Alameda, CA 94502

FEB 14 2002

Dear Ms. chu:

Subject: Quarterly Groundwater Monitoring Report,
AC Transit, 1177 47th Street, Emeryville

AC Transit hereby submits the enclosed quarterly groundwater monitoring report for the AC Transit facility located at 1177 47th Street in Emeryville. The report was prepared by our consultant, Cameron-Cole, LLC, and contains the results of the December 2001 sampling event.

Ground water samples were collected from three on-site monitoring wells and analyzed for total extractable petroleum hydrocarbons (TPH) using modified EPA Method 8015 and benzene, toluene, ethylbenzene, and xylenes (BTEX), and methyl tert-butyl ether (MTBE) using EPA Method 8021B. This sampling was performed pursuant to your August 7, 2001, request of quarterly groundwater sampling of monitoring wells MW-11, MW-12, and MW-13 and semi-annual groundwater sampling of other site monitoring wells. Depth to ground water was measured in all 16 monitoring wells and ground water contour maps were developed for the report.

Analytical results indicate that TPH was detected as degraded diesel in MW-11, MW-12, and MW-13 at concentrations of 320, 170 and 160 ppb, respectively. BTEX compounds were not detected in any of the samples. TPH as degraded gasoline was detected only in MW-12 at a concentration of 670 ppb. MTBE was measured at 9.4 ppb in the sample from MW-12.

If you have any questions regarding this report or other matters pertaining to this site, please call me at (510) 577-8869.

Sincerely,

Suzanne Patton, P.E.
Environmental Engineer

INTRODUCTION

This report presents the results from the December 2001 sampling event for the AC Transit Facility located at 1177 47th Street, Emeryville, California (Site). Groundwater sampling of monitor wells MW-11, MW-12 and MW-13 was conducted in accordance with directives from Alameda County Health Care Services (ACHCS). In a letter dated August 7, 2001, ACHCS requested quarterly groundwater sampling for monitor wells MW-11, MW-12 and MW-13 and semi-annual groundwater sampling of other Site monitor wells. AC Transit retained Cameron-Cole to perform this work.

GROUNDWATER MONITORING

Work performed during this sampling event included measuring depth to water in all monitor wells and groundwater sampling of monitor wells MW-11, MW-12 and MW-13. Groundwater samples were analyzed for total extractable petroleum hydrocarbons (TEPH) using Environmental Protection Agency (EPA) Method 8015 Modified and benzene, toluene, ethylbenzene, xylenes (BTEX), and methyl tertiary-butyl ether (MTBE) by EPA Method 8021B.

A site map displaying the monitor well locations is presented as Figure 1. Chain-of-custody documents, field data sheets and certified analytical reports are included in Appendix A.

Groundwater Elevations and Flow Direction

On December 14, 2001, all 16 Site monitor wells were inspected and measured for the presence of free phase hydrocarbons and depth to groundwater. Measurements of depths to groundwater are presented on Table 1 and were used to construct the groundwater elevation contours shown in Figure 2. As shown on Figure 2, groundwater flow is to the west at a gradient of 0.02 feet/foot.

Groundwater Sampling Activities

The monitor wells were purged a minimum of three casing volumes using a centrifugal pump and samples were collected using disposable polyethylene bailers. During well purging, field parameters for pH, electrical conductivity and temperature were monitored using calibrated field meters.

Groundwater samples were collected in 40-milliliter glass vials preserved with hydrochloric acid and one-liter non-preserved amber glass containers and placed in an ice-filled cooler for shipment under chain-of-custody to a State of California certified laboratory. A trip blank was submitted on December 14, 2001 for analysis by EPA Method 8021B.

Groundwater Analytical Results

Table 2 presents groundwater analytical results for the December 2001 sampling event. TPH was detected in all three wells at concentrations ranging from 160 to 670 parts per billion (ppb). MTBE was detected in wells MW-12 and MW-13 below the California maximum contaminant level for drinking water of 13 ppb. No analytes were detected in the trip blank or method blank. A lab control spike and lab control spike duplicate passed the EPA's criteria for acceptance.

