Subject: Transmittal of Well Survey Results, Site Information Summary, and Request For Closure for the ConocoPhillips (76) Service Station No. 3292, located at 15008 East 14th Street, San Leandro, California

Dear Ms. Chu:

This document was prepared by Gettler-Ryan Inc. (GR) at the request of ConocoPhillips, and transmits the Well Survey Results and Site Information Summary (SIS), and based on the discussion and findings, also requests low-risk case closure status from the Alameda County Health Care Services (ACHCS).

The subject site is an active 76 service station located on the eastern corner of the intersection of East 14th Street and 150th Avenue in San Leandro, California (Figure 1). Northern and western corners of this intersection were formerly occupied by a Mobil service station and a Phillips service station, and are currently occupied by a commercial building and an automotive repair shop, respectively. An operating Chevron service station is located adjacent to the southern corner of the intersection, approximately 200 feet southwest of the 76 station. Current 76 station facilities include a station building, four dispenser islands, and two underground storage tanks (USTs) located in a common pit in the western corner of the site. A waste oil UST is also present behind the station building. Eleven groundwater monitoring wells are present at and in the immediate site vicinity, and select wells are sampled either on a quarterly or semi-annual basis. Locations of pertinent site features are shown on Figure 2.

Well Survey

Based on a review of data provided from a 0.5 mile well search performed by the Alameda County Public Works Agency (ACPWA), the following sensitive receptors were identified in the site vicinity. There are 25 water wells located within ½ mile of the site. Two of the wells are domestic, and the remaining 23 wells are irrigation wells. The two domestic wells are located approximately 1,500 feet to the south and 2,500 feet to the southeast of the site, respectively. The nearest irrigation well is located approximately 500 feet east of the site (crossgradient). Based on these data, there is a very low probability that impacted groundwater emanating from the 76 facility has traveled the necessary distance to impact the

downgradient domestic wells. (Figures and Tables of Well Search Results reported in GR's *Risk-Based Corrective Action Evaluation*, dated May 20, 2003)

Hydrology

The site is situated on terrain gently sloping to the south/southwest, and the nearest surface waters are Estudillo Canal, located approximately 2,800 feet south, and San Leandro Creek, located approximately 1.4 miles south. Estudillo Creek flows toward the west and is predominantly channeled, while San Leandro Creek flows toward the southwest and ultimately drains into San Francisco Bay. Based on historical groundwater monitoring results, groundwater flow is toward the south/southwest.

Previous Environmental Work

- 1991 - Removal of two gasoline USTs, one waste oil UST and associated product piping.
 - Overexcavation and offsite disposal of 745 cubic yards of hydrocarbon impacted soil.
 - Removal and offsite disposal of 15,700 gallons of groundwater from the UST pit.
- 1991 - Installation of five 2-inch diameter groundwater monitoring wells (MW-1 through MW-5). Initiation of quarterly monitoring and sampling.
- 1992 - Installation of six additional 2-inch diameter groundwater monitoring wells (MW-6 through MW-11).
- 1995 - Oil/Water Separator abandoned inside station building.
- 1998 - Installation of four soil borings (EB-1 through EB-4).
- 2003 - Preparation of a Risk-Based Corrective Action evaluation.

Current Site Conditions

The extent of soil impact at the site is delineated. During removal of gasoline USTs, waste oil UST, and product piping conducted in 1991, confirmation soil samples collected and analyzed by the laboratory indicate that elevated concentrations of Total Petroleum Hydrocarbons as gasoline (TPHg) and benzene remained in the vicinity of the gasoline UST pit and the northernmost dispenser island. The soil borings installed in 1998 were reported as not detected for TPHg, benzene, toluene, ethyl-benzene, and total xylenes (BTEX), and Methyl tertiary-Butyl Ether (MtBE).

