**Soil Remediation  
Gasoline Tank Area  
Plywood & Lumber Sales, Inc.  
4050 Horton Street  
Emeryville, California**

Dear Ms. Hugo:

This letter summarizes the services provided by Subsurface Consultants, Inc. (SCI) during remediation of soils impacted by releases from a previous gasoline tank at the referenced site. SCI previously performed a Soil Contamination Assessment which defined the extent of soil contamination. The results of the assessment and proposed remediation work plan were presented in a report dated November 16, 1993. SCI's current scope of services consisted of observing contaminated soil excavation, obtaining confirmation samples from the limits of the final excavation, transmitting the samples to an analytical laboratory for petroleum hydrocarbons and lead analyses, and checking compaction during excavation backfilling.

Site Description

The site is situated on the east side of Horton Street in an industrial/commercial area of Emeryville. The southern portion of the site is occupied by a one-story office building with a concrete slab-on-grade floor. Asphalt concrete pavement and lumber storage areas occupy the remainder of the site. The previous underground gasoline storage tank was located beneath the sidewalk along Horton Street, as shown on Plate 1.

The adjacent property to the northeast is occupied by the Electro Coating, Inc. (ECI) facility. The ECI facility has been identified as a source of soil and groundwater contamination in the area.

■ Subsurface Consultants, Inc.

Ms. Susan Hugo

Services Agency  
August 18, 1994  
SCI 851.001  
Page 2

Previous studies by others have indicated that groundwater has been impacted by chromium and several volatile organic chemicals, specifically trichloroethylene (TCE), trichloroethane (TCA) and tetrachloroethylene (PCE). The groundwater contaminant plume has migrated off-site and extends onto the Plywood and Lumber Sales property.

Tank Area History

In December 1990, Zaccor, Inc. removed a 1000 gallon underground gasoline storage tank from the site. Confirmation samples obtained from the tank excavation indicated that soil had been impacted by petroleum hydrocarbons and lead. Subsequent investigations by SCI determined that the lateral extent of hydrocarbon contamination was localized to soils within about 30 feet of the tank.

Soil Remediation

Soil remediation was performed in general accordance with the work plan following the plans approval by the Alameda County Health Care Services Agency (ACHCSA). The only significant change in scope involved prequalifying soils containing petroleum hydrocarbons and relatively low concentrations of total lead for disposal at the B & J Landfill in Vacaville, California. Given the sites space restrictions, this facilitated these soils being directly offloaded without stockpiling.

Contaminated soils were excavated from the site in June 1994 by Redhorse Constructors, Inc., under subcontract to Sawyer General Contractors, Inc. Soils near the previous tank which contained relatively high lead concentrations were excavated and stockpiled on site. The resulting excavation was approximately seven feet deep and extended over the area shown on Plate 1.

Bottom and sidewall confirmation samples were obtained from the limits of the excavation and analyzed for total lead. Additionally, two samples (9 @ 7 feet and 7 @ 6 feet) were further analyzed for total volatile hydrocarbons, total extractable hydrocarbons, oil & grease and BTEX. Sample locations are shown on Plate 1. The analytical results are summarized in Table 1. A description of field and laboratory protocols, and analytical test reports are attached.

Following removal of the lead contaminated soils Redhorse Constructors, Inc. extended the excavation to remove the remaining hydrocarbon contaminated soil. The soil was directly loaded into trucks for direct disposal at the B & J Landfill; copies of the

Ms. Susan Hugo  
Alameda County Health Care  
Services Agency  
August 18, 1994  
SCI 851.001  
Page 3

non-hazardous waste manifests are attached. In general, the excavation was approximately 7.5 feet deep and extended over the area shown on Plate 2. The excavation was locally deepened to a depth of approximately 9 feet in the previous tank area to remove elevated concentrations of petroleum hydrocarbons.

Confirmation samples were obtained from the sidewalls and bottom of the final excavation. The soil samples were analyzed for the following:

1. Oil and Grease,
2. Total extractable hydrocarbons,
3. Total volatile hydrocarbons, and
4. Benzene, toluene, xylene, ethylbenzene.

Analytical test results are summarized in Table 1. The sample locations are shown on Plate 1. Analytical test reports are attached.

#### Excavation Water

Water accumulated in the deeper portion of the excavation during site activities. The water appeared yellowish in color which is typical of contaminated water within the ECI plume. Since the site is in a regional plume, and a groundwater investigation is to be performed upon completion of soil remediation, it was decided in consultation with Ms. Susan Hugo of ACHCSA that groundwater will be evaluated during future investigations.

