Subject: Second Semi-Annual 2009 Groundwater Monitoring Report  
400 San Pablo Avenue, Albany, CA

Dear Jerry:

Enclosed is a copy of September 25, 2009 subject Second Semi-Annual Groundwater Monitoring and Sampling Report prepared by Enviro Soil Tech Consultants.

I declare, under penalty of perjury, that the information and/or recommendations contained in this report are true and correct to the best of my knowledge.

Sincerely,

A handwritten signature in black ink, appearing to read "M. Stevens".

Muray T Stevens, CEO

**SUBJECT: SECOND SEMI-ANNUAL OF 2009 GROUNDWATER  
MONITORING AT THE PROPERTY**

Located at 400 San Pablo Avenue, in  
Albany, California

Dear Mr. Stevens:

This report presents results of work performed during the second semi-annual of 2009. Groundwater monitoring and sampling was conducted on August 26, 2009.

A copy of this report must be forwarded to Regional Water Quality Control Board-San Francisco Bay Region (RWQCB-SFBR) and Alameda County Health Care Services Agency (ACHCSA) for their comments and recommendations.

## SITE DESCRIPTION

The site is located at 400 San Pablo Avenue, in Albany, California, approximately one mile east of San Francisco Bay. The site is bordered by El Cerrito Creek to the north, San Pablo Avenue to the east and Adams Street to the west. The surrounding area is occupied by primarily light commercial and residential buildings and the California School for the Blind.

## BACKGROUND

The site was vacant until the late 1950's when Plaza Car Wash and the adjacent Norge Dry Cleaners building were constructed. Three underground tanks for gasoline storage were installed in the northern part of the car wash property in 1970, and Plaza Car Wash began dispensing gasoline from a dispenser island located to the north of the car wash building (Figure 1).

Investigation at this site was prompted by an emergency response action in El Cerrito Creek on July 3, 1989. A small plume of immiscible liquid hydrocarbons was observed floating on the water surface just north of the dry cleaners property. The Albany Fire Department responded and installed absorbent materials and a containment boom around the plume. Subsequent inspection indicated that the hydrocarbon plume was entering the creek through a storm drain that discharges into the creek behind (northwest of) the dry cleaners. Investigation was then undertaken to discover the source of the plume.

The discovery and interim remediation of petroleum contamination in El Cerrito Creek was followed by several years of subsurface investigation and surface-water sampling by Enviro Soil Tech Consultants (ESTC) and others working on behalf of Kamur Industries.

Norge Dry Cleaners conducted no investigation of its own, but contamination beneath that property was investigated as part of the work being performed by Kamur Industries. Between 1989 and 2004, the underground gasoline storage tanks at the car wash were removed, gasoline-contaminated soil was excavated and disposed of, soil-vapor probes were installed and sampled, and soil borings and monitoring wells were drilled and sampled.

The extensive investigation performed on behalf of Kamur Industries produced a voluminous amount of data on groundwater flow patterns and soil and water contamination, and in August 2003, the ACEHSA requested Kamur Industries to submit a report summarizing the entire investigation. The purpose of the report was to enable ACEHSA to evaluate the status of the case and determine whether additional studies are needed to move the site toward case closure. Enviro Soil Tech Consultants submitted a report titled *Historical Events Report for Plaza Car Wash* in 2004 and revised it in May 2005. That report focused primarily on the tasks that had been performed and the procedures that were used, and ACEHSA subsequently requested a more comprehensive analysis of the site's hydrogeology and contamination history. ESTC completed a companion report titled *Site Conceptual Model for the Properties Located at 398 and 400 San Pablo Avenue* in February 2005.

ESTC submitted a Corrective Action Plan to ACEHSA in November 2007. A meeting to discuss the CAP and the current status of the project was held at the ACEHSA office in June 2008. The participants decided to put corrective action on hold at this time and instead perform additional investigation of the vertical and lateral extent of the groundwater impact. A work plan describing the proposed investigation was submitted in August 2008. This report presents the results of that additional investigation and includes the results of groundwater sampling in the first quarter of 2009.

## SCOPE OF WORK

- Measure the depth to groundwater in wells MW-2, MW-3, and STMW-1 through STMW-7, and check for hydrocarbon sheen or floating product.
- Purge the wells of standing water.
- Collect water samples from each well.
- Submit samples to a state-certified analytical laboratory for the following analyses: TPHg, BTEX, gasoline oxygenates, and chlorinated hydrocarbons.
- Review the results and prepare a report.

