survey data of the sanitary sewer and storm drain in Lakeshore Avenue. According to the report, the bottom of the sanitary sewer main is located at a depth of 2.29 feet below ground surface (bgs).

3.2 Storm Drain

A storm drain runs along the sidewalk on the southeast side of Lakeshore Avenue. There are two storm drain inlets located next to the site. One on the corner of Lakeshore Avenue and Lake Park Avenue and a second inlet on the east side of the first driveway onto the site from Lakeshore Avenue. The storm drain is approximately 2.5 feet bgs at the inlet next to the driveway and the bottom of the storm drain main is approximately 4 feet bgs. The two storm drain inlets next to the site did not have markings indicated that the storm drain emptied into nearby Lake Merritt, however, several other storm drain inlets in the vicinity of the site did state that the storm drains emptied to the lake. Also, according to the City of Oakland, Lake Merritt receives water from 60 storm drain outfalls and over 4,650 acres drain into Lake Merritt. Antea Group is currently attempting to confirm with the City of Oakland that the storm drains located near the site do empty into the lake. A site plan with known utility locations and depths is presented on **Figure 6**.

3.3 Sensitive Receptors

In October 2013, Antea Group submitted a Sensitive Receptor Survey to the ACHCSA. In the report it was stated that no water supply, domestic, municipal, irrigation, or industrial wells were located within a half mile radius of the site based on data from the Alameda County Public Works Agency (ACPWA) or the Department of Water Resources (DWR). ACHCSA requested that Antea Group look for any wells within a one mile radius of the site. Review of the data from ACPWA and DWR identified three wells within a one mile radius of the site. Two of the wells are listed as domestic use wells and the third well

is listed as an irrigation well. The closest well is the irrigation well at 0.71 miles northeast of the site. The well identification number is 01-701. The domestic well identification numbers are 32531 and 378677 and are located approximately 0.92 mile south and 0.99 miles east-northeast of the site, respectively. The location of the wells in relation to the site is presented on **Figure 7**.

4.0 CONCLUSIONS

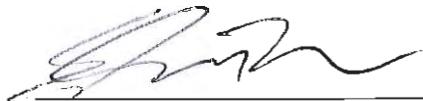

Antea Group has made the following conclusions in this Focused Site Conceptual Model- Draft:

- Free product has historically been observed in site monitoring wells, however measurable free product has not been observed since March 1998. The presence of measurable free product does not appear to correlate with the depth of water.
- TPHg, MTBE, and TBA concentrations in monitoring wells U-1, U-2, U-5, and U-6 show declining trends since 2005 and concentrations reported in the monitoring wells do not appear to be correlated to depth to water. Based on the concentrations reported in monitoring wells U-3, U-5, and U-6, it does not appear that plume is migrating off-site. In addition, based on the reported TPHg, MTBE, and TBA concentrations, the size of the plume appears to be shrinking.
- Sensitive receptors including two domestic wells and an irrigation well have been identified within one mile of the site, however, given their locations (up-gradient and cross-gradient), it is unlikely that they would be effected by impacted groundwater beneath the site.

5.0 REMARKS

The recommendations contained in this report represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the client. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this report. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this report.

Appendix A

Alameda County Health Care Services Agency Email, dated January 13, 2014

Dennis Dettloff

From: Nowell, Keith, Env. Health <Keith.Nowell@acgov.org>
Sent: Monday, January 13, 2014 4:39 PM
To: Dennis Dettloff
Cc: Roe, Dilan, Env. Health
Subject: Fuel Leak Case RO229, UNOCAL #5325, 3220 LAKESHORE AVE., OAKLAND , CA

Dear Mr. Dettloff,

Thank you and Mr. Ed Weyrens of Antea™ Group (Antea) for participating in the conference call this morning regarding fuel leak case for UNOCAL #5325, 3220 Lakeshore Drive, Oakland, Alameda County Environmental Health (ACEH) case number RO0000229. ACEH staff has reviewed the case files including the *Case Closure Request* (RFC), dated November 12, 2013, prepared by Antea for the subject Site. ACEH denied the RFC in a letter dated December 24, 2013 based on data gaps perceived by ACEH which questioned the completeness of the Site Conceptual Model (SCM) as it relates to the groundwater contaminant plume delineation and requested a meeting to discuss the Site with you.

Items which ACEH discussed during today's teleconference and wished to have addressed include:

Plume stability:

- Relationship of depth-to-water (DTW), direct and indirect free product observations, and concentrations of total petroleum hydrocarbons as gasoline (TPHg), methyl tertiary butyl ether (MTBE), and tertiary butyl alcohol (TBA) for groundwater monitoring wells U-1, U-2, U-5, and U-6;
- Review of the historic groundwater flow directions, radial outward flow, and the offsite migration of the contaminant plumes for TPHg, MTBE, and TBA;
- Concentrations plots for TPHg, MTBE, and TBA since 2005 using monitoring wells U-1, U-2, U-5, and U-6. As the data trend graphs for TPHg as plotted from Geotracker are misleading based in part on the lack of data in the time interval between 2010 and 2012, ACEH requests you do not use Geotracker as the source of the data trend plots.

Preferential Pathways:

- Identification of depth to- and location of- sanitary sewer and storm drains due to the shallow DTW at the Site. Please review the ACEH case file, including information contained in MISC_R_1997-02-28. PDF copies of case files can be reviewed at <http://www.acgov.org/aceh/lop/ust.htm>);
- Location(s) of storm drain discharge outlet(s).

Reporting:

- Preparation of a draft focused SCM addressing the above mentioned data gaps;
- Preparation of a figure on an aerial overlay showing locations of beneficial use wells within one mile of the Site, the location of Lake Merritt, and depicting the estimated plume boundaries for TPHg, MTBE, and TBA.

As discussed in our conference call, please provide ACEH (Attention: Keith Nowell) the information identified above in a draft document via email by February 14, 2014. Following ACEH's review, a follow up meeting will be scheduled to address how best to move the project toward closure in an expeditious manner. Please provide ACEH with contact information for Mr. Ed Weyrens if he continues to be involved with this project.

Thank you for your cooperation. Should you have any questions regarding this correspondence or your case, please call me at (510) 567-6764 or send an electronic mail message at keith.nowell@acgov.org.

Regards,
Keith Nowell

Gauging Notes:

TOC - Top of Casing

ft - Feet

NP - LNAPL not present

LNAPL - Light non-aqueous phase liquid

* - Corrected for LNAPL if present (assumes LNAPL specific gravity = 0.75)

NG - Not gauged

WI - Well Inaccessible

NSVD - Not surveyed

DRY - Well is dry

-- No information available

Analytical Notes:

< - Below Laboratory's indicated reporting limit

DRY - Well was Dry; sample could not be taken

LPH - Liquid Phase Hydrocarbons

ND - Not detected, and detection limit is not known

ug/L - micrograms/liter

TPHg - Total petroleum hydrocarbons as gasoline

MTBE - Methyl tertiary-butyl ether

DIPE- Di-isopropyl ether

ETBE- Ethyl tertiary-butyl ether

TAME- Tertiary-amyl methyl ether

TBA- Tertiary-butyl alcohol

Bold - Above the laboratory's indicated reporting limit