SUMMARY OF RESULTS

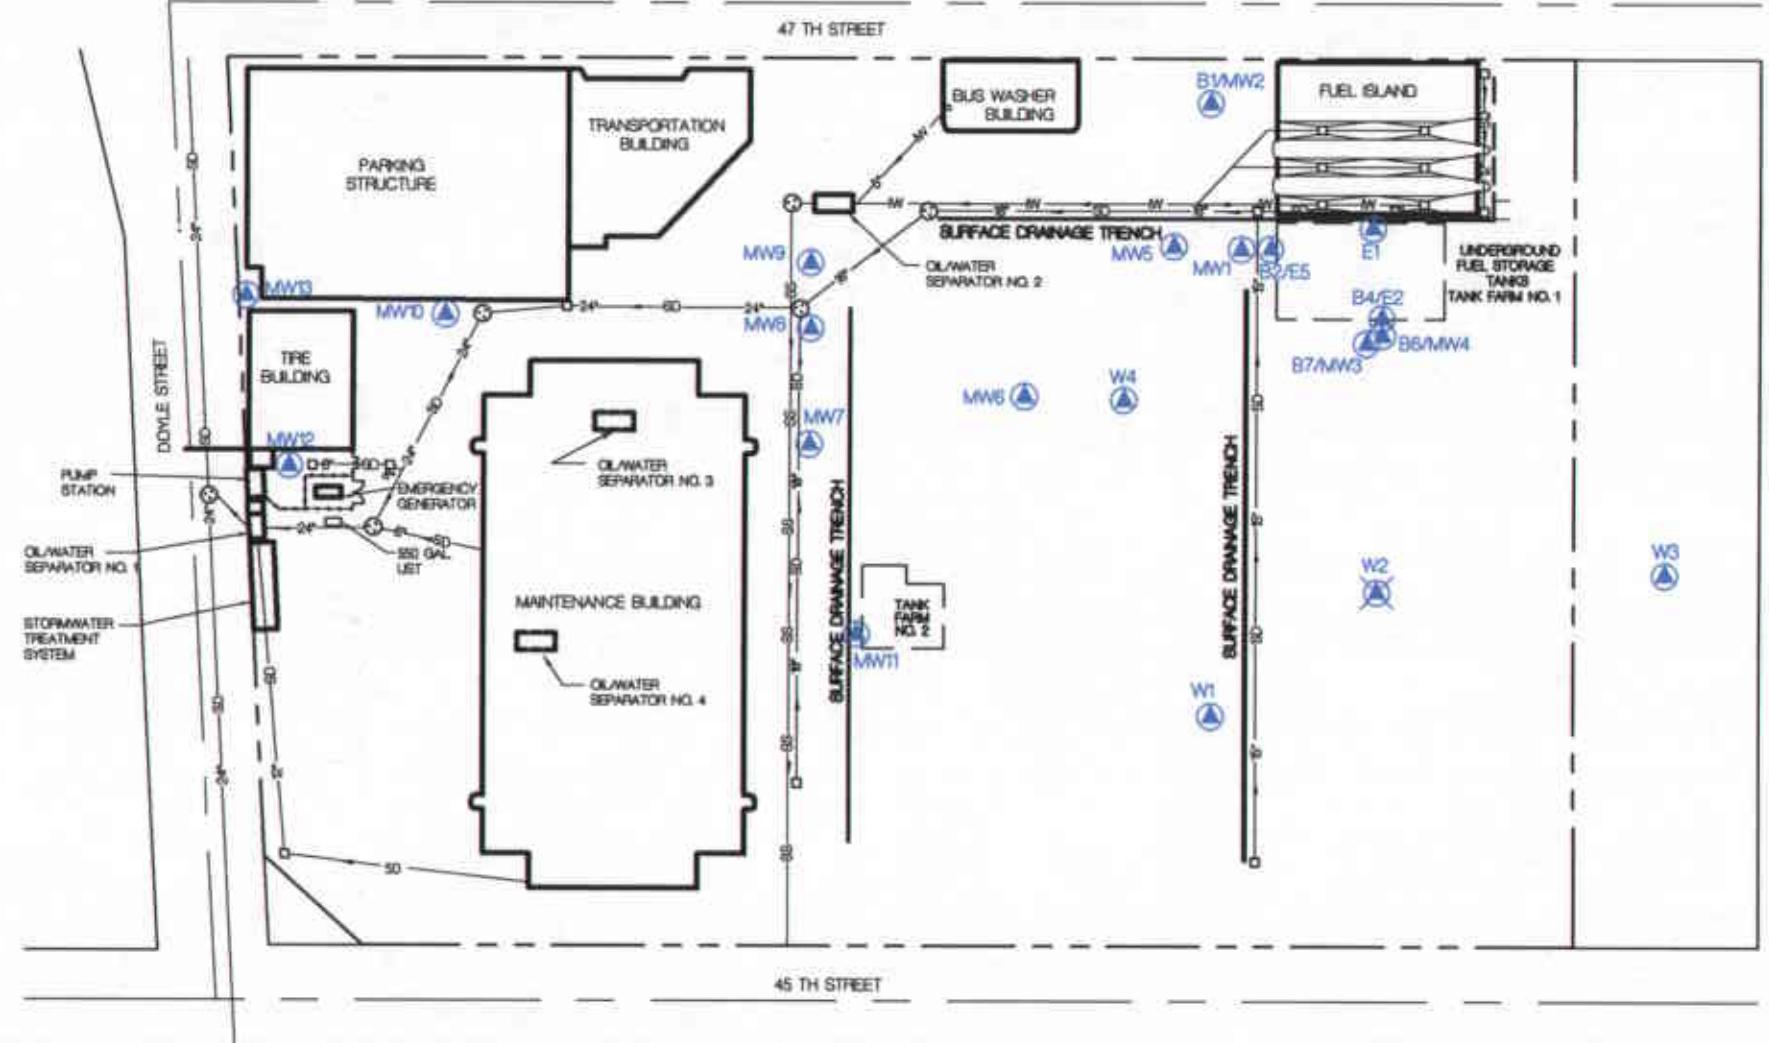

- Groundwater flow is to the west at a gradient of 0.02 feet/foot.