#### Backfilling

Redhorse Constructors, Inc. backfilled the excavation with clean, imported fill. Due to water accumulating in the excavation, the lower foot of the excavation was backfilled with 3/4 inch crushed rock. The rock was overlain with a geotextile filter fabric. The fabric was overlapped a minimum 2 feet at its ends. Above the crushed rock, the fill consisted of an imported gravelly silty sand.

An SCI representative observed excavation backfilling and performed field density tests to check soil compaction. Laboratory compaction tests and check points were conducted in accordance with the ASTM D1557-78 test method to evaluate the optimum moisture content and maximum dry density of the fill material. Field density tests were performed using nuclear methods in accordance with the ASTM D2922-71 test method.

Ms. Susan Hugo  
Alameda County Health Care  
Services Agency  
August 18, 1994  
SCI 851.001  
Page 4

Based on the test results and our observations, we conclude that the fill placed under our observation was compacted to at least 90 percent relative compaction in accordance with our recommendations. Field and laboratory test data will be retained in our file for future reference, if necessary. A summary of the field density test data is presented in Table 2.

#### Soil Disposal

##### A. Lead Contaminated Soil

Approximately 130 tons of lead contaminated soil were stockpiled on-site. One composite sample of the stockpiled soil, consisting of four discrete samples (22, 23, 24, 25), was analyzed for the following:

1. Total volatile hydrocarbons - EPA 5030/8015,
2. Benzene, toluene, xylene and ethylbenzene - EPA 8020,
3. Total Lead
4. Soluble lead, (STLC and TCLP), and
5. Reactivity, corrosivity and ignitability.

The analytical test results are summarized in Table 1. The results indicated that the soluble threshold limit concentration (STLC) and the toxicity characteristic leaching potential (TCLP) for lead were 22,000 and 1,100 ug/l, respectively. Based on these concentrations, the soil was classified as non-RCRA hazardous waste.

In July 1994, Redhorse Constructors, Inc. loaded the soil into containers for transportation by truck and rail to the Class I ECDC Landfill Facility in East Carbon, Utah. The soil was transported under hazardous waste manifests, copies of which are attached.

##### B. Petroleum Hydrocarbon Contaminated Soil

The petroleum hydrocarbon impacted soils were pre-approved for disposal at the B & J Landfill in Vacaville. Approximately 600 tons of soil were directly offloaded to the landfill.

■ Subsurface Consultants, Inc.

Ms. Susan Hugo

SCI 851.001  
Page 5

Conclusions

Soil Remediation

Based on the analytical test results it appears that remedial activities have been successful at mitigating the hydrocarbon and lead contaminated soils at the site. The contaminant concentrations remaining in-place are sufficiently low that they should not pose a significant threat to groundwater quality or the environment.

Groundwater Assessment

In accordance with the approved work plan, one monitoring well will be installed downgradient of the former tank area. The well will be analyzed for TVH, TEH, O&G, BTEX and total lead on a quarterly basis. Additionally, the well will be analyzed for volatile organics (EPA 8240) and chromium during the first quarter of monitoring only.

Yours very truly,

Subsurface Consultants, Inc.

*Mallie*

■ Subsurface Consultants, Inc.  
**INVESTIGATION PROTOCOL**

**A. Excavation Sampling**

Soil samples from the sidewalls and bottom of the excavation were obtained using a backhoe bucket. Once the bucket was brought to rest at the groundsurface, approximately 3 inches of soil was scraped away and a clean 2-inch-diameter brass liner was driven into the material with a mallet. The liner was withdrawn and Teflon sheeting was placed over the liner ends. The ends were then capped and sealed with duct tape. The samples were refrigerated on-site and remained refrigerated until delivery to the analytical laboratory.

**B. Field Analysis for Organic Vapors**

Field monitoring of excavated soils were performed using an organic vapor meter (OVM). The field samples were placed in quart size plastic bags. The bags, half-filled with soil, were placed in a warm area and allowed to stand for at least five minutes. The bags were then opened, the OVM probe inserted, and organic vapor readings were taken.

**C. Analytical Testing**

Analytical testing was performed by Curtis & Tompkins, Ltd., a California Department of Health Services (DHS) certified laboratory for the tests performed. The analytical tests were directed toward contaminants encountered during SCI's previous studies. Accordingly, the tests included:
