San Leandro, California

Dear Ms. Garcia-La Grille:

Attached for your review and comment is a copy of the *Soil and Water Investigation Report* for the above referenced site. Upon information and belief, I declare, under penalty of perjury, that the information contained in the attached document is true and correct.

As always, please feel free to contact me directly at (559) 645-9306 with any questions or concerns.

Sincerely,

Shell Oil Products US

Karen Petryna

Re: **Soil and Water Investigation Report**

Shell-branded Service Station
1784 150th Avenue
San Leandro, California
Incident #: 98996068
Project #: 246-0612-008

Dear Ms. Garcia-La Grille:

Cambria Environmental Technology, Inc. (Cambria) is submitting this *Soil and Water Investigation Report* on behalf of Equilon Enterprises LLC dba Shell Oil Products US (Shell). The current investigation and monitoring well installation was conducted in accordance with our August 28, 2003 *Soil and Water Investigation Report and Work Plan*, which Ms. eva chu of the Alameda County Health Care Services Agency (ACHCSA) approved in a letter dated September 17, 2003. The investigation's objectives were to install additional wells both on and off-site with specifically defined well screen intervals based on the previous investigation results, and to define the upgradient extent of the methyl tertiary butyl ether (MTBE) and hydrocarbon plumes off site to the east with two additional soil borings. The two additional borings were delayed due to difficulty obtaining an off-site access agreement. This report presents the results of the two additional soil borings proposed. The investigation results and conclusions addressing the on-site and off-site well installations and hydrocarbon plume definition were previously submitted to the ACHCSA in Cambria's January 12, 2004 *Soil and Water Investigation and Monitoring Well Installation Report*. Presented below are summaries of the site background, investigation procedures, investigation results, conclusions, and recommendations.

SITE BACKGROUND

**Cambria
Environmental
Technology, Inc.**

Site Location: The site is an operating Shell service station located at the southern corner of 150th Street and Freedom Avenue in San Leandro, California (Figure 1).

5900 Hollis Street
Suite A
Emeryville, CA 94608
Tel (510) 420-0700
Fax (510) 420-9170

Local Topography: The base of the San Leandro hills is approximately 0.25 miles to the northeast. The site is about 50 feet above mean sea level, and the local topography slopes westward toward the San Francisco Bay, approximately 6 miles to the west.

Surroundings: The site is surrounded by mixed commercial and residential development.

Local Geology: Sediments beneath the site are Quaternary alluvial deposits derived from sedimentary and igneous rocks of the Diablo Range. The site is intersected by the Hayward Fault Zone. The site is underlain by low estimated permeability sediments (clay) with interspersed moderate estimated permeability sediments. During the recent investigation at the site, soil consisted of silty clay, clayey silts and clayey sandy silt interlayered with sands and gravels to the total explored depth of 36 feet below grade (fbg).

Groundwater: Local drinking water is supplied by a utility, not groundwater. An area well survey in 1992 identified 21 wells within ½ mile of the site (Figure 1). The well survey was updated in October 2003 as described below. Groundwater depths have ranged between 17 and 30 fbg on site and between approximately 4 and 14 fbg in off-site well MW-4. Water level measurements have not shown a consistent or reliable groundwater flow direction, although the predominant groundwater flow direction since 1999 has been to the north-northwest. In June 2003, depth to groundwater measurements ranged from approximately 13 to 24 fbg, and the groundwater flow direction was to the northwest.

Previous Investigations

1986 Waste Oil Tank Removal: According to an October 13, 1989 letter from Weiss Associates (Weiss) to Shell, Petroleum Engineering of Santa Rosa, California removed a 550-gallon waste oil tank from the site in November 1986. Immediately following the tank removal, Blaine Tech Services (Blaine) of San Jose, California collected soil samples beneath the former tank at 8-foot and 11-foot depths. The soil samples contained petroleum oil and grease at 196 and 167 parts per million (ppm), respectively. The tank pit was overexcavated to a total depth of 16 feet, but soil samples were not collected. Groundwater was not encountered in the tank excavation. A new 550-gallon fiberglass waste oil tank was installed in the same location.

1990 Well Installation: In March 1990, Weiss installed soil boring BH-A, which was converted to groundwater monitoring well MW-1 adjacent to the waste oil tank. In a soil sample collected from 29 fbg, 35 ppm total petroleum hydrocarbons as gasoline (TPHg) and 0.23 ppm benzene were detected.

1992 Well Installations: In February 1992, Weiss installed soil borings BH-B and BH-C, which were converted to monitoring wells MW-2 and MW-3. A soil sample collected near the water

table from the boring for well MW-2 contained 79 ppm TPHg. Although well MW-3 is located over 100 feet upgradient of the tanks, up to 68 ppm TPHg was detected in soil from this boring.

1994 Subsurface Investigation: In June 1994, Weiss drilled six soil borings (B-1 through B-6) around the site. No hydrocarbons were detected in soil samples from any borings, except for 0.013 ppm benzene in boring BH-3 at 16 fbg. Also, no hydrocarbons were detected in grab groundwater samples from borings BH-1, BH-4, BH-5 and BH-6. Groundwater from borings BH-2 and BH-3 contained over 5,000 parts per billion (ppb) TPHg.

1995 Well Installation: In February and March 1995, Weiss drilled four soil borings (BH-7 through BH-10) and converted BH-10 to monitoring well MW-4. No petroleum hydrocarbons were detected in any of the soil samples. Up to 100 ppb TPHg and 1.0 ppb benzene were detected in grab groundwater samples from BH-7 and BH-9. No TPHg or benzene was detected in the grab groundwater sample from MW-4. Groundwater was not encountered in soil boring BH-8.

1996 Soil Vapor Survey and Soil Sampling: In July 1996, Weiss conducted a subsurface investigation to obtain site-specific data for a risk-based corrective action (RBCA) evaluation of the site. Soil vapor and soil samples were collected from the vadose zone at 10 on- and off-site locations (SVS-1 through SVS-10). The highest soil vapor hydrocarbon concentrations were detected near the northwest corner of the underground storage tank complex (SVS-5 at 3.0 fbg, which contained 7,600 parts per billion by volume [ppmv] benzene). No TPHg, benzene, toluene, ethylbenzene, and xylenes (BTEX), or MTBE was detected in any of the soil samples except for 1.1 ppm TPHg detected in sample SVS-5 at 18 to 20 fbg. Weiss concluded that depleted oxygen concentrations and elevated carbon dioxide and methane concentrations in the vadose zone indicated that biodegradation was occurring.

1997 RBCA Evaluation: In 1997, Weiss prepared a RBCA evaluation for the site. Results of the RBCA analysis indicated that concentrations of BTEX, MTBE, 1,2-dichloroethane, and tetrachloroethane detected in soil and groundwater beneath the site did not exceed a target risk level of 10^{-5} for residential indoor or outdoor air exposure pathways. However, a risk threshold exceedance was identified associated with ingestion of groundwater from a hypothetical well 25 feet downgradient of the source.

1997 Dispenser and Turbine Sump Upgrade: The dispensers and turbine sums at the station were upgraded in December 1997. Cambria collected soil samples Disp-A through Disp-D from beneath the dispenser islands during upgrade activities. Up to 590 ppm TPHg (Disp-C at 4.5 fbg), 1.8 ppm benzene (Disp-C at 2.0 fbg) and 1.4 ppm MTBE (Disp-C at 2.0 fbg) were detected.

August 2003 Soil and Groundwater Investigation: Seven soil borings (SB-10, SB-11, SB-12, SB-13, SB-14, SB-15, and SB-16) were all installed off site to the northwest of the site in both 150th Avenue and Portofino Circle, with the exception of SB-15 which was on site (Figure 2). During the investigation, MTBE was detected only in on-site grab groundwater sample SB-15-W at 40 ppb. The highest TPHg concentration was detected in SB-14-W at 67,000 ppb, and the highest benzene concentration was detected in SB-15-W at 530 ppb. TPHg was detected only in soil samples SB-11-30' and SB-15-36' at concentrations of 650 ppm and 1.4 ppm, respectively. Benzene was detected only in soil sample SB-11-35' at 0.10 ppm. Based on typical groundwater depths in nearby well MW-7, it was determined that samples SB-11-30' and SB-15-36' were saturated, and results may be more indicative of chemical concentrations in groundwater.

October 2003 Sensitive Receptor Survey (SRS): In October 2003, Cambria completed an SRS at Shell's request. The SRS targeted the following as potential sensitive receptors: basements within 200 feet, surface water and sensitive habitats within 500 feet, hospitals, residential care and childcare facilities within 1,000 feet, and water wells within ½ mile. No basements were observed within 200 feet, nor were any surface water or sensitive habitats observed within 500 feet. No educational or childcare facilities were identified within the search radius. The Fairmont Hospital campus, located at 15400 Foothill Boulevard, is located approximately 1,100 feet from the site, just outside the target radius.

To update the 1992 well survey performed by Weiss, Cambria researched Department of Water Resources records in September 2003, and located no additional well records for locations within ½ mile of the site. The closest identified water well potentially used for drinking water is a well installed in 1952, listed as a "domestic well," located at Fairmont Hospital, approximately 2,445 feet east-southeast of the site, as shown on Figure 1. The well is reportedly 138 feet deep, and has screened intervals between 62 and 95 fbg. The well's status and operation frequency are unknown. Due to the well's distant location from the site and the site's observed groundwater flow directions, it is unlikely that this well could be impacted by groundwater from the site.

November 2003 Monitoring Well Installation: On November 19 and 20, 2003, Cambria completed the installation of on-site and off-site wells MW-9, MW-10, and MW-11. Off-site soil borings were not completed due access agreement issues. MTBE was detected in two soil samples (MW-11-20' and MW-11-24.5') at concentrations of 0.039 and 1.4 ppm, respectively. TPHg was detected in four soil samples (MW-10-30', MW-10-31.5', MW-11-20', and MW-11-34.5') at concentrations of 14, 230, 1.8, and 330 ppm, respectively. All soil samples with detectable hydrocarbon concentrations were saturated soil samples, so identified results appeared more indicative of chemical concentrations in groundwater than sorbed to soil. The off-site soil borings previously installed in conjunction with the new monitoring wells adequately defined the hydrocarbon plume in all directions except to the southeast.

Groundwater Monitoring: Groundwater has been sampled quarterly since March 1990. Groundwater samples from MW-2 have contained the highest TPHg and benzene concentrations, up to 160,000 ppb and 36,000 ppb, respectively. Although hydrocarbons have been detected in water from wells MW-1 and MW-3, no hydrocarbons have been detected in water from downgradient well MW-4 except in second quarter of 2003, and laboratory notes indicate that the detected hydrocarbons did not match the laboratory standard. Wells MW-7 and MW-8 have contained up to 49,000 ppb TPHg and 830 ppb benzene, but MTBE has not been detected in these wells.

INVESTIGATION PROCEDURES

Cambria supervised the installation of two off-site soil borings (SB-17 and SB-18) (Figure 2). As Cambria recommended in our August 28, 2003 *Soil and Water Investigation Report and Work Plan* and as ACHCSA requested in a September 17, 2003 approval letter, the off-site soil borings were installed, south to southeast of the site (Figure 2). Gregg Drilling Inc. (Gregg) of Martinez, California installed the soil borings using a Geoprobe® direct-push drill rig. Cambria's Standard Field Procedures for Soil Borings and Grouting are included as Attachment A.

Permits: Cambria obtained a soil boring installation permit from the Alameda County Public Works Agency for both soil borings (Permit #W04-0637). A permit copy is included as Attachment B.

Soil Sampling Dates: September 13, 2004

Drilling Company: Gregg (C-57 License #485165).

Personnel Present: Stewart Dalie, Staff Scientist, Cambria
Don Parsons, Driller, Gregg

Drilling Method: Gregg drilling used a Geoprobe® direct-push drill rig for the off-site soil borings.

Number of Borings: Two: SB-17 and SB-18.

Boring Depths: Soil boring SB-17 was advanced to a total depth of 36 fbg, and soil boring SB-18 was advanced to a total depth of 32 fbg. (Attachment C).

Soil Sampling Method:

Soil was collected directly from the subsurface in 4-foot acetate liners. Cambria field staff selected the sample locations at approximate 5-foot intervals, and retained the samples by cutting 6-inch sections of liner with the soil contained inside. Teflon tape was then used to cap the ends of the tube to diminish any headspace, and plastic end caps were used to seal the integrity of the sample. Samples were then retained in an ice filled cooler under chain-of-custody seal.

Sediment Lithology:

Asphalt and baserock comprised the top 2.5 feet in each location. Soil encountered during drilling consisted of clay from approximately 2.5 to 3 fbg to 13 to 15 fbg, underlain by silty sands and sandy silts and silty clay with gravel and sand to the total explored depth of between 32 and 36 fbg, respectively (Attachment C). Both borings were back filled with Portland neat cement Type I/II via tremie pipe, and the surface conditions were restored to match the existing grade with asphalt.

Grab Groundwater Sampling:

Upon completion of each location to total depth, Cambria field staff instructed Gregg field staff to insert 1-inch PVC casing into the boring with 10-feet of 0.010-inch screen on the bottom. The temporary piezometers were set, and a stainless steel bailer was used with string to collect water to fill several VOA containers from each location. Samples were then retained in an ice-filled cooler under chain-of-custody seal. The casing was removed and used as tremie pipe for back filling the soil boring locations.

Groundwater Depths:

Groundwater was first encountered during drilling activities at approximately 32 fbg in SB-18 and at 34 fbg in SB-17. One hour later, static groundwater in SB-18 and SB-17 was measured at 27.6 and 28.5 fbg, respectively. The depth to groundwater was measured soon after initial intrusion into the aquifer, so hydrostatic pressures may not have had adequate time to equilibrate. Therefore, static groundwater readings measured on September 13, 2004 may not be representative of true static water conditions in those locations.

Chemical Analyses:

Selected soil and grab groundwater samples collected from the soil boring locations were analyzed by State-certified laboratory Severn Trent Laboratories Inc. of Pleasanton, California (STL)

for TPHg, BTEX, MTBE, tert-butyl alcohol (TBA), ethyl tert butyl ether, di-isopropyl ether, ethanol, 1,2-dichloroethane, and ethylene dibromide using EPA Method 8260B (Attachment D). To characterize the soil cuttings for disposal, four brass tubes of soil were collected. STL analyzed the samples for TPHg, total petroleum hydrocarbons as diesel, and BTEX by EPA method 8260B and for total threshold limit concentration lead by EPA method 6010B.

***Stockpile Soil Sampling
And Disposal:***

Soil cuttings produced from the borings were wrapped in plastic sheeting, labeled and temporarily stockpiled on site. The cuttings will be transported by Manley and Sons Trucking Company of Sacramento, California to Forward Landfill in Manteca, California for disposal.

INVESTIGATION RESULTS

Chemical Distribution in Soil: No target analytes were detected in any soil sample collected during the investigation. The certified analytical laboratory reports are included as Attachment D, and the results are summarized as Table 1.

Chemical Distribution in Groundwater: No benzene, MTBE, TBA, fuel oxygenates, or lead scavengers were detected in grab groundwater samples collected during the investigation. TPHg was detected at 55 ppb in grab groundwater sample SB-18-W. Toluene, ethylbenzene and xylenes were detected in grab groundwater samples SB-17-W and SB-18-W at concentrations of 4.2 and 5.5 ppb toluene, respectively; 2.0 and 2.5 ppb ethylbenzene, respectively; and 7.9 and 10 ppb xylenes, respectively. The certified analytical laboratory reports for this investigation are included as Attachment D, and the results are summarized as Table 2.

CONCLUSIONS AND RECOMMENDATIONS

Soil lithology observed during this investigation was consistent with previously determined saturated intervals and depth-to-water readings. The soil analytical results indicate no soil impacts to the southeast of the site. The groundwater analytical results indicate low hydrocarbon concentrations are present. The detected groundwater concentrations are below California

C A M B R I A

Ms. Roseanna E. Garcia-La Grille
December 17, 2004

maximum contaminant levels (MCLs), and thus, below levels of concern. The off-site soil borings installed during this investigation complete definition of the extent of the hydrocarbons in soil and groundwater in all directions.

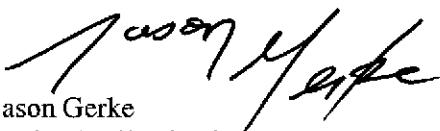

Cambria recommends continued ongoing monitoring at the site.

CLOSING

Please call Jason Gerke at (510) 420-3320, if you have any questions or comments.

Sincerely,
Cambria Environmental Technology, Inc.

Table 1. Soil Analytical Results - Shell-branded Service Station, 1784 150th St., San Leandro, California - Incident #98996068

Sample ID	Date	Depth	TPHg	Benzene	Toluene	Ethyl-benzene	Xylenes	MTBE (8020)	MTBE (8260)	TBA	ETBE	DIPE	TAME	1,2-DCA	EDB	Ethanol	
(fbg)																(Concentrations in mg/kg)	

Abbreviations:

TPHg = Total petroleum hydrocarbons as gasoline. From 1990 through 1998, analyzed by modified EPA Method 8015; from 2001 through 2004, analyzed by EPA Method 8260B.

Benzene, toluene, ethylbenzene, and total xylenes analyzed by EPA Method 8020 from 1990 through 1998; from 2001 through 2004, analyzed by EPA Method 8260B.

MTBE = Methyl tert-butyl ether analyzed by EPA Method 8020 or EPA Method 8260 (as indicated).

TBA = Tert-Butyl alcohol, analyzed by EPA Method 8260B.

ETBE = Ethyl tert butyl ether, analyzed by EPA Method 8260B.

DIPE = Di-isopropyl Ether, analyzed by EPA Method 8260B.

TAME = tert-Amyl methyl ether, analyzed by EPA Method 8260B.

1,2-DCA = 1,2-dichloroethane

EDB = Ethyl di-bromide, analyzed by EPA Method 8260B.

Ethanol analyzed by EPA Method 8260B.

fbg = Feet below grade

mg/kg = Milligrams per kilogram

<n = Below detection limit of n mg/kg

--- = Not analyzed

Notes:

a = Petroleum oil and grease analyzed by American Public Health Association Standard Method 503E; no detections above 100 ppm detection limit. Total oil and grease analyzed by American Public Health Association Standard Method 503E; no detections above 50 ppm detection limit.

b = Analyzed for halogenated volatile organic compounds by EPA Method 8010; none detected.

c = Total petroleum hydrocarbons as diesel (TPHd) and total petroleum hydrocarbons as motor oil (TPHmo) analyzed by modified EPA Method 8015; no TPHd detected at 1 ppm limit; no TPHmo detected at 10 ppm limit.

e = TPHd detected at 23 ppm by modified EPA Method 8015; lab characterized detected compounds as hydrocarbons lighter than diesel.

f = TPHd detected at 4.9 ppm by modified EPA Method 8015; lab characterized detected compounds as hydrocarbons lighter than diesel.

g = Analyzed for volatile organic compounds by EPA Method 8010; none detected above detection limits ranging from 0.005 to 0.050 ppm.

h = Sample saturated with perched water from beneath dispenser.

Standard Filed Procedures for Soil Borings and Grouting

CAMBRIA

STANDARD FIELD PROCEDURES FOR SOIL BORINGS AND GROUTING

This document describes Cambria Environmental Technology's standard field methods for drilling and sampling soil borings. These procedures are designed to comply with Federal, State and local regulatory guidelines. Specific field procedures are summarized below.

Objectives

Soil samples are collected to characterize subsurface lithology, assess whether the soils exhibit obvious hydrocarbon or other compound vapor odor or staining, estimate ground water depth and quality and to submit samples for chemical analysis.

Soil Classification/Logging

All soil samples are classified according to the Unified Soil Classification System by a trained geologist or engineer working under the supervision of a California Registered Geologist (RG) or a Certified Engineering Geologist (CEG). The following soil properties are noted for each soil sample:

- Principal and secondary grain size category (i.e. sand, silt, clay or gravel)
- Approximate percentage of each grain size category,
- Color,
- Approximate water or liquid saturation percentage,
- Observed odor and/or discoloration,
- Other significant observations (i.e. cementation, presence of marker horizons, mineralogy), and
- Estimated permeability.