Groundwater analytical results from the quarterly sampling event of February 15, 2003, indicate that Monitoring wells MW-1, MW-2, MW-5, and MW-7 through MW-10 (other wells not sampled since 1999) show an overall declining trend in hydrocarbon concentrations (Charts 1 through 8). Although there has been a recent increase in TPHg concentration in several wells, the laboratory reports that the fuel pattern does not match that of gasoline. GR believes that the recent detections of TPHg represent weathered gasoline, and this idea is reinforced by the lack of changes in benzene and MtBE concentrations. Additionally, during the RBCA evaluation, a groundwater sample from MW-5 was analyzed and the results broken down into seven hydrocarbon chain fractions. The results indicated that almost 50% of the detected compounds were composed of carbon chains greater than C10, which are longer than the usual fresh gasoline carbon chains that range from C6 to C10.

Summary

The attached Site Information Summary form contains information pertinent to the site, results of initial site assessment and remediation, impacted groundwater plume trends, summary tables of historical soil and groundwater sample data, boring logs and figures showing the locations of pertinent site features and sample locations. The SIS and attachments are included in Appendix A.

The following conditions have been found at the site:

1. Hydrocarbon source soils were removed in 1991 during UST replacement and subsequent overexcavation of impacted soil.
2. Free product has not been detected in any monitoring well to date.
3. The groundwater beneath the City of San Leandro is not used as a municipal drinking water supply. This precludes the impacted shallow aquifer from affecting human health in the site vicinity.
4. The site has been adequately characterized. Historical groundwater data collected between May 1991 and the present indicate that the hydrocarbon plume is stable and has been predominantly restricted to groundwater beneath the site and immediate vicinity. Concentrations of MtBE and other hydrocarbons in all wells have shown an overall downward trend since August of 2001. In addition, this site has neither stored nor distributed gasoline containing MtBE since January of 2001.
5. The groundwater plume is well defined in all directions including the downgradient flow direction. The site is located in an area where current and former service stations were located on all four corners of the intersection. Residual dissolved hydrocarbons are expected to naturally attenuate with time.
6. The nearest surface water in the downgradient groundwater direction are Estudillo Canal, located approximately 2,800 feet south, and San Leandro Creek, located approximately 1.4 miles south. Estudillo Creek flows toward the west and is predominantly channeled, while San Leandro Creek flows toward the southwest and ultimately drains into San Francisco Bay. Based on historical groundwater monitoring results, groundwater flow has been toward the south/southwest.
7. The closest sensitive receptors are two domestic water wells located approximately 1,500 feet to the south and 2,500 feet to the southeast, respectively. The nearest irrigation well to the site is located approximately 500 feet east of the site (crossgradient).
8. The RBCA evaluation (GR's *Risk-Based Corrective Action Evaluation*, dated May 20, 2003) determined that there are no risks associated with the current or future uses of the building presently at the site, and that there are no risks to the occupants of the residential properties neighboring the site.

Conclusions And Recommendations

GR previously performed and submitted a RBCA evaluation for the assessment and response to petroleum hydrocarbons in the subsurface soil and groundwater beneath the subject site. A Tier 2 evaluation was performed utilizing available site specific data. The results of the analyses confirm that current site conditions do not exceed the calculated Tier 2 SSTLs specific to the site. Since a service station is presently operating at the site, it is expected that the commercial use will continue in the future. It is GR's understanding that as of January 1, 2001, ConocoPhillips no longer distributes fuel containing MtBE to service stations in northern California. Additionally, it is anticipated that residual dissolved concentrations of weathered petroleum hydrocarbons will continue to attenuate over time, thereby also lowering the associated risk over time. The Tier 2 evaluation verified that there are no risks associated with the current or future uses of the building presently at the site, and that there are no risks to the occupants of the residential properties neighboring the site.

According to the RBCA decision making process, further work would not be warranted to protect against human exposures. The Tier 2 evaluation determined that no additional investigation or remediation is required at the site. Based on the RBCA program findings presented previously, and that the groundwater beneath and in the vicinity of the site is not used for drinking water purposes, it is GR's opinion that the site should be considered for case closure. Once the ACHCS concurs with this request for case closure, GR will recommend that select monitoring wells be properly destroyed, and that remaining wells be utilized for post-closure groundwater quality monitoring.

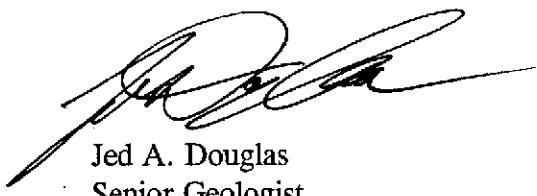

Request for Case Closure -ConocoPhillips (76) Service Station No. 3292, San Leandro, California
May 23, 2003

If you have any questions or comments regarding this request, please feel free to call us at

APPENDIX A

SITE INFORMATION SUMMARY

SITE INFORMATION SUMMARY

I. SITE INFORMATION

Site Facility Name:	ConocoPhillips Service Station No. 3292			
Site Facility Address:	15008 East 14th Street San Leandro, California			
RWQCB LUST Case No.:	URF Filing Date: unknown			
Responsible Parties (include address and phone numbers)		ConocoPhillips		
David Dewitt 916-558-7666				
76 Broadway				
Sacramento, CA 95818				
Tank No.	Size in Gallons	Contents	Closed In -- Place/Removed?	Date
1	10,000	gasoline	removed	January-91
2	10,000	gasoline	removed	January-91
3	280	waste oil	removed	January-91
4	12,000 - double wall	gasoline	currently in use	May-03
5	12,000 - double wall	gasoline	currently in use	May-03
6	250	waste oil	currently in use	May-03

II. INITIAL SITE ASSESSMENT (Information from previous investigations at nearby sites and other available sources may be used for applicable items if necessary)

Cause and Estimated Quantity of Release: holes in UST observed during tank replacement, unknown quantity released			
Nearest Surface Water Bodies (including any unnamed creeks, tributaries, canals, etc.): Estudillo Creek San Leandro Creek		Their Geographical Distances From the Site: 2,800 feet south 1.4 miles south	
Nearest Domestic Water Wells (both public and private) within 2,000 feet: domestic water well domestic water well		Their Geographical Distances From the Site: 1,500 feet south 2,500 feet southeast	
Minimum Groundwater Depth:	6.08	Max. Depth:	14.72
Flow Direction: S/SW			
Site Ground Surface Elevation and Geology: The site is located at an elevation of approximately 35 feet above MSL. The site vicinity has been reported as composed of Pleistocene alluvium, consisting of clay, silt, sand, and gravel. The site is underlain by silt and clay with minor interbedding of silty to clayey sand, to at least 21.5 feet below ground surface.			
Current Site and Surrounding land Use: The site is currently an active 76 gasoline service station. The site vicinity is used for commercial and residential purposes, including service stations, automotive repair, retail and residential.			
Preferential Pathways Such as Subsurface Utilities? No If Yes, Describe Based on the average depth to water of approximately 10 feet, it is unlikely that subsurface utilities are acting as preferential pathways.			
Number of Soil Borings:	15	Number of Monitoring Wells:	11

Table 1
Groundwater Monitoring Data and Analytical Results
 Tosco (Unocal) Service Station #3292
 15008 East 14th Street
 San Leandro, California

EXPLANATIONS:

Groundwater monitoring data and laboratory analytical results prior to February 12, 1998, were compiled from reports prepared by MPDS Services, Inc.

TOC = Top of Casing

(ft.) = Feet

DTW = Depth to Water

S.I. = Screen Interval

(ft.bgs) = Feet Below Ground Surface

GWE = Groundwater Elevation

(msl) = Mean sea level

TPH-G = Total Petroleum Hydrocarbons as Gasoline

B = Benzene

T = Toluene

E = Ethylbenzene

X = Xylenes

MTBE = Methyl tertiary butyl ether

(ppb) = Parts per billion

ND = Not Detected

-- = Not Measured/Not Analyzed

(SP) = Shadrill Property wells

QA = Quality Assurance/Trip Blank

* TOC elevations are relative to msl, per a Benchmark located at the northwest corner of East 14th Street and 150th Avenue, (Elevation = 36.88 feet, msl).

TOC elevations for MW-2 (SP) and MW-3 (SP) are relative to msl, per Chevron monitoring well MW-6 used as a benchmark, (Elevation = 36.92 feet, msl).

East 14th Street and 150th Avenue, (Benchmark Elevation = 36.883 feet, msl). Prior to September 24, 1993, DTW measurements were taken from the top of the well covers.

¹ Laboratory report indicates the hydrocarbons detected appeared to be a gasoline and non-gasoline mixture.

² Laboratory report indicates the hydrocarbons detected did not appear to be gasoline.

³ The analytical results of the groundwater were inconsistent with the previous analytical results for this well. The laboratory re-analyzed the sample past hold time; therefore the results may be biased low.

⁴ The monitoring well was re-sampled on November 20, 1995. The vial containing the water sample collected from this well on November 2, 1995, was inadvertently broken by the laboratory.

⁵ All EPA Method 8010 constituents were ND.

⁶ The monitoring wells MW-8 and MW-11 were re-sampled on February 14, 1996. The vials containing the water samples collected from the wells on February 8, 1996, were inadvertently broken by the laboratory.

⁷ Detection limit raised. Refer to analytical reports.

⁸ Laboratory report indicates gasoline and unidentified hydrocarbons <C7.

⁹ Laboratory report indicates gasoline and discrete peaks C6-C12.

¹⁰ Laboratory report indicates gasoline and unidentified hydrocarbons C6-C8.

¹¹ Laboratory report indicates weathered gasoline C6-C12.

¹² MTBE by EPA Method 8260.

¹³ Laboratory report indicates unidentified hydrocarbons >C8.

¹⁴ Laboratory report indicates unidentified hydrocarbons >C6.

¹⁵ Laboratory report indicates weathered gas and unidentified hydrocarbons >C6.

¹⁶ Laboratory report indicates gasoline and unidentified hydrocarbons <C6.

¹⁷ Laboratory report indicates gasoline C6-C12.

Table 1
Groundwater Monitoring Data and Analytical Results
Tosco (Unocal) Service Station #3292
15008 East 14th Street
San Leandro, California

EXPLANATIONS: (cont)

- ¹⁸ MTBE by EPA Method 8260 analyzed past EPA recommended holding time.
- ¹⁹ Laboratory report indicates unidentified hydrocarbons C6-C12.
- ²⁰ MTBE by EPA Method 8260 analyzed one day past the EPA recommended holding time; sample was inadvertently chosen for MTBE confirmation instead of MW-11.
- ²¹ TPH-G, BTEX and MTBE by EPA Method 8260.
- ²² Laboratory report indicates hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
- ²³ Laboratory report indicates BTEX compounds were found in the QA sample at levels significantly greater than the reporting limits. Because many of the samples themselves were clean for these compounds, it is not likely that this contamination was introduced during transportation.

EXPLANATION:

TPHg = Total Petroleum Hydrocarbons as gasoline

MTBE = Methyl t-Butyl Ether

ppm = Parts per million

gm/cc = grams per cubic centimeter

--- = Not analyzed/not applicable

ANALYTICAL METHODS:

TPHg = EPA Method 8015Mod
Benzene, toluene, ethylbenzene, xylenes, MTBE = EPA Method 8020

Porosity = API RP-40

Density = D-2937

Moisture content = D-2216

Organic Content = Walkley-Black

ANALYTICAL LABORATORY:

Sequoia Analytical (ELAP #1210)

GEOTECHNICAL LABORATORY:

PTS Laboratories