## GROUNDWATER MONITORING PROCEDURES AND RESULTS

ESTC staff monitored the wells on August 26. After the wells were opened, staff measured the depth to groundwater and purged each well. During purging, staff checked for the presence of floating product and/or any distinctive odor. The wells were purged of at least three well volumes of water and the purged water was stored in a large storage tank on site.

After purging, water samples were collected in a disposal bailer and transferred to 40-ml sample vials and stored in a cooled ice chest for later transmittal to the analytical laboratory.

Sampling equipment was decontaminated before and after sampling each well using Tri-sodium Phosphate (TSP) and water wash, followed by a double rinsing. Stringent chain-of-custody procedures were maintained during sample acquisition, storage and transport. The sampling was conducted in accordance with ESTC's Standard Operation Procedure (SOP) (Appendix "D") and ACHCSA's guidelines.

The depth to groundwater is tabulated in Table 2 and the groundwater elevation data are contoured in Figure 2. The static water level was a few inches deeper than in the first quarter.

Contouring the elevation data shows that the piezometric surface sloped to the southwest away from El Cerrito Creek (Figure 2). The elevation ranged between 13.8 feet on the northeast side of the creek to 11.6 feet at the southwestern well (STMW-7).

It is evident in Figure 2 that the elevation contours are spaced closer together southwest of the property boundary. This occurs because the depth of the static water level in STMW-7 was slightly greater than expected. Whether this truly means the slope of the piezometric surface is steeper southwest of the site is uncertain.

## **ANALYTICAL RESULTS**

The water samples from STMW-1 through STMW-4 and STMW-6 through STMW-7 were analyzed for TPHg and BTEX by EPA method 8015 and 8020. Samples from MW-2, MW-3, and STMW-5 were analyzed for these compounds plus MTBE and chlorinated hydrocarbons by EPA method 8260B. The results are summarized in Tables 1 and 2. The laboratory analytical report is included in Appendix "F", and the concentrations are contoured in Figures 3 and 4.

Hydrocarbon concentrations were essentially unchanged in STMW-2 through STMW-5 and in STMW-7, but were slightly higher in STMW-6 and MW-3 and substantially higher in STMW-1 (Table 1). Benzene was the only analyte that declined in STMW-1 this quarter. This increase would not be expected if the static water level in the well really did rise by nearly 3 feet, because such a rise would increase the volume of water and thereby decrease the hydrocarbon concentration. Hence, this is further indication that the water depth in STMW-1 was measured incorrectly.

## LIMITATIONS

This report and the associated work have been provided in accordance with the general principles and practices currently employed in the environmental consulting profession. The contents of this report reflect the conditions of the site at this particular time. The findings of this report are based on:

- 1) The observations of field personnel.
- 2) The results of laboratory analyses performed by a state-certified laboratory.

It is possible that variations in the soil and groundwater could exist beyond the points explored in this investigation. Also, changes in groundwater conditions of a property can occur with the passage of time due to variations in rainfall, temperature, regional water usage and other natural processes or the works of man on this property or adjacent properties.

This report is issued with the understanding that it is the responsibility of the owner or his/her representative to ensure that the information and recommendations contained herein are called to the attention of the Local Environmental Agency.

The services that ESTC provided have been in accordance with generally accepted environmental professional practices for the nature and conditions of the work completed in the same or similar localities, at the time the work was performed. This report is not meant to represent a legal opinion. No other warranty, express or implied is made.

## **A P P E N D I X "D"**

### **STANDARD OPERATION PROCEDURE**

**ENVIRO SOIL TECH CONSULTANTS**

## **GROUNDWATER SAMPLING**

Prior to collection of groundwater samples, all of the sampling equipment (i.e. bailer, cables, bladder pump, discharge lines and etc.) was cleaned by pumping TSP water solution followed by distilled water.

Prior to purging, the well "Water Sampling Field Survey Forms" were filled out (depth to water and total depth of water column were measured and recorded). The well was then bailed or pumped to remove four to ten well volumes or until the discharged water temperature, conductivity and pH stabilized. "Stabilized" is defined as three consecutive readings within 15% of one another.

The groundwater sample was collected when the water level in the well recovered to 80% of its static level.

Forty milliliter (ml.), glass volatile organic analysis (VOA) vials with Teflon septa were used as sample containers. The groundwater sample was decanted into each VOA vial in such a manner that there was a meniscus at the top. The cap was quickly placed over the top of vial and securely tightened. The VOA vials were then inverted and tapped to see if air bubbles were present. If none were present, the sample was labeled and refrigerated for delivery under chain-of-custody to the laboratory. The label information would include a sample identification number, job identification number, date, time, type of analysis requested and the sampler's name.