Soil Boring and Sampling

Soil borings are typically drilled using hollow-stem augers or hydraulic push technologies. At least one and one half ft of the soil column is collected for every five ft of drilled depth. Additional soil samples are collected near the water table and at lithologic changes. Samples are collected using lined split-barrel or equivalent samplers driven into undisturbed sediments beyond the bottom of the borehole. The vertical location of each soil sample is determined by measuring the distance from the middle of the soil sample tube to the end of the drive rod used to advance the split barrel sampler. All sample depths use the ground surface immediately adjacent to the boring as a datum. The horizontal location of each boring is measured in the field from an onsite permanent reference using a measuring wheel or tape measure.

Drilling and sampling equipment is steam-cleaned prior to drilling and between borings to prevent cross-contamination. Sampling equipment is washed between samples with trisodium phosphate or an equivalent EPA-approved detergent.

Sample Storage, Handling and Transport

Sampling tubes chosen for analysis are trimmed of excess soil and capped with Teflon tape and plastic end caps. Soil samples are labeled and stored at or below 4°C on either crushed or dry ice, depending upon local regulations. Samples are transported under chain-of-custody to a State-certified analytic laboratory.

CAMBRIA

Field Screening

One of the remaining tubes is partially emptied leaving about one-third of the soil in the tube. The tube is capped with plastic end caps and set aside to allow hydrocarbons to volatilize from the soil. After ten to fifteen minutes, a portable photoionization detector (PID) measures volatile hydrocarbon vapor concentrations in the tube headspace, extracting the vapor through a slit in the cap. PID measurements are used along with the field observations, odors, stratigraphy and ground water depth to select soil samples for analysis.

Water Sampling

Water samples, if they are collected from the boring, are either collected using a driven Hydropunch type sampler or are collected from the open borehole using bailers. The ground water samples are decanted into the appropriate containers supplied by the analytic laboratory. Samples are labeled, placed in protective foam sleeves, stored on crushed ice at or below 4°C, and transported under chain-of-custody to the laboratory.

Duplicates and Blanks

Blind duplicate water samples are collected usually collected only for monitoring well sampling programs, at a rate of one blind sample for every 10 wells sampled. Laboratory-supplied trip blanks accompany samples collected for all sampling programs to check for cross-contamination caused by sample handling and transport. These trip blanks are analyzed if the internal laboratory QA/QC blanks contain the suspected field contaminants. An equipment blank may also be analyzed if non-dedicated sampling equipment is used.

Grouting

If the borings are not completed as wells, the borings are filled to the ground surface with cement grout poured or pumped through a tremie pipe.

Waste Handling and Disposal

Soil cuttings from drilling activities are usually stockpiled onsite on top of and covered by plastic sheeting. At least four individual soil samples are collected from the stockpiles for later compositing at the analytic laboratory. The composite sample is analyzed for the same constituents analyzed in the borehole samples. Soil cuttings are transported by licensed waste haulers and disposed in secure, licensed facilities based on the composite analytic results.

Ground water removed during sampling and/or rinsate generated during decontamination procedures are stored onsite in sealed 55 gallon drums. Each drum is labeled with the drum number, date of generation, suspected contents, generator identification and consultant contact. Disposal of the water is based on the analytic results for the well samples. The water is either pumped out using a vacuum truck for transport to a licensed waste treatment/disposal facility or the individual drums are picked up and transported to the waste facility where the drum contents are removed and appropriately disposed.

STARTING DATE 6/18/04

COMPLETION DATE 6/18/04

I hereby agree to comply with all requirements of this permit and Alameda County Ordinance No. 73-68.

APPLICANT'S SIGNATURE Gregg Driller

1. FAX PRINT NAME Steeler A. Driller III

Rev. 9-18-02

FOR OFFICE USE
PERMIT NUMBER W04-0637
WELL NUMBER _____
APN _____

PERMIT CONDITIONS

Circled Permit Requirements Apply

A. GENERAL

1. A permit application should be submitted so as to arrive at the ACPWA office five days prior to proposed starting date.
2. Submit to ACPWA within 60 days after completion of permitted original Department of Water Resources' Well Completion Report.
3. Permit is void if project not begun within 90 days of approval date.

B. WATER SUPPLY WELLS

1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
2. Minimum seal depth is 50 feet for municipal and industrial wells or 20 feet for domestic and irrigation wells unless a lesser depth is specially approved.

C. GROUNDWATER MONITORING WELLS

INCLUDING PIEZOMETERS

1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
2. Minimum seal depth for monitoring wells is the maximum depth practicable or 20 feet.

D. GEOTECHNICAL 100 ft. in length

Backfill bore hole by tremie with cement grout or cement grout/sand mixture. Upper two-three foot replaced in kind or with compacted earth.

E. CATHODIC

Fill hole anode zone with concrete placed by tremie.

F. WELL DESTRUCTION

Send a map of work site. A separate permit is required for wells deeper than 45 feet.

G. SPECIAL CONDITIONS

B#1
NOTE: One application must be submitted for each well or well destruction. Multiple borings on one application are acceptable for geotechnical and contamination investigations.

APPROVED [Signature]

Dear Mr. Dalie:

Attached is our report for your samples received on 09/15/2004 08:05

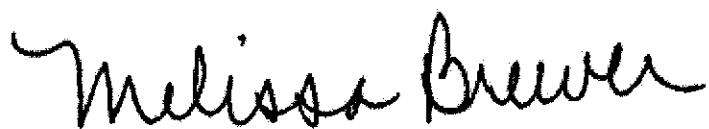

This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

Please note that any unused portion of the samples will be discarded after 10/30/2004 unless you have requested otherwise.

We appreciate the opportunity to be of service to you. If you have any questions,

You can also contact me via email. My email address is: mbrewer@stl-inc.com

Sincerely,

Melissa Brewer
Project Manager

RESIDUAL MANAGEMENT PROCEDURE

ISSUED DATE: 08/01/01
CANCELS ISSUE:
ISSUED BY: LRR

RESIDUAL STREAM: SOIL WITH UNLEADED GASOLINE + DIESEL
VENDOR: ALLIED-BFI
LOCATION: ALLIED WASTE - MANTeca
6999 SOUTH AUSTIN ROAD
MANTeca, CA 95336

CALIFORNIA - TRANSPORTATION AND RETAIL

BTEX - EPA 8021B/8260B (IF BENZENE IS > OR = TO 10 MG/KG THEN TCLP BENZENE IS REQUIRED)

CAM METALS = TTLC METALS - Lead only

STLC ON ALL TTLC METALS 10 TIMES STLC MAXIMUM

TTLC LEAD -> 13 MG/KG REQUIRES ORGANIC LEAD ANALYSIS

IF ANY TTLC TOTAL METAL IS > OR = TO 20 TIMES TCLP REGULATORY LEVELS, TCLP IS REQUIRED

TOTAL PETROLEUM HYDROCARBONS, METHOD 418.1 OR 8015

GASOLINE AND DIESEL

MTBE METHOD 8260B (GC/MS)

AQUATIC BIOASSAY (FISH TOX) IS ONLY TO BE RUN ON SAMPLES > OR = TO 5000 PPM TPH. AQUATIC BIOASSAY (FISH TOX) = PART 800 OF STANDARD METHODS FOR THE EXAMINATION OF WATER AND WASTEWATER (15TH EDITION)

LABORATORY INSTRUCTIONS (MINIMUM GUIDELINES ONLY)

-ALTERNATE APPROVED TEST METHODS PER SW846 ARE ALSO ACCEPTABLE

-ALL REQUIRED TESTS ON COMPOSITE (MAX 4:1)

-LABORATORY IS TO SUPPLY QA/QC INFORMATION WITH ALL ANALYTICAL REPORTS

~~-MAIL OR FAX ALL ANALYSIS TO THE CENTRALIZED RESIDUAL MANAGEMENT TEAM~~

PROCEDURE ORIGINAL DATE: 08/01/01

PROCEDURE REVISED DATE: 09/01/01