- TPH as degraded diesel was detected in MW-11, MW-12 and MW-13 at 320, 170 and 160 ppb, respectively.
- TPH as degraded gasoline was detected in MW-12 at 670 ppb, respectively.
- MTBE was detected in MW-12 at 9.4 ppb.

- MTBE was detected in MW-13 at 11.0 ppb.
- Benzene, ethylbenzene, toluene and xylenes were below reporting limits in all wells sampled.

PROJECTED WORK AND RECOMMENDATIONS

- Semi-annual groundwater monitoring of all Site monitoring wells is scheduled for February 2002. This event will include Site-wide depth to groundwater level measurements, including inspection of each monitor well for free-phase hydrocarbon.

Brad Wright
Cameron-Cole LLC
101 West Atlantic Avenue
Building #90
Alameda, CA 94501

Dear Mr. Wright,

This report contains the analytical results for the samples received under chain of custody by STL Sacramento on December 14, 2001. These samples are associated with your AC Transit Emeryville project.

The test results in this report meet all NELAC requirements for parameters that accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The case narrative is an integral part of this report.

If you have any questions, please feel free to call me at (916) 374-4414.

Sincerely,

Bonnie J. McNeill
Project Manager

 Laboratory QC Reports

CASE NARRATIVE

STL SACRAMENTO PROJECT NUMBER G1L140394

General Comments

Samples were received at 3 degrees Centigrade.

WATER, 8015M, TPH Gas

Sample(s): 2, 3, 4

The original analysis within holding time for the samples had continuing calibration verifications outside of acceptance criteria. The samples were re-injected, outside of holding time, for confirmation purposes. Results for samples 002 and 004 confirmed the original results. Sample 003 demonstrated low surrogate recovery and an unknown hydrocarbon at 2 times the original analysis. Sample 003 was re-analyzed a third time and the results confirmed the first re-analysis. Both sets of data are reported for samples 002 and 004 and the first and last are reported for sample 003.

WATER, 8015 MOD, Diesel/Motor Oil

Sample(s): 2, 3, 4

There was insufficient sample volume to prepare an MS/SD pair with this batch. A second LCS was prepared instead.

There were no other anomalies associated with this project.

STL Sacramento
Quality Control Definitions

QC Parameter	Definition
QC Batch	A set of up to 20 field samples plus associated laboratory QC samples that are similar in composition (matrix) and that are processed within the same time period with the same reagent and standard lots.
Duplicate Control Sample (DCS)	Consist of a pair of LCSs analyzed within the same QC batch to monitor precision and accuracy independent of sample matrix effects. This QC is performed only if required by client or when insufficient sample is available to perform MS/MSD.
Duplicate Sample (DU)	A second aliquot of an environmental sample, taken from the same sample container when possible, that is processed independently with the first sample aliquot. The results are used to assess the effect of the sample matrix on the precision of the analytical process. The precision estimated using this sample is not necessarily representative of the precision for other samples in the batch.
Laboratory Control Sample (LCS)	A volume of reagent water for aqueous samples or a contaminant-free solid matrix (Ottawa sand) for soil and sediment samples which is spiked with known amounts of representative target analytes and required surrogates. An LCS is carried through the entire analytical process and is used to monitor the accuracy of the analytical process independent of potential matrix effects.
Matrix Spike and Matrix Spike Duplicate (MS/MSD)	A field sample fortified with known quantities of target analytes that are also added to the LCS. Matrix spike duplicate is a second matrix spike sample. MSs/MSDs are carried through the entire analytical process and are used to determine sample matrix effect on accuracy of the measurement system. The accuracy and precision estimated using MS/MSD is only representative of the precision of the sample that was spiked.
Method Blank (MB)	A sample composed of all the reagents (in the same quantities) in reagent water carried through the entire analytical process. The method blank is used to monitor the level of contamination introduced during sample preparation steps.
Surrogate Spike	Organic constituents not expected to be detected in environmental media and are added to every sample and QC at a known concentration. Surrogates are used to determine the efficiency of the sample preparation and the analytical process.

Notes(s):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity, pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight
